THE INTERMEDIATE HOUSE.—*Odontoglossum grande* does well in this house, and at present has about half made up its new growths. This *Odontoglossum* does not like too much water at any time, even when growing strong; if at all overdone, the young growths will go spotted, and the plants quickly lose its roots. Any plants that are now growing clean and strong will be improved by a little guano rubbed into the water before using, at the rate of about 2 oz. to the gallon of water; this, if followed for the next two months, will improve the size of the flower-spike. *Miltonia vexillaria* that have not already been repotted should be done at once. Our own plants are always repotted during the early part of August; this gives the plants plenty of time to get established before the winter sets in. The most proper way to water these plants is by the syringe, and the only time when care is necessary is immediately after repotting. If the potting compost, which should consist of peat, sphagnum, and either coarse silver sand or potsherds, broken small, is moist at the time of use, no water will be required at the root for a week or two, that which falls from the foliage of the plants being ample to keep the roots sufficiently moist. *Pleiones* must now receive an ample supply of moisture at the root, also manure-water should still be given the plants until they are taken from their growing quarters for resting purposes. Much depends upon when these plants are required in flower, they are easily kept back to a late date by keeping them growing, but once they are taken out into a resting-house, nothing that does not materially affect the size of the flowers will keep them back afterwards. These plants are in many cases even yet kept dry when resting; this is undoubtedly a great mistake, for if the roots are allowed to die entirely, the size of flower and the healthy condition of the corals will both suffer. *Vanda cuculea* is now sending up spikes; this is one of the most unsatisfactory plants to grow of the whole genus, and yet one of the most beautiful.

I have grown this plant for a number of years with varying success; for two, three, and in some cases four years after these plants have been imported the growth and the flowering have been perfectly satisfactory, then when the right treatment has seemed to have been found the plants refuse to grow, but if placed into a warmer house, spotting of the foliage quickly ensues. The best plants I ever grew of this *Vanda* was in a position where the door could be thrown open upon them for five months in the year, the side and top ventilators also being open; the plants were frequently syringed overhead. *Vanda tricolor* and *V. savais* will now likely send up spikes of flower. These become very useful now that Orchid flower is short, but should these plants be required to make a good show during the spring, or for exhibition purposes, the spikes should be removed as soon as they show themselves. Few plants are likely to suffer more than *Vandas* from being allowed to over-flower themselves. These plants should now receive a good syringing at least twice daily; more especially is this necessary where plants have lost several leaves after the last season's flowering. This will assist in getting a larger number of roots from the bare stems. The plants may be cut down to bring the foliage down to the level of the pot when the potting season comes round. No change will be necessary in the temperature for the different departments from that given in a previous Calendar. *A. G. Catt, Parkfield, Hollow.*

THE FLOWER GARDEN.

HERBACEOUS PLANTS.—The recent rains have greatly benefited herbaceous plants. Plants of early-flowering varieties of the *Potentillas*, which were cut down as soon as done flowering, are now sending up a profusion of dwarf sturdy flower-spikes which are well furnished with their pretty green leaves. Cut out all decayed flower-stalks and leaves from among the fresh foliage, and gather seeds of choice flowers as they ripen. Continue to tie up flower-stems that require support, and train climbers over the space allotted to them, the points of the shoots being allowed to hang somewhat loosely and informally. Rock plants should be kept within their limits, the same remark applies to the tall strong-growing ones, as each plant should be allowed due space to develop and show to advantage its special features.

ARRANGING THE COLOURS FOR 1892.—The present or any time within the next few weeks will be a good time to note down any alterations contemplated being made in the floral picture next year. My practice is to make a plan of the flower garden, and, when the display of flowers is at its best, enter thereon the names of the plants which are to be put into each bed the following summer. The beds on one side of the central walk in our Italian garden being a facsimile of those on the other, they are, therefore, filled alike in pairs, so that one side of the plan is devoted to the arrangement or composition of the beds for the ensuing summer, and the other half to that of the spring-flowering plants, noting down, in April, what description of plants are to replace the summer occupants of the beds the following October or November. We then propagate the several kinds and varieties of the needful plants, in proportion to the arrangements thus made; and when planting time arrives, there is no time lost in determining "what we shall put in this bed, and what in that," and in wondering whether we have enough of such and such plants to do so. There is no working in the dark. The necessary quantity of each kind is previously known, and propagated accordingly, with a liberal allowance for any mishaps that may occur before planting time arrived. One plan made on stout drawing paper will last several years, as the pencil writing of the previous autumn and spring can be easily erased.

GENERAL WORK—This will consist in clipping Box edging, Thorn hedges, &c. The latter are not always cut into so good a shape as they might and should be. In some few cases it is necessary to cut Yew hedges square at sides and top, so as to be in character with surrounding objects; but in a general way they should be cut into a rounded point on the top, sloping gradually from mid-height of hedge, giving a section representing a semi-elliptical figure. Hedges thus cut, as they are on this estate, and in most of the nursery grounds in Edinburgh and further north, are always thick and well furnished from the ground, and look well. *H. W. Ward, Longford Castle, Salisbury.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

WEDNESDAY,	AUG. 19.	{ Trowbridge. Shrewsbury (three days).
THURSDAY,	AUG. 20.	{ Aberdeen (three days).
FRIDAY,	AUG. 21.	{ Brechin (two days). Devon and Exeter.
SATURDAY,	AUG. 22.	{ Leith.
SUNDAY,	AUG. 23.	{ Cercle Van Houtte, Ghent, opens (eight days).

SALES.

MONDAY,	AUG. 17.	{ Special trade sale of Dutch Bulbs at Protheroe & Morris' Rooms.
WEDNESDAY,	AUG. 19.	{ Dutch Bulbs, at Stevens' Rooms.
THURSDAY,	AUG. 20.	{ Special trade sale of Dutch Bulbs at Protheroe & Morris' Rooms. Orchids in Flower, at Stevens' Rooms.
FRIDAY,	AUG. 21.	{ Imported and Established Orchids at Protheroe and Morris' Rooms.
SATURDAY,	AUG. 22.	{ Dutch Bulbs, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—61°·8.

THE extension and improvement of fruit culture in this country are attracting great attention just now. When the subject was first started, the fair prospects were well nigh ruined by exaggerated statements and theories based on imperfect or defective evidence. A more wholesome state of things now prevails. People are beginning to find out that the Royal Horticultural Society has for many years past done excellent service, and that a very large proportion of the information we have about fruits and fruit culture has emanated from Chiswick; whilst the Fruit Conferences that have been held there, as well as in Edinburgh and elsewhere, and the reports that have been published since, have placed in the hands of the public a vast amount of trustworthy information. The Fruiterers' Company, by giving publicity to Mr. WRIGHT'S prize essay, has greatly helped on the work. The British Fruit-Growers' Association has also been most active in diffusing information of the right kind, and publishing it in the right quarters. The proceedings of the Beddington Conference, held under the auspices of the last-named Society, have already been noted by us. Arising out of that, a scheme of education comprising an elementary knowledge of plants and their ways of life, and gradually passing on to the technical details of cultural operations, has been prepared by the Society for submission to the Education Department,

and there is every probability that it will be adopted in the rural schools. If this scheme works well, as we believe it will do, a very important step will have been taken, and one which will grow and develop, so that we shall eventually have a trained band of teachers, capable of going from place to place to demonstrate to the cottagers and small cultivators the best methods of cultivation, the best sorts to grow, and other matters of interest to them. In fine, we shall be adopting what Belgium, France, Germany, and other countries have already done, to the great benefit of the country districts.

At Cardiff also, this young and energetic Society has this week shown evidence of its power for good. Mr. E. J. BAILLIE'S paper on "Fruit Growing as an Industry," was an excellent sample of an introductory address. Mr. BAILLIE dealt with facts which we need not repeat here at length, as our readers are familiar with them—facts, however, which need repeated presentment on the spot in the rural districts. We may, however, extract a few sentences which show that Mr. BAILLIE is on the right track. "Fruit-growing as an industry," said he, "is working for a living, not riding a hobby, or playing with a fad;" moreover, it is a productive industry, not an employment or occupation that can run itself, or that can be run under the so-called superintendence of a lazy fellow, or of one who lacks method, or lacks knowledge of a particular order. "In these days," continued Mr. BAILLIE, "it too often happens that spasms of speculation are indulged in instead of sustained occupation. A nibble at some commission in the morning, a juggle with a share list at noon, a manipulation of some mining venture, or a transfer of some stocks, characterise rather than caricature phases of what come to be called (for show of respectability) modern commerce."

Mr. BAILLIE further pointed out, that this matter of fruit culture is much more horticultural than agricultural—the fruit cultivator must be a good gardener. The lecturer then proceeded to expatiate on the requirements of the case, both as regards men, trees, and soil, and insisted on the necessity for growing the best of its kind in the best way. First-rate quality should be aimed at, and fruit should be bought by sample as grain and other produce of the earth is sold. The method of dealing with orchards infested with insects was expatiated upon, and the lecturer ended with an eloquent peroration, laughing at the foolish fears and doubts of the pessimist, and advocating the rational extension of fruit-culture not only for financial reasons, but also on the higher grounds of the physical and mental welfare of the cultivator.

"There are weary eyes aching over the needle night after night, to these there is little to look at of this beautiful world—only the dull dim street. There are heavy hearts which hear no semblance to music, save the dinner-bell at the factory; there are languishing spirits in close crowded courts fainting for the breath of the breeze. Toilers these in the towns whose lives are almost without hope. Open the gates of Arcadia! Lead the children out into a peopled paradise! How grandly then would everything go in the way which those who had eyes to see know must be right? Coming face to face with the fair freshness of Nature, how we can strike off the chains that bind humanity down to the dull routine of a mechanical existence of a sunless life, when smoke and chimneys take the place of sunlight and trees, and the hissing of steam and the fumes of chemicals torment and stifle those who might find freedom and fulness of life in work of the orchard and the garden, or rest in the shelter of the grove."

Mr. POTTIGREW'S paper, thanks to the courtesy of the Hon. Sec., is given in full in another column, where its thoroughly excellent qualities will commend it to the notice of practical men.

English Orchid Growing.

ENGLISH Orchid growers, it appears, must hide their diminished heads. The editor of the *Journal des Orchidées* has paid several of our establishments, public and private, a visit, and has arrived at the conclusion that on the continent, and especially in Belgium, there are much better cultivators of Orchids than are to be found (barring exceptions, such as that of Mr. MEASURES) in London. M. WAROCQUE'S collection, for instance, is extolled at the expense of that of Baron SCHRODER.

As to the commercial establishments, the impression made on our visitor was one of "bad cultivation, want of system (*ordre*), and cleanliness. The majority of the houses are badly kept, the pots and stages are dirty . . . the culture is not good, and is not to be compared with that of the principal commercial establishments of Belgium." *Odontoglossums* in particular excited our colleague's animadversion—pseudobulbs not larger than pigeon's eggs, feeble inflorescence, flowers badly developed, and of bad shape. We should have supposed the visit had been paid in the course of one of our November fogs, but the writer attributes our deficiencies to want of air, too high a temperature, and to the employment of peat. Some of the best specimens he saw in England were of Belgian origin, which is, he says, not surprising, as it will not be easy to find in London *Odontoglossum* cultivation corresponding to that of the Horticulture Internationale, or of MM. VERVAET, VINCKE, VUYLSTÈRE, PEETERS, and MORREN, in Belgium; or that of DUVAL and TRUFFAUT in France. Such slashing criticism has, *ipso facto*, an element of weakness about it, and it will certainly not be entirely acquiesced in. The paucity of new plants also struck our contemporary. All of which *donne à penser!* Our Orchid growers are well able to take care of themselves.

ANCIENT SOCIETY OF YORK FLORISTS.—Under the auspices of the Society, commemorative services were held on Sunday last, in the church of St. Michael le Belfrey. The handsome interior of the edifice lends itself admirably to floral decoration, and in the skilled and willing hands of several of the members of the Society, was made to assume a very beautiful appearance, in fact, pronounced most beautiful by very many appreciative admirers. In the morning, the vicar, Rev. E. S. CARTER, preached, basing his discourse on the words "Consider the Lilies." In the afternoon the chaplain of the Society, Rev. F. UMPLEBY, preached from the words, "If God so clothe the grass, which is to-day in the field." The Very Rev. the Dean of YORK preached in the evening, from the words, "the fruit of the Spirit," the several discourses being made appropriate to the occasion. The choir also rendered good service, being specially augmented; the anthem "The Wilderness" (Goss), was sung in the afternoon and again by desire in the evening, the soloists being Messrs. WILKINSON, HAGYARD, SUTCLIFFE, COX, and Master LEE, of the Cathedral choir. At the close of the evening service, Mr. A. SAMPLE, the organist, gave an organ recital, which most of the congregation remained to hear, with manifest appreciation. A great number of people remained in the church until quite a late hour, seemingly charmed with the scene presented. The offertories at each of the services were in aid of the County Hospital and York Dispensary, about £10 being realised, which makes no less a sum than £30, which this Society has obtained for charitable purposes within the last three years.

THE SILVA OF NORTH AMERICA.—The second volume of Professor SARGENT'S classical publication on the trees of North America is before us. It is devoted to the description and illustration of trees belonging to the following orders: Cyrillaceæ, Celastraceæ, Rhamnaceæ, and Sapindaceæ, some fifty in all. We have already expressed our opinion of the substantial value of this work, both as regards the text and the illustrations. The value of illustrated works is often quite disproportionate to the cost and labour expended in their production. To those who

ample index of these notes given us hereafter. The plates are remarkable for their faithfulness, and for the careful presentation of those details so serviceable to the botanist, but which are, not unnaturally, ignored by the non-botanical artist. One of the most interesting genera treated of in the present volume is *Acer*, or Maple, of which sixty or seventy species are known, the largest number being found in Japan. In North America, with which alone the present volume is concerned, there are nine, five of which belong to the Atlantic, two

palmatum, Rafinesque, *New Flora*, 1:48 (1836), not of Thunberg." The additional trouble to the author would be trifling in comparison to the convenience conferred on the reader. The true Sugar Maple is referred to as *A. barbatum*, of Michaux, and a long footnote gives details as to the preparation of the sugar from its sap. The *Acer saccharinum* of Linnaeus, it appears, is the Maple, best known to us as *A. dasycarpum*, or sometimes as *A. eriocarpum*, otherwise Sir CHARLES WAGER'S Maple, an excellent town tree. *A. negundo* is also an excellent town-tree.

FIG. 25.—PALM HOUSE, WELBECK GARDENS. (SEE P. 1-5.)

only aim at the production of a drawing-room table book, and to those who desire nothing else, this may not be of consequence, but when a more serious purpose is in view, the result is vexatious. Professor SARGENT'S book is intended for use and research. It abounds with information, the notes in particular being replete with curious and valuable observations. Among them we may note biographical notes on the principal botanists of past times connected with the plants described. It is to be hoped that we shall have an

to the Pacific region, one is peculiar to the central mountain ranges, and one extends across the Continent. The Sycamore, *A. pseudo-platanus*, does not thrive in the United States, nor are the Japanese ones capable of adapting themselves permanently to the climate. The Norway Maple, *A. platanoides*, makes itself quite at home. It would be useful if Professor SARGENT would, in succeeding volumes, give the date of the original establishment of each species thus, "*Acer macrophyllum*, Pusth, Fl. Am. Sept. 1:267 (1814); *A.*

The white-leaved Maple, so common now in our gardens, is only a variegated form of this species, although many people speak of it as of Japanese origin.

MESSRS. LAING & SONS.—The *employis*, numbering eighty, of the firm of Messrs. JOHN LAING & SONS, nurserymen, Forest Hill, had their annual beanfeast on the 7th inst. Journeying from Forest Hill Station, they reached Eastbourne shortly after 10 A.M., when each one amused himself according to

his own fancy until 1 o'clock, when all assembled at the Lamb Hotel to dinner. After dinner all again went their own way, meeting at Eastbourne Station at 8.30 p.m. for the return journey, reaching Forest Hill about 10.30 p.m., all being thoroughly satisfied with the day's outing.

THE CONGRESS OF HYGIENE AND DEMOGRAPHY.—At this important meeting, papers were read on town smoke and fogs, open spaces, heating towns by steam, preventible diseases, &c. The very large proportion that the latter bear to the total is a disgrace to our civilisation, and furnishes the best answer to those who, with a want of due sense of proportion, endeavour in all honesty to obstruct the progress of knowledge, and to perpetuate disease and misery which might be obviated.

MR. W. J. GRANT.—We understand that this gentleman, so well known in the Rose world as a very successful amateur grower and exhibitor, has been appointed by the Monmouthshire County Council to superintend the department they have created for Agriculture, Horticulture, and Forestry. Mr. GRANT for some years managed the fine estate of Hope Ead, Ledbury, and the knowledge that he there brought to bear on every kind of farming, the management of stock, &c., combined with his well-known business habits, have no doubt been the cause of his obtaining this honourable and responsible position. He will devote himself to developing the resources of the county, and we are sure that all who have known him will wish that he may be many years spared to fulfil the duties of the post to which he has been appointed. Since leaving Hope Ead, he has been connected with the English Fruit and Rose Company; but his present position is one much more suited to his varied talents and acknowledged ability.

DECAYING OF PEACHES.—We have received samples of Peaches and Nectarines which prematurely dropped, and which discoloured and rotted without any signs of fungus, except the mould which is usually found on rotten fruit. The stone was in some, but not all cases, split. Can any of our Peach growers suggest a cause and remedy for this not uncommon malady?

THE BRIGHTON AND SUSSEX NEW HORTICULTURAL AND MUTUAL IMPROVEMENT SOCIETY, and the Brighton and Hove Chrysanthemum Society, will amalgamate for their annual outing on August 18, when they intend visiting some of the leading places at Redhill and Reigate, including Gatton Park, Wray Park, the Great Doods, Woodhatch Lodge, High Trees, &c. Weather permitting, the party will leave Brighton at 7.50 A.M.

THE TREATMENT OF DISEASE IN PLANTS BY MEANS OF COPPER COMPOUNDS.—The salts and other compounds of copper appear likely to occupy a place in horticultural science, next in importance to that of manures. A mixture of lime and blue vitriol (copper sulphate) has been employed for some time with success as a germicide in the treatment of the diseases of the Potato, the Tomato, and the Vine. Within the last few months, Mons. AIMÉ GIRARD has been applying this mixture to the Sugar-Beet, in cases where the roots have been attacked with the disease known as *Peronospora Schachtii*. Solutions of lime and copper sulphate, each containing three per cent., are mixed and then sprayed over the crop, and there is evidence to show that the disease has been effectually checked, for the fungus to which it is due appears unable to live after being damped with this solution. The use of lime along with the copper-salt has been supposed by some to be quite unnecessary; but this is not the case, for some recent experiments made by Signor E. FORMENTO, show that the copper cannot reach the inner parts of the plants by dialysis, except when the salt is mixed with lime. He made experiments with the Vine and other plants in determining the manner, and the extent of the absorption of

copper by vegetable tissues. Since it is now established that plants can assimilate metallic compounds with readiness, the effect of using copper-salts for germicidal and insecticidal purposes should be watched with care in the case of food-plants like the Sugar-Beet, the Potato, cereals, &c., for copper is known to exercise a toxic effect upon the human economy. Of course, in the case of plants which are not used as food materials, it does not matter.

THEORY AND PRACTICE.—Nothing is more common than to hear the "practical" man denounce theory, and loudly asseverate his opinion that an ounce of practice or of fact, as he calls it, is worth a ton of theory. Of course, the value of a theory is directly proportionate to the accuracy with which the facts have been observed and correlated; but, as a general rule, it will be found that the practical man is the wildest theorist. The explanations he gives, say, of the phenomena of plant-life, are often astounding—the deeds of the sap being something far beyond the comprehension of the physiologists. We append a good illustration of the practical man's theory. Evidently the writer had to deal with Plums diseased and distorted by a fungus (*Exoascus pruni*), so often figured and described in these columns. But here is the explanation given of these bladder-Plums: "In the Hon. Captain COCHUANE'S garden at Redcastle, some Beans are growing under a Damson Plum tree, and, while both were simultaneously in blossom, the bees appear to have carried the pollen from the Beans to the Plums, with the result that a large quantity of the fruit is a hybrid between Damsons and Beans. The Plums are shaped like Beau pods, being elongated and hollow, but containing neither stones nor beans. One or two of the pod-Plums, which we have seen opened, showed what appeared to be the rudiments of what might be either a stone or a bean. Of course the fruit so changed is entirely useless for any purpose." Similar theories are invoked to explain the cup-shaped Foxgloves—these are generally attributed to crossing with a Canterbury Bell. A lady correspondent, year after year, used to send us specimens of Violets affected with the parasitic fungus, *Ecidium violæ*. These Violets grew beneath the shadow of some Ferns, *erygo*, the Violets were crossed with the Ferns. Were not the brown spots conclusive evidence? We ventured to think not, but our correspondent returned to the charge, and refused to be convinced that her interpretation was not the correct one. These persons belong to a class who vehemently oppose evolutionary theories, but nevertheless formulate theories of their own, so baseless that not the wildest of speculative evolutionists could entertain them.

THE RELATIVE ACTIVITY OF GREEN AND RED LEAVES.—Mons. JUMELLE, of the Paris Academy of Sciences, has been comparing the relative activity of green and other coloured leaves by exposing them to sunlight under comparable conditions in a closed atmosphere containing a known quantity of carbonic acid gas, and then determining how much of this gas was decomposed. The results show that in trees with red or coppery leaves, the chlorophyllian assimilation is always lower than in the same tree with green leaves. This explains the well-known fact that trees of the former class increase in size much more slowly than those of the latter. In some cases the differences are very great; thus, the assimilation of the green Beech is about six times as great as that of the copper Beech, and there is the same difference between the ordinary and the purple Sycamore trees.

THE ACQUISITION OF ATMOSPHERIC NITROGEN BY PLANTS.—A large number of experiments has been carried on during the past few months by ATWATER, which confirm the view that nitrogen is readily absorbed from the atmosphere by certain plants when treated with "soil-infusion," and that the gain of nitrogen is dependent on the number of root-tubercles which the application of this liquid

induces. SCHLOESING and LACERENT have also been carrying on an investigation into the same subject, and with similar results. In commenting upon the results of these researches, BERTHELOT states that he regards them as a final proof that under the influence of microbes, leguminous plants can utilise and fix the gaseous nitrogen of the atmosphere.

DAMAGE FROM ALKALI WORKS.—An important case affecting the alkali trade was concluded at Chester Assizes lately, after a two days' hearing. WILLIAM BOOSEY, nurseryman, of Middlewich, sued the Cheshire Alkali Company to recover damages for injuries done to his nursery by powders and gases given off by the defendants' works. Plaintiff has 12 acres of nursery ground at Middlewich, and alongside these the defendants constructed alkali works. It was proved that the bicarbonate of soda escaped from them and seriously damaged the nursery. The jury awarded plaintiff £500 damages.

FUMIGATING FRUIT JARS.—MR. WARREN of Isleworth, as a large fruit grower, has of course at times considerable surplus fruit, which he finds it needful to utilise himself rather than send it to market, when the returns are practically *nil*; hence he boils down much of it into pulp and preserves it in large but narrow-mouthed jars for the jam makers in seasons when the scarcity of fruit creates a demand for pulp. Formerly, Mr. WARREN did bottling largely, but the introduction of the canning process in America has materially discounted the value of bottled fruits. The jars in question hold, perhaps, about six or eight quarts; they are all thoroughly cleansed and stood for use when needed. But as no sugar is added to the pulp, and as it is important that all fungoid germs be fully destroyed before the jars are filled, it is the rule to dip into a solution of sulphur long strips of calico, one half their length; these strips are, when dry, ignited at the sulphur end and dropped into the jars, but the other ends are kept in the mouths by the large corks or bungs which are fixed into the mouths immediately the jars are filled with the sulphur fumes. These fumes are so powerful as to destroy all fungoid life within the jars, and so soon as found to be ready for use the corks are removed, the strong sulphur fumes rushing out check the ingress of air, and the vacuum thus created is immediately filled by the boiling pulp. This is at once tightly corked down, and will in that state keep for even a couple of years in good condition. Soft fruits, such as Gooseberries, Currants, Raspberries, Strawberries, and Plums are thus preserved. Market dealers object often to Saturday-gathered fruit, hence most of this is boiled down.

MR. BOWERMAN, HACKWOOD GARDENS.—Many of our readers will, with us, regret to learn that this estimable gardener has been compelled to give up his supervision of the fine gardens at Hackwood Park, Basingstoke, for three months, his medical advisers having ordered absolute rest.

SMOKING IN THE BOTANICAL GARDENS, REGENT'S PARK.—At the annual meeting of the Royal Botanic Society, Regent's Park, on Monday last, Mr. EDWARD LEDGER, a Life Fellow of the Society, protested against the restriction against smoking in the gardens, and pressed on the Council the necessity of removing the objectionable rule.

MESSRS. LAIRD & SINCLAIR, OF DUNDEE.—The employes of this firm held their annual picnic on Wednesday, Aug. 5, in the grounds of Craighall, Blairgowrie, Perthshire, the residence of Gen. CLARK-RATFRAY. The party to the number of forty proceeded in brakes from Dundee, where a very enjoyable day was spent.

ORCHIDS TO NAME.—We learn that the number of Orchids named at Kew for orchidists amounts to about nineteen in each week, the total thus approxi-

mating to a thousand a year. That so great use is made of the herbarium by the gardening fraternity is very satisfactory—we could wish that others besides orchidists would avail themselves of their opportunities in equal proportion. But as the necessary researches often occupy much time and labour on the part of skilled experts, it is obvious that if the work of the department is to be carried on, a considerable increase in the staff must take place. For our own parts, we should like to see a staff of three or four trained assistants told off to act solely as the go-between the herbarium and the garden—to ascertain the correct names of the plants in the garden, as well as of those submitted to them by the public, to see that the plants of all descriptions were kept adequately and correctly labelled, that specimens were preserved for drawing or for drying, and to prepare an authoritative *Hortus Kewensis* with the assistance of the other members of the staff.

STRAWBERRIES.—Ninety-four tons of Strawberries were conveyed to Glasgow in two recent consecutive days by the Caledonian Railway Company.

RESEARCHES ON THE MANURING OF SOILS.—A German contemporary gives some account of recent researches by T. LEONE on the manuring of garden soils. From a series of exhaustive experiments, this scientist concludes that the phenomena of nitrification and denitrification in soil are due to the activity of certain bacteria or micro-organisms, and they occur in alternation according to the amount of nutriment capable of sustaining the life of these tiny beings present in the earthy matters. Thus, when an abundance of nutritive material is at hand, the rapid development of the bacteria is accompanied by the oxidation of substances which are called proteids, and this takes place partly at the expense of the oxygen in the nitrates present, with the result that ammonia and nitrites are formed. On the other hand, nitrification commences as soon as the decomposable nitrogenous products are either assimilated or are converted into ammonia compound. If this be true, then the effect of manuring soil would be in the first instance to suspend the ordinary process of nitrification, and to convert part of the nitrates present into nitrites, nitrification only recommencing when the organic matter was decomposed, and the formation of ammonia had attained a maximum. The manuring of soils, therefore, gives rise to a cycle of phenomena, and the destruction of the nitrates or nitrites in the soil is complete or partial according as the supply of manure is abundant or otherwise.

THE FORMATION AND PROPERTIES OF HUMUS.—The black organic matter of soils called humus is due to the decay chiefly of vegetable matter. This decay is brought about by the attacks of moulds and bacteria, the former alone causing the production of dark-coloured matters. P. A. KOSTYTCHEFF has recently been investigating this subject, and has been experimenting with various kinds of vegetable *débris*, e.g., grass, Oak, Elm, and other leaves. He found that as these matters decayed, there was invariably no loss of nitrogen. Now grass and leaves contain proteids, and these decompose into ammonia, a gas which partly consists of nitrogen, and since there is no loss of nitrogen, it follows that the ammonia must be reconverted into other substances, and this appears to be done by the agency of living organisms, which find their nourishment in the decaying matter. Ammonia and similar substances serve as nutriment to moulds, in the protoplasm of which their nitrogen is stored up, and this decomposing in its turn serves as food to bacteria, which still retain the nitrogen in proteid combinations. The soil, with its estimated 60,000,000 of organisms per gramme, must contain much nitrogen in the proteid form, and one set or other of organisms will predominate according to variation in the conditions. In general, the first development in decaying vegetable matter is that of bacteria, the medium becoming acid; then follow the decay of these

bacteria, the ammonia produced neutralising the acid, and moulds growing in the neutral medium; afterwards bacteria and moulds develop together. Thus, humus always contains easily decomposable matter, and consequently, the rate of decomposition observed at any period of the decay is about the same. In humus produced above the water-line, all trace of vegetable structure is destroyed by the leaves being gnawed and passed through the bodies of earthworms, caterpillars, wireworms, &c.; under the waterline, the vegetable structure is preserved, and peat results. Experiments with dead leaves pulverised by the action of these animals, in comparison with the same leaves not attacked by them, show that little or no influence on the rate of decay results from their action. After passing through their bodies, the organic matter is still fit to nourish moulds and bacteria, and when these have multiplied sufficiently to accumulate a fresh stock of protoplasm, the earthworms, &c., attack it again, and so destroy all trace of structure. The soil of black lands is permeable to a small depth only by water, and this circumstance retards decomposition, and accounts for the accumulation of humus. The decay of humus is fastest in the best drained and most open soils; for this reason, the presence of clay in a soil promotes the accumulation of humus. Woods promote drainage by loosening the soil and abstracting water, and hence in plantations the accumulation of humus is retarded, and the earth becomes lighter in colour. Inferior organisms are a means of diffusing organic matter throughout the soil—the mycelia of fungi, for instance, growing on a dead root, ramify laterally, and thus carry organic matter a little outward; succeeding organisms extend this action, and the soil becomes darkened in proportion. The humic acid of black soil is almost exclusively in combination with lime; this lime is, according to KOSTYTCHEFF, carried to the insoluble humus as acid carbonate dissolved in the water, and the acid carbonate is decomposed by contact with the moist humus. KOSTYTCHEFF is a member of the Society of Naturalists of St. Petersburg, and his paper, which is a long one, has been reproduced in several of our German contemporaries.

A NEW INSECTICIDE.—Hydrazine, a substance hitherto unknown outside the chemical laboratory, is stated by O. LOEW in the *Berichte der Deutschen Chemischen Gesellschaft*, xxiii., p. 3203, to exert an extremely poisonous action upon tiny organisms of the most varying description. A solution, containing only one-fifth of a gramme of hydrazine sulphate per litre of water, rapidly killed algae, fission organisms, moulds, schizomyces, and lowly types of water organisms. The substance, however, appears to be poisonous in its effects upon more highly-developed animals, such as dogs and guinea pigs, and there seems to be some reason for supposing that except in extremely dilute solutions, the effect of hydrazine upon the young shoots and buds or plants is deleterious. It would, however, be worth while making a series of experiments with solutions of known strength, in order to see whether hydrazine and its compounds may be turned to practical account in horticulture.

SUGARS IN MUSHROOMS.—Lovers of fungi may be surprised to learn that several species have been found to contain certain of the sugars. BOUQUELOT has recently been examining these fungi chemically. He finds that *Lactarius piperaus*, Scop., contains, immediately after it is gathered, a considerable quantity of a sugar called trehalose, and also a little of another sugar called by chemists mannitol. If, however, the fungus is dried before being examined, and then treated with water, no trehalose is obtained, mannitol alone being present. The same phenomenon is observed if the Mushrooms are merely kept for a few hours after being gathered, and hence the disappearance of the trehalose is a result of the continuance of the vital processes of the Mushrooms. Examinations of various species of

Mushrooms at different stages of growth show that when young they contain trehalose and no mannitol, in the middle period they contain both these sugars, and when mature they contain mannitol only. *Amanita mappa* is an exception, since in all stages it contains mannitol and no trehalose. The conversion of trehalose into mannitol is a process of reduction, and is probably connected with the formation and maturation of the spores. In many species the phenomena are complicated by an increase in the amount of glucose (Grape-sugar) that they contain, and in others by the appearance of glucose which is not present in the earlier stages of their growth.

PLANTS AS "CHEMICAL LABORATORIES."—In a paper on the assimilation of mineral salts by green plants, published in one of our German contemporaries, A. W. F. SCHMIDT states that the nutritive salts of the soil do not at once reach those parts of the plant when they are wanted, but are generally stored up in the root-stems and in the woody parts of the stems which are above ground. The seeds contain large quantities of salts, especially of the phosphates; they exist here as organic compounds, but during the process of germination they are again split up, and return to their original inorganic condition. The power possessed by plants of storing mineral substances differs very much qualitatively as well as quantitatively. The assimilation of nitric acid takes place in the green cells, and the nitrogen migrates chiefly in the form of amides and amidocids, which can be detected in the leaf parenchyma. The function of the lime appears to be to convert the poisonous potassium oxalate, which is found in considerable amount, into harmless calcium oxalate.

PRESENTATION TO MR. JOHN BAGALEY.—This gentleman, who for many years has been connected with Mr. BULL'S nurseries at Chelsea, and who has now joined the management of the Liverpool Horticultural Co. (JOHN COWAN, Limited), was on Thursday evening, the 30th ult., entertained at the Pier Hotel, Chelsea, to a farewell supper by his friends and members of the Chelsea Bicycle and Tricycle Club. He was presented with a beautiful gold demi-hunter watch in a case, and an address handsomely illuminated and framed.

"BOTANICAL MAGAZINE."—The August number contains figures of the following plants:—

Paralujya splendida, t. 7187.—A very handsome tropical climber belonging to the Verbenaceæ. It has large ovate-stalked leaves, and terminal many flowered cymes of irregularly 4-lobed funnel-shaped white flowers, from which the four stamens project. It is a native of North Queensland, and flowered last year for the first time in the Palm-house.

Cypripedium californicum, t. 7188.—A species with plicate leaves, flowers in terminal racemes, each about 1½ inch across, with greenish-yellow segments, and a white bag-shaped lip with a red spot. It flowered in the gardens of W. E. GOMPERTON, Esq.

Pleurothallis immersa, t. 7189.—A purple-flowered species, the scape of which is concealed at its base in the channel formed by the depression in the middle of the upper surface of the leaf.

Synantheris sibirica, t. 7190.—A very curious Indian Aroid with a single pedately cut leaf, the lobes of which are irregularly pinnately divided. The spathe is relatively short, widely tubular, acute, cream-coloured with green spots, the spadix with female flowers beneath, separated from the males by a single ring of neuter flowers, the apex of the spadix prolonged into a long slender cylindrical cream-coloured appendix destitute of flowers. Kew.

Rehmannia rupestris, t. 7191.—A trailing herbaceous perennial covered with thick white hair; leaves stalked, ovate; flowers sessile, 2½ inches long, with a short bell-shaped toothed calyx, and a long curved, tubular, pale yellow corolla, expanding at the top into a somewhat irregularly 5-lobed limb. It is a Scrophulariaceous plant introduced from the Mountains of Hupeh, Central China, by Dr. HENRY. Flowered at Kew.

HOME CORRESPONDENCE.

MORELLO CHERRIES.—Some of your correspondents, when giving particulars of hardy fruit crops in their districts, remarked upon the failure of their Morello Cherries, which they attributed in part to attacks of black-fly. I infer they cultivate them on conventional lines, upon north-aspect walls, a system which, however well it may answer in giving crops in a general way, is not of necessity the only one suitable to this invaluable fruit. A system which, in all probability, has become established owing to the fact that no other kinds of hardy fruit will succeed so well against such sunless cold walls. Though under proper culture very fine fruit of the Morello Cherry can be and is generally grown upon such aspects, it must not be forgotten that severe late frosts and attacks of aphid play more powerfully upon trees growing in such a position than upon others enjoying sunshine in larger degree. Though such adverse cropping conditions as I have noted above were given in a garden of repute little more than a mile distant from my own garden, I am bound to confess I never had a heavier or finer crop than this season. My trees, however, enjoy a sunny position upon an east wall. Black-fly attacked the tips of the shoots certainly in the month of June, and I had them dipped in tobacco-water, with the result that they disappeared, and I was no longer troubled by them. So much for the two crops, growing on dissimilar aspects in the same neighbourhood. What I am more anxious to advance, however, is the suggestion that all but certain cropping fruit could be made much more useful by varying the place of culture, *ie.*, planting the necessary quantities against north-aspect walls as before, also a fair number of trees upon east or west-aspect walls. My contention, as regards the latter, is that they crop more certainly and give supplies of ripe fruit for kitchen use, or bottling, some considerable time before those grown against shady walls are ready. I have thought it strange gardeners have not more generally planted standard Morellos. Not only are they most ornamental when in bloom, but most constant in cropping, and though in the ordinary way the fruits are small, even this may be readily remedied by somewhat severe pruning or thinning-out the young shoots each season. Moreover, standard Morellos commence fruiting freely the second year after planting, giving abundance of culinary fruit at a most acceptable season. Villa gardens having low walls which are not suitable to other fruits, because, whether Pears, Peaches, or Plums, the trees will not bear unlimited restraint, and are prone to advance their growth upwards beyond the limits of such low fences, proving in a very few years how useless all attempts at dwarfing them has been. Against such low fences, whether of brick, or wood, the Morello Cherry will succeed well. At least I have four such dwarf trees against a 6-foot high wall, covering a length of 17 feet, from the ground upwards, which have been planted between fifteen and twenty years. They have never missed fruiting heavily, the large Cherries often from sheer weight of crop hanging upon the grass verge below. From these trees I have just gathered 25 lb. of well ripened fruit; the circumference of their boles is 10 inches, a gravel-walk adjoins the wall and rests upon their roots. My pruning practice has been to lay in all short young shoots, shear back the facing so as to form fruiting spurs, and against the centre of each tree I have thrown an arch from the wall over the walk whereon strong shoots are permitted to grow, which are laden with flowers at one time, and with fruit at another. By contrast with the miserable attempts made at dwarf fruit-tree culture in suburban and other gardens, I maintain Morello Cherry trees stand prominently useful, and worthy the attention of all having low parting fences between limited gardens. Whilst upon this subject, I may add, that horses appear to do little or no injury to Cherry trees growing totally unprotected in orchards, wherein they are constantly turned loose. The wall and archway-grown Morellos I have before referred to are a boundary to my grass-laid orchard, there being no protection given them whatever; besides which I have other standard Cherry trees, including the Morello, whose numerous branches, densely laden with fruit, sweep downwards towards the grass, yet are never interfered with, though occasionally my two last ponies would nibble at the lower branches of the Apple trees, and occasionally rub the lower fruit off whilst grazing beneath the trees. *William Early.*

ENGLISH AND FOREIGN PLUMS.—British fruit growers for market not only seem destitute of resource, such as is necessary to checkmate the success of early sales by foreign co-growers, whereby they may be better enabled to hold their own in the home markets, but also so wedded to old stereotyped practices, they appear incapable of taking advantage of facts but too plainly forced upon them by the same foreign rivals. Unhappily, I could prove my case, and uphold my contention too successfully in regard to the majority, if not all, the different kinds of fruit sent to British markets by these separate and several growers. Suffice it, that I take Plums as the crop which has, hitherto, afforded foreign salesmen the most perfect means whereby to hoodwink British growers. That this is a startling statement I am willing to admit. I, nevertheless, leave it to the reader to determine whether I do not prove it. Our markets are filled with very green Greengages, packed neatly in effective boxes, and are glutted with foreign Plums annually for a month or two before an English Plum finds its way into market, so that the edge of the demand is worn off before British fruit appears. If we admit during the last fortnight the foreign Gages have become passable dessert fruit, it is as much as can be admitted, as previously they were wasted as regards all but cooking purposes. During the second week in July, foreign consignments of ordinary Plums (really very common varieties) reached our shores, and found ready markets, and were sold retail very freely at 4d. per lb. Now these examples were really as hard as bullets, being little if any more advanced than were home crops at the same date; since which our native Plums have been rapidly advancing to maturity; yet, strange as it may appear, the last market reports up to the time I write make no note of the receipt of home-grown consignments. Has the British Plum-grower yet to learn that green Plums—aye, green as the home crops were a fortnight ago—make the best of puddings and pies—that, in fact, for all culinary purposes, they are as good, or superior at such green stage than subsequently, when the foreigner has mulched our markets with inferior hedgerow samples, and carried off another year's harvest. Why do British growers let such crops hang until they are ripe, the trees thoroughly exhausted, and the finest varieties, with best-grown fruits in the world have to go begging for customers at unremunerative prices? to say nothing of the destruction by crushing in transit of over-ripe fruit. Our Plum crops are so excessively heavy it would have been charitable to the trees to have commenced thinning and marketing them two or three weeks ago, to say the very least. Even should these facts fail to rouse growers, is it too late for them to take lessons from, at least, their superiors in strategy—continental consignees? *William Early, August 6.*

WHAT IS A SEEDLING PLANT?—Referring to your article on this subject, and looking at the question from a florist's point of view, it is, so far as my observation goes, customary with us, in Scotland, to speak of new varieties of florist's flowers as "seedlings" until they are catalogued and offered for sale. The variety, say it is a Pansy, may be one, two, or three years old before being sent out, and, during that time, it may receive certificates as a seedling; but, as soon as it is sent out, no more honours of that description are awarded to it. Perhaps some of your readers may be able to suggest a better definition of the term seedling; yet, I think the above is capable of practical application without much friction. *M. C., Rothsay, N.B.*

FORCING LILUM CANDIDUM.—Where white flowers are in great demand in the early part of the year, few plants for forcing better repay the trouble incurred than this old favourite. If it is desirable to force them regularly, it is best to have two sets of bulbs, forcing each set alternate years. I find that the same bulbs do not give such good results if forced annually. The best time to commence is as soon as the stems of those planted out begin to decay. Take the bulbs up carefully, shake all the soil from the roots, select the largest, and remove any small bulbs that may be attached to them. The pots for growing them in should not be less than 9 inches; plant in good turfy loam, with one-third part well-decayed manure, or spent Mushroom bed, a liberal amount of sand being added. Pot firmly, placing the bulb 1 inch beneath the surface, watering well to settle the soil about them. They may then be plunged in coal-ashes, or in the ground, until required for forcing. If it is desirable to get them in flower by Easter, a commencement

should be made early in November, by placing them in a house or frame with a slight warmth, giving them a good watering if at all dry; let them remain until showing signs of growth, hard forcing in the early stages not being conducive to strong growth and fine heads of bloom. When growth has fairly commenced, a light position in an early vinery is a good place for them, the increasing heat of which suits them admirably, and they may receive supplies of weak manure-water at each alternate watering, increasing in strength as the flower stems advance, and supporting them with sticks. By the end of February they will be showing buds; a sharp look-out being kept for green-fly, which will effect a lodgment among the young buds, and quickly spoil the prospects of flowers. Dust with tobacco-powder. They will now require large supplies of water. As soon as the flowers begin to expand, place them in the conservatory or greenhouse. It is best to remove the anthers as the flowers open, because the yellow pollen soon spoils their appearance. After flowering they may be hardened off in a cold frame, or warm corner, finally planting them out-of-doors. *W. H. Stephens, The Gardens, Prescott House, Stourbridge.*

MELONS.—I only grow four kinds, which I think are first-class to keep up a succession through the season. All had the same treatment, the seeds being sown the same day—February 16, 1891. High Cross Hybrid ripened eighteen days earlier than the other three kinds, and I think it the best and earliest Melon that is grown for first crop. I have grown it for five or six years. It is a round netted fruit, with fine green flesh, good flavour, and free setter. The next to ripen was Sion House, oblong, a netted yellow skin, and scarlet flesh—a first-rate Melon. The Countess was ready a few days later. The fruit of this variety is beautifully netted, the flesh white, a free setter, and good Melon. Monarch, the latest of the four, keeps a long time in good condition after it is cut. It is a netted oval fruit, green flesh, exquisite flavour, and free setter. All the above Melons were grown in 10-inch pots in good turfy loam, with a small quantity of fresh horse-droppings, potted very freely, then plunged in a bed of leaves. *W. Smythe, The Gardens, Basing Park.*

POTATOS IN LANCASHIRE.—Both early and late Potatoes were cut to the ground by the frosts of May 16 and 17, when 13° was registered on the last date. Growth recommenced quickly, and excellent crops of early Ashleaf have been dug, very clear, and free from disease. A patch of Snowflake has been lifted to-day (August 10), of good-sized tubers, and not a diseased one to be seen. Late kinds look healthy, and promise well. *Wm. Fox, Holker Gardens.*

THE POTATO CROP.—If we get no unusual attack of the disease, there will be this year an enormous crop of Potatoes. That qualifying "if" may seem a large one after some previous years' experience, but, generally, I do not think it is in any degree large this year. How rarely has it been the case that we have had such healthy leafage on the Potato plant on the 8th of August as we see this year! A day or two since I looked over the Potatoes at Chiswick. Remembering the stormy nature of the weather we have recently passed through, and how in past years such weather would have generated the disease rapidly, I could not but think that, for the time of year, the crop there never looked better, even the very earliest varieties showing freshness and vigour of an unusual kind. Only in one place, evidently where one of the recent heavy storms had led to a temporary flooding of the row, was there any evidence of decay in the plants. Of course we may yet have the disease badly, because there is ample time, but all recent experience has shown that, be the attack ever so virulent, only a very small proportion of the tubers are now affected, so that comparatively little harm is done to the general crop. With the weather keeping finer and warmer the tuber development now made every week is wonderful, indeed August is the great month for tuber making, and every day both helps to increase the tuber bulk and minimise the effects of the disease should it appear. Sulphate of copper is being employed at Chiswick to prevent disease attacks, if possible. In one of the Tomato-houses, disease is very evident in the plants, but dressings of this assumed fungicide fail to check or cure it; that does not look hopeful for the Potato crop, especially that every shower and storm must wash the plants clean of the powder. But the question which naturally arises in relation to the non-appearance of the Potato disease so far is, does it come from the

exceeding severity of last winter, which helped to destroy the spores, or is it failing to find in the weather those atmospheric conditions which usually favour its development? So far as prices are concerned, Potatoes are plentiful already at £1 per ton. Some growers think that better prices will rule later, because the corn harvest may be but a moderate one, and the foreign crop is less than usual. So far as present appearances go, the home corn crop will not be a moderate, but rather a plentiful one, only late in being harvested. Even if we have some shortcomings, it seems evident that these will be more than neutralised by the abundant Potato crop, so that our main articles of food seem certain to be both plentiful and cheap this season. On the whole, the food outlook is an excellent one. A. D.

SEXUALITY OF ACERS.—In the *Gardeners' Chronicle* for July 4, 1891, p. 11, you illustrate male and hermaphrodite *Acer Vilmorini*. Judging by our Maples, you will not find the flowers functionally hermaphrodite. The stamens never mature in the fertile flower. The anthers are pollenless and functionless, and do not thicken it worth while to produce a filament. This is our experience, and it looks like it there. The plant is monoecious, not polygamous. *Thos. Meehan*.

THE COPYRIGHT VALUES OF SOME GARDENING BOOKS.—It is not often that the public have opportunities of judging the copyright values of well-known gardening books. The bankruptcy of the old-established firm of Groombridge & Sons, resulting in a general "selling-up" at Puttick & Simpson's, on Tuesday, has resulted in one of these opportunities, and readers of the *Gardeners' Chronicle* will be especially interested in the under-mentioned prices. The results will, at first sight, appear insignificant, especially when it is remembered that these books have run into many and large editions; but it is precisely this fact which had a very appreciable influence in gauging the prices. They are not necessarily behindhand in their information, or antiquated in their ideas. But gardening is essentially a progressive science, and the general public hesitates to buy a book unless it has the imprint of to-day upon it—but it must be candidly admitted that the preference is not at all uniformly wise. In the case of the numerous books of the late Shirley Hibberd, it will be generally admitted that there is, to use a colloquialism, "plenty of life in them yet." They are charmingly written, for Shirley Hibberd's style and manner of imparting information on the most recondite subjects had a brilliancy and perspicacity entirely peculiar to himself. To come, however, to the books themselves: Fifteen were catalogued under Shirley Hibberd's name, and the one most highly appraised was *The Amateur's Rose Book*, the copyright of which (with stereo plates and wood blocks) sold for £22; at which sum *The Amateur's Flower Garden* was also disposed of, but the latter lot included also about 500 copies "in quires." The copyright of *The Amateur's Greenhouse* (with stereo plates and blocks) went for £20; and *The Amateur's Kitchen Garden* (including 1666 coloured plates), for £15. All these are nominally 6s. books, the last one being illustrated, as will be inferred, in colours. The copyright of *Brambles and Bay Leaves* (with eight wood blocks) went for 20s.; whilst *Garden Favourites* did not secure a bid. Better, but only comparatively so, was *The Fern Garden*, which went for £9, the purchaser securing not only the copyright, 151 plates, 8 colour blocks, and twenty wood-blocks, but about 1000 copies in quires, and an assortment of 250 coloured plates; *Field Flowers*, with all the stereo plates, colour blocks, 200 copies in quires, and 2950 various coloured plates, realised £10, at which sum was also sold the *Rustic Adornments for Homes of Taste*, and a large number of coloured plates. The copyright and wood-blocks of the *Book of the Aquarium and Water Cabinet* fetched £8; the same of *Profitable Gardening*, £8 10s.; the copyright, blocks, and 590 coloured plates of *The Ivy* sold for £4 10s.; of the *Sea-weed Collector*, £7; of the *Town Garden*, £1; and of the *Greenhouse and Garden Frame*, £6 15s. Besides gardening books by Shirley Hibberd, there were two 1s. pamphlets by Mr. J. Cuthill, one on *Market Gardening*, £2, and a *Manual on the Cultivation of the Mushroom*, &c., £3 5s.; these prices including not only copyright, but blocks, plates, and much more than a sufficient number of printed copies to cover the outlay. The copyright and so forth, with 2171 numbers and 400 double numbers, and over 1000 coloured plates of *Greenhouse Favourites*, sold for £17; the copyright, &c., with fifty copies in quires of the Rev. J. S. Henslow's *Dictionary of Botanical*

Terms, went for £6, which was 20s. more than was given for J. R. Mollison's *Window Gardener* (with 300 copies in quires); H. J. Slack's *Marvels of Pond Life*, copyright, blocks, 200 copies in quires, and 2300 coloured plates, sold for £10; and Sara Wood's *The Dwellers in our Gardens*, £8 10s. *W. Roberts*.

NOVELTIES.

The tacks, of which we give an illustration, are of steel, well and uniformly made, sharply pointed, and,

FIG. 26.—GROOVED TACKS.

owing to their grooved sides, they "hold well." They may be had from Messrs. Nettlefold & Sons, 54, High Holborn.

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 11.—The ordinarily gloomy-looking Drill Hall was lighted up on this occasion with a large and miscellaneous assemblage of plants, exhibited for the judgment of the several committees and for the admiration of the visitors. The chief things exhibited were the Carnations, of which we give a special note, a few Orchids and herbaceous plants, and a fine collection of Peaches, Apples, Gooseberries, Plums, &c., which are duly noted in the following columns. The Floral, Orchid, and Fruit Committees had plenty of work before them, the last-named making an endeavour to settle the knotty points connected with the selection of the best varieties to recommend for cultivation in various districts for cottagers and small growers. As the committee consists principally of trade growers and professional gardeners, with a few amateurs, it was evidently difficult for them to realise adequately the requirements of cottagers. The assistance in various counties of the local clergy interested in horticulture might be invoked with benefit. The Scientific Committee failed to furnish a "quorum," and no meeting was in consequence held.

Mr. Hudson gave an excellent lecture on "Stove Plants" at the 3 o'clock meeting, but for the majority of people its excellence will have to be taken for granted till they see it in print. The acoustic properties of the hall are bad enough in all conscience, and it does not make matters any better to place the audience under the gallery where the speaker ought to be, and *vice versa*: neither does it facilitate the comfort of the reader, nor help his auditors, to deprive the reader of a reading-desk. Under present circumstances the best place to hear would probably be under the table, supposing the non-conducting cloth were removed. But as such a position would hardly be decorous, we trust that speakers who wish it, may be provided with a desk whereon to lay their manuscript. This would serve as a useful reminder to the speaker to lift up his head, while he would not be compelled to address his remarks to the table. In the course of his observations, Mr. Hudson commented on the improvements manifest during the last quarter of a century, and dealt with many of the leading decorative plants such as Palms, Crotons, Dipladenias, and many others. In connection with this subject, he mentioned the history of *D. Brearleyana*, raised by a mechanic and eventually purchased for £150 by a London nurseryman. Mr. Bunyard, Mr. Wythes, and the chairman, Mr. Douglas, contributed to the discussion.

An effective group of *Campanula pyramidalis*, white and blue, and *C. p. compacta*, surrounded by

C. carpatica, was exhibited by Mr. G. Wythes, gr. to the Duke of Northumberland, Syon House. The plants were in 7-inch pots, and full of flower; this gained a Silver Banksian Medal. Mr. Wythes also showed three large white flowers of *Cereus hexagonus*.

A Silver Banksian Medal was awarded to Mr. C. F. Bause, Morland Nursery, South Norwood, S.E., for a beautiful group of *Caladiums*, two new ones gaining First-class Certificates, viz., *Louis Van Houtte*, a rich bronze-crimson, and *M. Léon Say*, metallic-crimson; the varieties *Duchesse de Montemart*, cream with green veins; *Raymond Lemoine*, crimson-cream and cream border; and *Madame Imbert Koechlin*, yellow with crimson spots, were conspicuous.

Messrs. Pitcher & Manda, United States Nursery, Hextable, had a double white *Achillea*, *The Pearl*, which will be useful for wreaths.

A silver-gilt Flora Medal was awarded to Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, for a collection of well-coloured *Crotons* and dwarf Ferns, *Sunset*, *Magnificent*, *Bergmanni*, and *Comte de Germiny* were some of the best *Crotons*. Mr. May also showed a basket of *Bouvardia Purity*, which has already been certificated, the flowers are waxy-white, large, and stand erect and compact. A clear pink *Bouvardia*, *Mrs. Robert Green*, was also in this exhibit.

Messrs. James Veitch & Son, Chelsea, obtained a silver Banksian Medal for a collection of plants for table decoration, which consisted of small Palms, *Azaleas*, *Sarracenia*, *Nepenthes*, *Yucca filamentosa variegata*, *Y. f. aurea variegata*, Ferns in variety, &c.

Orchid Committee.

Present: Mr. James O'Brien in the chair; Messrs. H. M. Pollett, H. Ballantine, E. Hill, H. Williams, Jas. Douglas, A. H. Smee, Lewis Castle, and Dr. M. T. Masters, F.R.S.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited two hybrid *Cypripediums* in *Cypripedium Corningianum* × (*C. superbiens*, seed-bearer, and *C. Philippinense*, whose features somewhat resemble those of the favourite *C. Morganæ* ×, but with long and densely spotted petals; and *C. macrochilum* × (*C. longifolium*, seed-bearer, and *C. (mopedium) Lindenii*, male). The result has been very extraordinary in several ways, and notably in the crossing with a species in which the lip is very rudimentary, resulting in the lip in the progeny being almost twice the length of the seed bearing one—the only one of the two which can be said to have a pouch or lip. The plant, which had the usual bright green leaves of the *Selenipedium* section, had a four-flowered scape equal in size to those of *C. caudatum*, and much the same in colour as *C. caudatum Wallisii*. The petals are after the manner of *C. caudatum*, but as seen in the young specimen exhibited, not so long. The peculiar feature is the long and beautifully-marked labellum. Messrs. Veitch also exhibited their *C. Cleoine* ×, whose flowers were something like those of *C. Sedeni caudulum*, but smaller.

Thomas Statter, Esq., Stand Hall, Whitefield, Manchester (gr. Mr. R. Johnson), exhibited *Dendrobium Statterianum* (not to be confounded with *D. Phalenopsis Statterianum*), a supposed hybrid probably between *D. crystallinum* and *D. Bensoniæ*. The flowers were something like, but richer in colour than those of *D. crystallinum*, and the rich yellow of the lip seemed to tell of *D. Bensoniæ*. The absence of nodes on the pseudobulbs prevented its being considered a form of *D. Boxallii* (a reputed cross between *D. crystallinum* and *D. crassinode*). *D. Statterianum* is a pretty and showy variety, and is stated to last in flower for nearly two months. Mr. Statter also exhibited a grand form of *Bollea celestis*, *Phajus Humboldtii rubescens*, a fine spike of *Lælia elegans Turnerii*, and a spike of a good variety of *Cattleya velutina*.

C. J. Lucas, Esq., Warnham Court, Horsham, sent a well-grown plant of *Angraecum Ellisii*, with twenty-one flowers; a plant in flower of *Thrixpernum Berkeleyi*, and a cut spike of *Ceologyne pandurata*.

F. Wigan, Esq., Clare Lawn, East Sheen (gr. Mr. W. H. Young), showed a plant of *Lycaste tetragona*, and one of *Dendrobium longicornu*.

Messrs. Seeger & Tropp, 112, Lordship Lane, East Dulwich, exhibited *Cattleya Gaskelliana* var. *speciosa*, a variety with well-formed flowers. Sepals and petals pure white, lip edged with white, and having a bright purplish-crimson blotch, with yellow at the base.

Messrs. Charlesworth, Shuttleworth & Co., of Park Road, Clapham, and Heaton, Bradford, showed

the curious little brown-and-yellow *Odontoglossum Hennisii*, described in the *Gardeners' Chronicle*, Aug. 8, p. 158. F. M. Barton, Esq., Highfield, Gainsborough, sent a hybrid *Cypripedium* (supposed parentage *C. barbatum* and *C. venustum* var.), but exhibiting very little change from one of the poorer forms of *C. barbatum*; and from the gardens of His Grace the Duke of Devonshire, Mr. Owen Thomas came other examples of his fine culture of *Disa grandiflora*, to which a medal was awarded at the last meeting. The flowers were very large and fine in colour, one spike bearing eleven flowers. A special vote of thanks was passed with regard to this exhibit.

Fruit Committee.

Messrs. J. Veitch & Sons, Chelsea, sent seventy-nine dishes of ripe Gooseberries, some of the best being Warrington, Laccashire Lad, Ironmonger, Highlander, Pretty Boy, and Keen's Seedling. There were twenty-four dishes of early Apples, the best being Mr. Gladstone, Red Astrachan, and Lord Grosvenor; four dishes of Cherries, four of Pears, including excellent Citron des Carmes; also seven dishes of red, white, and black Currants. The collection was given a vote of thanks, though a Silver Medal would have been unanimously awarded, had not this been given at the last meeting for a collection of Gooseberries.

Two nice boxes of Cucumbers, named Matchless, from Mr. S. Mortimer, Swiss Nursery, Farnham, were awarded a First-class Certificate; they were of a good colour, with scarcely any neck, and not too large, with very few spines; this should make an excellent exhibition Cucumber.

A Bronze Banksian was awarded to E. M. Nelson, Esq., Hanger Hill, Ealing, for twenty-two dishes of Gooseberries and one dish of Early Prolific Plums, the best of the Gooseberries being Smiling Beauty and Lady Leicester. A Cultural Commendation was also awarded to a fine dish of Humboldt Nectarines, from the same exhibitor. Mr. Chadwick, the gardener at Hanger Hill, grew the Plums on walls.

A nice dish of an early yellow Plum, named St. Etienne, was contributed from the Society's Gardens, Chiswick, and received an Award of Merit; this Plum should make a good companion to Early Rivers.

Messrs. Burton & Sons, The Peacheries, Bexley, sent eight large boxes of Peaches and Nectarines, containing about 250 fruits of great excellence, some having been grown on standards. The Peaches were Dymond, Sea Eagle, Royal George, and Alexander Noblesse. The Nectarines shown were Elruge, Pine-apple, and Humboldt, the two latter of a splendid colour, this collection being awarded a Silver Banksian Medal.

Mr. C. Ross, Welford Park, Newbury, sent a large Melon, named Meritorious, of good shape, and with a thick scarlet flesh and pale green lining near the outside, it was good flavoured, considering the small quantity of sunshine of late; this received an Award of Merit. Melons were also sent from Syon House, and Mr. Cannell sent a new one named Eynsford Gem, but it was past it best.

Grapes were sent from Mr. Maher, Yattendon Court, Newbury, a new seedling, being a cross between Hamburg and Alicante, but not in good condition as to colour or ripeness. A bunch of Hamburg was also sent for comparison.

New Peas were sent called Leeton's Excelsior, a cross between Duke of Albany and Veitch's Autocrat, but these were too far past their best for favourable comparison. H. Balderson, Esq., Comos Hall, Hemel Hempstead, sent a new Pea, a cross between Veitch's Perfection and Ne Plus Ultra, an improvement in size of pod and Peas, with the deep green colour of the latter, with good flavour. This the committee desired to be sent to Chiswick for treatment as to its cropping qualities.

The Carnation Show.

The Supplementary Carnation Show, which the prize given by Martin R. Smith, Esq., for Border Carnations occasioned, was much more extensive than was to be expected from the lateness of the season, all classes of the Carnation being well represented. The conditions under which the flowers were shown appeared in full last week; so far as could be perceived these conditions were observed, and Mr. Smith must be congratulated upon the success of his experiment.

In the class for the best border variety of self-coloured Carnation, not fewer than twelve trusses, the 1st prize was awarded to Mr. W. H. Divers, The Gardens, Ketton Hall, Stamford, for Ketton Rose, bright rosy-pink, with good shell-shaped petals, a little inclined to cup, not without the suspicion of a

tendency to burst its calyx; 2nd, Mr. C. Blick, gr. to M. R. Smith, Esq., The Warren, Hayes Common, Kent, with Alice Newman, a large, dull deep scarlet flower, apparently a very strong grower, of fairly dwarf habit; 3rd, Mr. A. Searing, The Gardens, Oak Lodge, Sevenoaks, with an unnamed white Self, with a slight tinge of sulphur in the centre, apparently also a little inclined to split its calyx. Other flowers exhibited in this class were Gloire de Nancy, white; and Mrs. Reynolds Hole, from Mr. E. C. Goble, Walcot nursery, Ryde, Isle of Wight, both with split pods; Carolus, a pale form of Mrs. Reynolds Hole, of a soft salmon colour, but not perfect in the calyx; and Cotin, dull orange crimson, a strong grower, large and rough as shown, from Mr. A. Herrington, The Gardens, Shrubland Park, Needham Market.

Mr. G. H. Sage, The Gardens, Ham House, Richmond, exhibited a pleasing pink self, a strong grower, but a little rough. Mr. John Walker, nurseryman, Thame, had a deep pink self, flushed in the centre with bright rose, also of vigorous growth. Mr. Shoesmith, gr. to Mrs. Hodgson, Shirley Cottage, Croydon, showed a deep pink self, flushed with pale rose, the flowers somewhat coarse. Mr. J. Douglas, gr. to Mrs. Whitbourn, Great Gearies, Ilford, had a soft pink self, delicate in colour, good petal, and a strong grower. From Mr. William Robinson, Gravetye Manor, East Grinstead, came Gravetye Rose, bright rose, the petals inclined to cup, even in what appeared to be young flowers.

The class for twelve self-coloured border Carnations, not less than six trusses of each variety, brought a very fine collection from Mr. C. Blick, showing varied colours, good quality of bloom and sturdy growth, which was awarded the 1st prize. It consisted of Clovis, bright crimson, fine in petal; Lady Gwendoline, deep rosy-scarlet; Etna, bright scarlet; Mrs. Muir, white; Dr. Hodd, bright purple; Iona, sulphur; Dainty Dick, soft pink; Maroon, bright crimson shaded with maroon; Roma, bright rose; Marion, maroon-crimson; Louisa Jameson, rosy-scarlet, very fine; Albatross, pure white, small, good petal; and Mary Morris, pink. The foregoing showed the effects of the weather less than any other collection, and was characterised by better quality of bloom throughout. Mr. A. Herrington came 2nd, having Ovid, pink; Sport, of a port wine colour; Comtesse de Paris, blush; M. Janssen, maroon; Carolus; Jean Armstrong, deep pink; Madame de Lafausse, white with sulphur centre; Merchant of Venice, rosy-scarlet; and Colin. The 3rd prize was awarded to Mr. John Walker, nurseryman, Thame, who had unnamed seedlings of various colours, generally small and compact in flower.

Mr. C. Blick also gained the 1st prize in the class for eighteen varieties of flake, bizarre, or fancy Carnations, staging a fine lot of flowers, including Sir Beauchamp Seymour, yellow, flaked with salmon crimson; Lady Hermione, a rose-edged Picotee, much barred; Lucretia, blush, flaked with purple maroon; Phoebe, crimson bizarre; Lady Grimston, white, having a very light edge of rose; Sir Granville Egerton, scarlet flake, with slight lines of maroon; Miss Constance Graham, scarlet flake, very fine; Alice Ayres, white, with slight flakes of red; Mrs. Faouy Fane, crimson bizarre; Oreg, a purple-edged Picotee; May Queen, rose flake; Archie Dougall, a heavy red-edged Picotee; and some unnamed seedlings. The second prize went to Mr. J. Douglas, with an unnamed collection of bizarre and flaked Carnations with Picotees.

Other contributions of Carnations helped to make up one of the most interesting displays of this popular flower ever before seen at a meeting of the Royal Horticultural Society. Mr. C. Turner sent from his collection at Slough, a number of grand plants in pots, of named varieties; boxes of cut blooms of border varieties, and stands of exhibition blooms; a highly meritorious contribution. There were six plants of Romulus, yellow ground, heavily flaked with deep rose and flushed with mauve (Award of Merit); four plants of King of Scarlets, brilliant scarlet, large, and very handsome (Award of Merit); six plants of Lord Randlesham, yellow ground, suffused pale red and flaked with dull slaty-purple; six plants of Victory, yellow ground, heavily flaked with pale scarlet and flushed with crimson (Award of Merit); six plants of Ruby, very rich bright ruby-rose, extra fine (Award of Merit); twelve plants and two boxes of cut-blooms of Queen of Bedders, deep dull scarlet, dwarf erect growth, very fine in the flower and remarkably strong grower (Award of Merit); and three blooms each of Rose Wynne, bright maroon self; Salamander, a salmon-pink self; Rose Unique,

very soft deep pink, extra fine; Lady Walker, buff-yellow; Golden Fleece, pale yellow; Duchess of Sutherland, heavy rose edge Picotee; Mrs. Harford, medium rose-edge, fine in petal; Lady Emily Van de Weyer, light rose edge Picotee; Purity, light red edge Picotee, a large flower of fine quality, massive in petal; Edith M. Wynne, yellow ground edged with maroon and crimson and slight stripes of scarlet (Award of Merit); Countess of Jersey, bright yellow, edged with rose—very fine (Award of Merit); Madeline, a beautiful light rose-edged Picotee (Award of Merit); Mrs. Walford, yellow ground, with slight lines of rosy-purple at the points of the petals (Award of Merit); Old Coin, yellow, delicately flaked with salmon and crimson; and Lady Mary Currie, rose flake—a fine variety, but with too much colour on the petals. Mr. J. Douglas staged two of his fine new yellow grounds, viz., Mrs. R. Sydenham, pale yellow, edged with rose—a beautiful flower of fine quality (Award of Merit); and Lily Henwood, heavily edged and flaked with bright purplish rose—very fine.

From the Society's garden at Chiswick came a very interesting collection, consisting of The Moor, deep bright crimson; Guiding Star, scarlet; Fireball, bright crimson; Theodore, heliotrope colour, highly fragrant, distinct, and novel; Chiswick Red, very bright; C. J. R. Allinson, deep pink; Dante, scarlet-flake; Madame Van Houthe, yellow ground; Sam Toplis, scarlet-flake; Alida, a very fine fleshy pink self; Mrs. Reynolds Hole, Van Dyck, rose-flaked with slaty-blue; Caractacus, crimson-bizarre; Romeo, purple-edged Picotee; J. B. Bryant, red-edged Picotee; Redbraes, purple-edged; Brockhans, yellow ground, heavily flaked with slate; Snowdrift, white; Caledonia, purple; and Edith, pale ground, flaked with scarlet.

Mr. E. C. Goble staged twelve bunches of Carnations, including Lady Sutton, a bright buff self; Boulanger, deep bright scarlet; Mrs. Frank Watts, white; Germania, Mrs. Reynolds Hole; Rosy Morn, deep bright rose; James Bennett, yellow ground, edged rosy-purple; Alice Ayres, &c.

Mr. Martin Rowan, Manor Street, Clapham, sent six boxes of town-grown Carnations and Picotees, showing how well they can be cultivated within easy distance of the City. The collection was awarded a Silver Flora Medal.

From Mr. F. Bull, florist, Wormingham, Colchester, came twelve blooms of a very bright yellow ground, a seedling from Pride of Penhurst. Messrs. James Veitch & Sons, Exotic Nurseries, Chelsea, had four large boxes of cut blooms, including some very fine selfs, such as Germania, Florence, John Barnet, deep purple; Rose Celestial, rose; The Bride Brilliant, bright scarlet; Dr. Parke, deep pink; Raby Castle and Charles I., yellow ground, heavily edged and flaked pale rose; Lothair, delicate pink; Mrs. Combie, yellow, flaked with rose; and William Toby, maroon self.

Other florists' flowers comprised superb lemon and orange African and striped French Marigolds from Messrs. Dobbie & Co., Rothesay; also selected garden Marigolds, Violas, in bunches, and fine fancy Pansies from the same. From Messrs. Paul & Son, Cheshunt, came a collection of hardy flowers, Cheshunt Scarlet Bedder Rose, shaded scarlet; Tea, Kaiserin Frederick, a very pretty pale variety; H.P.'s, T. B. Haywood, deep crimson; Charles Gater, bright crimson, fine and full (Award of Merit); Dowager Duchess of Marlborough, pale rose; and Bruce Findlay, bright shaded-crimson. Messrs. J. Peed & Son, Rorpell Park Nurseries, Streatham, had a large collection of blooms of handsome Gloxinias. Messrs. Hurst & Son, seed merchants, 152, Houndsditch, sent some double varieties of Chrysanthemum carinatum. Mr. Arthur Rawlings, Florist, Romford, had a stand of new Dahlias, among them, Mrs. McIntosh, deep yellow, with cerise reverse, a very promising flower, which the Floral Committee desired to see again; George Hurst, bright crimson-scarlet; and Mrs. Ocock, yellow, tipped with pale brownish-red and mauve; and a stand of twelve excellent show Dahlias. Messrs. Henry Cannell & Sons, nurserymen, Swanley, had a collection of Cactus and decorative Dahlias, including Oban, salmon, flushed with mauve, which the committee wished to see again; Wm. Pearce, yellow; Beauty of Arundel, bright crimson and purple; Panthea, Duke of Clarence, Black Prince, Sydney Hollings, &c.

ORCHID COMMITTEE AWARDS.

First-class Certificate

To *Cypripedium Corningianum*, from Messrs. James Veitch & Son.
To *Cypripedium macrochilum*, from Messrs. James Veitch & Son.

Awards of Merit.

To Dendrobium Statterianum, from Thos. Statter, Esq.
To Cattleya Gaskelliana speciosa, from Messrs. Seeger & Tropp.

Botanical Certificate.

To Odontoglossum Heaninii, from Messrs. Charlesworth, Shuttleworth & Co.

Cultural Commendation.

To Angraecum Ellisii, from C. J. Lucas, Esq.

Special Vote of Thanks.

To Mr. O. Thomas, for group of Disa uniflora (grandiflora).

FLORAL COMMITTEE.

Awards of Merit.

To Carnation Pride of Sevenoaks, from Mr. W. A. Searing.
To Carnation Ketton Rose, from Mr. W. H. Dovers.
To Carnation Mrs. R. Sydenham, from Mr. J. Douglas.
To Caladium M. Leon Say, from Mr. F. Bause.
To Caladium Louis A. Van Houette, from Mr. F. Bause.
To Rose Charles Gater, from Messrs. Paul & Sons.
To Carnations Romulus, King of Scarlets, Victory, Ruby, Queen of Bidders, Edith M. Wynne, Countess of Jersey, Mrs. Walford, Madeline, from Mr. C. Turner.

MEDALS.

Silver gilt Flora.

To H. B. May, for group of foliage plants.

Silver gilt Banksian.

To J. Veitch & Sons, for group of foliage plants.
To F. Bause, for group of Caladiums.

Silver Flora.

To Mr. Rowan, for group of Picotees.

Silver Banksian.

To Mr. G. Wythes, for group of Campanulas.
To C. Turner, for group of Carnations.
To Messrs. Dobbie & Co., for group of Violas, &c.

Bronze Banksian.

To Paul & Son, for group of herbaceous plants.

FRUIT COMMITTEE.

First-class Certificate.

To Cucumber Matchless, from Mr. A. Mortimer, Swiss Nursery, Rowledge.

Awards of Merit.

To Seedling Melon Meritorious, from Mr. Charles Ross, Welford Park.
To Plum St. Etienne, from the Royal Horticultural Society's Gardens.

MEDALS.

Silver Banksian.

To Thomas Burton & Sons, Bexley, for Collection of Peaches and Nectarines.

Bronze Banksian.

To E. Chadwick, gr. to E. W. Nelson, Esq., for Collection of Fruit.

ST. NEOTS HORTICULTURAL.

The twenty-seventh exhibition of this Society took place in Priory Park on August 3, and was in all respects a good one for the district. St. Neots being in the centre of a great market gardening community, prizes are offered for farm and market garden produce. A few classes for cut flowers are open to all comers. In the class for twenty-four Roses, E. B. Lindsell, Esq., Hitchin, who has been very successful this season, was 1st, with a very fine lot of blooms.

In the class for twenty-four bunches of flowers, Messrs. Wood & Hunt, Girtford, were 1st, with some very fine hardy herbaceous flowers, making an imposing display. Messrs. Wood & Hunt were also 1st with twelve bunches of hardy herbaceous flowers, staging another fine lot.

In the member's class for twelve cut Roses, Mr. Lindsell was again 1st, with good blooms. Mr. Lindsell was also 1st with twelve blooms of tea-scented varieties. Other cut-flowers included fine Stocks, charming bunches of hardy flowers and half-hardy annuals, Zinnias, Phloxes, &c.

In the plant classes, Mr. Redman carried off most of the 1st prizes. In the class for four tuberous-rooted Begonias, Mr. R. J. Towgood, St. Neots, was 1st; tricolor zonal Pelargoniums are well grown at St. Neots, and it is stated that they are becoming much more popular.

Fruit was somewhat sparingly shown; but vegetables were a great feature.

ATHERSTONE HORTICULTURAL.

MONDAY, August 3.—The annual exhibition of the above Society was held in the Merevale Park. The show itself was one of the best the Society has ever held; the number of entries exceeded that in former years, and the quality of the exhibits was marvellously good considering the season. Especially was this the case in the cottagers' classes, in which there is generally fierce competition. In the open classes some grand exhibits were to be seen. The large collections arranged for conservatory effect were again a centre of attraction. The 1st prize of £3 and a silver medal was won

by Mr. R. Allum, of Tamworth. There was a number of very choice stove and greenhouse plants, the principal prize-takers being Mr. Allum, Mr. H. Townshend, Mrs. Dugdale, Mr. Alderman Kenrick, Mr. R. Stafford, Mr. H. Cunliffe Shaw, Canon Thornton, Mr. G. Moore, &c. In the classes for cut flowers, there were some beautiful Roses shown by Messrs. Perkins Brothers, of Coventry; and Mr. Woodford and Mr. Durno, of Atherstone; and many of the other exhibits in this tent were exquisite specimens of floriculture. The fruit was particularly fine and good. The amateur division was well represented, and brought together some remarkably good stuff, worthy in many cases of better prizes.

THE CARNATION AND PICOTEE UNION, OXFORD.

TUESDAY, August 4.—The annual exhibition was held in Mr. Dodwell's garden in the Stanley Road. There was a large display of flowers in the competition classes, and many of the blooms were of fine quality. It was a field day for the southerners, for no flowers were forthcoming from Lancashire, Yorkshire, or the north, for the simple reason that the plants were not in bloom, the long spell of damp, cold, and sunless weather being the cause. The Midland growers were also *hors de combat* from the same cause.

In the class for twelve Carnations, Mr. Read and Mr. M. Rowan were placed equal 1st; and for twelve Picotees, 1st, Mr. Read. For six Carnations, 1st, Mr. J. Kean; and for six Picotees, 1st, Messrs. Thomson & Co. For twelve self and yellow grounds—1st, Mr. M. Rowan; and for six self and yellow grounds—1st, Mr. Nutt.

For six of the Kilcurry yellow-ground flowers—1st, Mr. Read; and for six yellow-ground varieties—1st, Mr. Read. In all these classes from five to seven other prizes were awarded. There were a large number of blooms staged in the single classes, many of them of considerable merit, and all the prizes were awarded.

The premier blooms were—Carnation George Melville, P.F., in Messrs. Rowan's stand of twelve; Picotee Mrs. Payne, medium rose-edge, in Mr. Read's stand of twelve; Self Carnation Germania, in Mr. Nutt's stand of six; and Fancy Picotee Tournament in Mr. Read's stand.

Certificates were awarded to Martin R. Smith, Esq., for border Carnations; Niphetos, white; Mrs. Louisa Jameson, scarlet; Lady Gwendoline, a paler scarlet; Abigail, warm rose colour; Royal George, rosy-purple; and Athene, light purple.

Certificates also were awarded to the following new varieties staged by Mr. Charles Turner:—Dr. Hogg, bright scarlet bizarre; Charles Turner, a grand scarlet flake; Charles Henwood, a fine purple flake; and a S-lf-yellow; Lady Walker, similar in colour to Germania, and not superior to it; Ruby, a superb self, rich rosy-carmine, of fine form, is a beautiful variety, but was not certificated.

The following new Picotees of Mr. Turner also received Certificates:—Madoline, heavy rose edge—a very fine flower; Lady Emily Van de Weyer, a light rose edge, with first-class petal and form; Lord Rendlesham, deep salmon ground, suffused with bright shaded mauve, and should be amongst the Carnations noticed above; Sunset, pale salmon, with bright lilac-tinted red markings; Apollo, creamy-yellow, with faint carmine markings; Romulus, creamy-yellow ground, with rich pale carmine markings—very fine; Mrs. Henwood, a fine flower, with pale yellow ground, and pale scarlet markings.

In addition to the competitive display, Mr. Dodwell's well-grown collection of over 3000 pots of plants were in fine condition; and the number of various coloured self and fancy varieties, so suited to general decorative work, and raised by Mr. Dodwell, were objects of general admiration.

ANNUAL EXCURSION OF THE ROYAL SCOTTISH ARBORICULTURAL.

WEDNESDAY, August 5.—Over fifty members of this Society started from Edinburgh on the annual excursion at 6.55 A.M. Drumlanrig, Terregles and Kirkconnel, Dumfriesshire; Munches, Kirkcudbrightshire; and Castle Kennedy, Wigtonshire, were the principal places on the programme to be visited during the three days' excursion.

The party, on leaving Princes Street Station, included, among others, the President (Professor Bayley Balfour), Messrs. Malcolm Dunn, Jas. Kay,

Jas. Buchanan, Geo. McKinnon, J. Methven, D. Thomson, D. P. Laird, Alex. Milne, A. Kerr, T. Williamson, J. Henderson, and W. Robertson. Abington, on the upper waters of the Clyde, was the destination of the party. The number of members was increased by the time they sat down to breakfast to seventy.

From Abington the party started in vehicles for Drumlanrig, over the Lowther Hills *via* the Pow-trail Glen and the Dalveen Pass, a distance of about 24 miles. The road at first traversed a purely pastoral country, extremely bare of woodland. It would have been more profitably occupied with trees than with the sparse flocks of sheep that grazed on them. "A grand field verily for reforestation," was the general comment. All that was wanted to render the district perfect for the purpose of dairy farming was the shelter of judiciously planned plantations. Soon after passing the boundary of Lanarkshire into Dumfriesshire, the Dalveen Hills, clothed with pasture to the summit, rose into view. The sides of some of the deep gorges were lined with dense masses of *Alnus crispa*, while on the short close-cropped turf appeared wide-spread patches of dwarf Ferns.

The party was met at Carron Bridge, immediately outside the northern boundary of the Drumlanrig policies, by Mr. Fingald, head forester on the Drumlanrig estates, and by Mr. Doughty, who occupies the same position on the estates of the Duke of Buccleuch at Lougholm, and were thence conducted through the northern part of the grounds. They were here struck with the immense extent and the thriving condition of the woodlands, and the varied features of the extensive landscape opened up to view in the progress towards the Castle. In 1883 and 1884 we were informed by Mr. Fingald this portion of the grounds and others which we were unable to visit were devastated by gales, upwards of 300,000 trees having been blown down. The effects at the time must have been extremely depressing to the proprietor as well as to his chief forester, who had planted many of the fallen trees and fostered all during his fifty years of service. The gaps so made were visible only by the presence of wide groups of *Abies Alberti* and other trees of a younger race than those surrounding them which had weathered the storms. These younger trees had been planted immediately the ground was cleared of the wreck, and are now in many cases rivaling those which remain of the older plantations. There are about 11,000 acres of enclosed woods on this property.

Arriving at Drumlanrig Castle, the party was met by Mr. David Thomson, the head gardener, and had its numbers augmented by other prominent members of the Society—Mr. James Watt, Carlisle; Mr. Paton, Kilmarnock; and others having arrived by other routes. At this stage the company were hospitably entertained to lunch by the Duke of Buccleuch, for which his Grace was warmly thanked on the motion of Professor Bayley Balfour.

The remainder of the time here was occupied in noting the larger trees around the flower gardens and the Castle, some of which were among the oldest and the largest on the estate. Among those measured, the largest were—a fine Oak, which girthed 15 feet 4 inches at 5 feet from the ground; some grand Limes, the largest of which girthed 16 feet 1 inch at the same height; a Sycamore, girthed 17 feet 2 inches at the same height, with an elevation of 97 feet; a Silver Fir, 13 feet in girth, and 96 feet high; a Beech, 15 feet 7½ inches in girth, and perfect in symmetry as a park tree; two specimens of *Pinus pinaster*, 60 feet high, and within an inch of being equal in girth to the largest, being 7 feet 8 inches; a Hornbeam girthed 8 feet 2 inches, with spread of top of 74 feet; and a Douglas Fir 8 feet 2 inches girth, and 80 feet high, planted about forty years.

In the flower garden a specimen of *Cupressus Lawsoniana lutea* attracted the attention as being probably the finest in Scotland. It was 10 feet high, and perfect in shape and colour.

The party then drove *via* Thornhill, direct to Dumfries, the head-quarters of the excursion for the first night. On arriving at Dumfries, the company was further increased by the arrival of Dr. Somerville, of Darham, late Lecturer on Forestry in Edinburgh University, and by others from the locality.

The Annual Dinner of the Society took place in the Commercial Hotel at 8.30 P.M., Professor Bayley Balfour presiding, and Mr. John Methven croupier. Further particulars will be given in our next issue.

TRADE NOTICES.

THE ENGLISH FRUIT AND ROSE COMPANY (CRANSTONS).

WHEN this Company was formed, we are told that debentures to the extent of £11,000 were issued, payment of which was guaranteed by the Law Guarantee and Trust Society, which is responsible to the Debenture holders. To secure itself, the Law Guarantee Society agreed with the English Fruit and Rose Company to execute a deed enabling the Society to take possession of the Society's business in certain contingencies. Some of these contingencies have come to pass, and the result is that the Guarantee Society is now in possession of the Company's property. The Guarantee Society, we believe, intend to carry on the business; practically, therefore, there are no assets for general creditors. The Guarantee Society have, as we presume they were entitled to do, laid their hands on everything, and the ordinary creditors are not likely to get anything. Such a state of affairs should put the trade on their guard how they give credit to similar societies.

MESSRS. PETER LAWSON & CO.

At the seventh annual general meeting of the shareholders of Peter Lawson & Co. (Limited), held to-day, the Report as issued to the shareholders was adopted, and a dividend of 7 1/2 per cent. per annum was declared, carrying forward the sum of £2801 4s. 11d.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (Daily, Accumulated), RAINFALL, and BRIGHT SUN. Rows list districts 1-14 with corresponding weather data.

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending August 8, is furnished from the Meteorological Office:—

"The weather has continued in a very unseasonable condition generally. Frequent falls of rain, occasionally accompanied by thunder and lightning, have occurred in all districts, and the intervals of

clear sky have been (excepting in the extreme S.W.) very brief.

"The temperature has just equalled the mean in 'Scotland, W.', but has again been below it in all other parts of the Kingdom. In 'England, E. and S.', and in the 'Channel Islands,' the deficit has been as much as 4°. The highest of the maxima, which were registered either on the 2nd or 8th, ranged from 73° in 'England, S.', to 67° in 'England, N.W.' and the 'Channel Islands.' The lowest of the minima, which were recorded on somewhat irregular dates, varied from 36° in 'Scotland, E.', and 38° in 'England, S.W.', to 47° in 'Scotland, W.', and 49° in the 'Channel Islands.'

"The rainfall has been considerably in excess of the mean over the Kingdom generally, but in 'Ireland, N.' a slight deficit is shown.

"The bright sunshine has been less than the mean in nearly all districts, the deficit being greatest in the northern and eastern parts of England. The percentage of the possible amount of duration ranged from 54 in the 'Channel Islands,' and 43 in 'England, S.W.', to 37 in 'England, S.', 21 in 'Ireland, N.', and 19 in 'England, N.E.'"

MARKETS.

COVENT GARDEN, August 13.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal sale-men, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET well supplied, and quotations the same as last week. James Webber, Wholesale Apple Market.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various cut flowers including Asters, French, Carnations, Gladioli, Heliotrope, Lilies, etc.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots including Aralia Sieboldi, Aspidistra, Begonia, etc.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing prices for various vegetables including Artichokes, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, etc.

POTATOS.—Supplies still very heavy, and a slight show of blight amongst most samples. Buyers hold aloof, except at very low prices. Beauties, 60s. to 55s.; Roses, 60s. to 55s.; Snowdrops, 75s. to 80s.; Kidneys, 85s. to 90s. J. B. Thomas.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits including Apples, Cherries, Currants, Gooseberries, Grapes, Lemons, Melons, Peaches, etc.

NOTICES TO CORRESPONDENTS.

ANTS: B. Kent. These insects may be expelled by dusting flowers-of-sulphur about the nest; strong-smelling mineral oils may also be used. Carbolic acid diluted with ten times its bulk of water, then squirted in their haunts, will dislodge them. They may also be trapped by bones or sponge soaked in treacle, periodically visiting the traps, and dipping them in boiling-water.

CARBOLIC ACID TO VINES: In the issue for July 25 "A. W." inquires what proportion of carbolic acid to water should be used on the roots of Vines? I am now enabled to inform him that it is best to use one bushel of stone lime, one teacupful of crude carbolic acid, and enough water to slack. Apply the mixture with a brush. J. J. Willis, Harpenden.

DOUBLE FLOWER: J. H. If the flower be absolutely double, no seed can possibly be produced, but it comparatively rarely happens that the flower is in this sense perfectly double.

ERRATUM.—In our report of the Southampton Show on p. 174 of last week's issue, we stated that Mr. Rumsey, of Waltham Abbey, was 1st with 24 Rose blooms; it should have been, Mr. S. G. RUMSEY, Wrotham, Kent.

FUNGUS IN MUSHROOM BEDS: G. P. D. The fungus is too small, imperfect, and undeveloped for determination; doubtless it came from the spawn. It seems to be a little stunted form of the Mushroom, by some means arrested in growth, but so very young that there are no spores. M. C. Cooke.

GLOXINIAS: J. T. The white flower is good, and if the habit of plant is satisfactory, would be worth propagating; the others are fine, but more common.

GRAFTING: Inquirer. The Art of Grafting, by Charles Baltet, English Edition (1873), to be had of William Robinson, 37, Southampton Street, Strand, small 8vo, pp. 230, with numerous illustrations. We do not know the price; a few shillings, probably.

GRAPES: J. R. H. Your Grapes are "shanked," which condition generally arises from faulty cultivation.

GUATEMALA SEEDS: W. F. & Co. The only names we recognise are Papaya, the Papaw (Carica papaya), Mammal Apple (Mammea americana), Guava (Psidium pomiferum); all these require moist stove treatment. We can send out to our correspondent in Guatemala to inquire about the others, but you might have to wait a long time for an answer.

INSECTS: H. & C. Caterpillar of the Wood Leopard Moth. Does great injury by boring into and feeding upon the wood of fruit trees, &c. They may be pulled out of their burrows by means of a hooked wire, or injections of tobacco water or soft-soap may be employed.

MELONS: W. A. So far as we can tell, in the absence of information as to culture, we believe your leaves have been scalded by sun-burn when wet. Give more air.

NAMES OF PLANTS: Pleione. 1, Odontoglossum cristatellum; 2, Epidendrum alatum; 3, Catasetum galericium.—G. P. Campanula. Send better specimen with root leaves. The bud in the axil of foliage leaf of Tulip is not a rare occurrence. The ordinary bulbs are buds in the axils of scale leaves.—A. B. S. W. Verbascum nigrum.—J. H. J. Peach Noblesse; Gooseberries—1, Golden Drop; 2, White Champagne; 4, Whitesmith. The Gooseberries were not ripe, and it is difficult to name without seeing them growing, many are so much alike.—A. H. B. Allium Schoenoprasum var. sibiricum.—Subscriber. 1, Hedychium flavosum; 2, Francoa ramosa; 3, Mimulus glutinosus; 4, Salvia patens.—A. H. A. 1, Cedrus atlantica; 2, Viburnum lauratum—wayfaring tree.—C. & S. K. 1, Campanula alliariifolia; 2, Acaena

inermis; 3, *Athyrium f.-f.* Frizella, as near as possible; 4, *Origanum vulgare aureum*; 5, *Bal-lota nigra*; 7, *Anagallis tenella*; 8, *Parnassia palustris*; 9, *Campanula isophylla alba*.—*J. R. H.* 1, *Campanula pyramidalis*; 2, *Galega officinalis*; 3, *Berberidopsis corallina*; 4, *Ceanothus azureus*; 5, *Iibiscus syriacus*; 6, *Phygellus capensis*; 7, *Malva moschata alba*.—*J. C.* 1, *Eleoedendron orientale*; 2, *Selaginella Willdenovii*; 3, *Epi-phyllum truncatum*; 4, *Dracana nigrescens*; 5, *Selaginella casia arbore*; 6, *Rochea coccinea*; 7, *Panax laciniatum*; 8, *Cereus coccinea*; 9, *Cyano-phyllum magnificum*; 10, *Acalypha Macafeana*; 11, *Selaginella Mertensi*; 12, *Rondeletia speciosa*. The Heaths should be sent to some nurserymen who makes a specialty of them. Another time do not send more than six. Our time is valuable.

ONIONS DISEASED: *C. E.* The Onions are badly attacked by a parasitic fungus named *Peronospora Schleideniana*; the latter is an ally of the fungus of the Potato disease, and starts rapid putrifac-tion. As this pest appears with you every year, it would be instructive if you would furnish us, in more detail, with your experience. The fungus is known to arise from resting-spores, which hyber-nate in rotten Onion-refuse and in the earth, therefore ground tainted with the disease should on no account be used for Onions a second season, and all Onion refuse should be burnt or deeply buried. Some Onion growers evade the disease by early seed sowing, and by hastening the growth of the Onions, just as early Potatos escape the Potato disease. *W. G. S.*

ORCHID HOUSES: *T. L. C.* We do not recommend any of the dulled or ribbed glasses for glazing orchid houses. For all purposes of plant culture, good clear glass is the best, as it admits as much light as possible during the dull season, and can conveniently be shaded in summer. If dull glass were used, much needed light is excluded at night and in winter. We advise you to adhere to the old and proved method for glazing the Orchid house you are about to erect.

ORCHID INSECTS: *S. & T.* The insect which has gnawed the leaf of your *Acrides maculosum* is identical with our *Eunaleus albo-costatus*, described and figured in the *Gardeners' Chronicle* for July 25, 1891. It is to be noticed that your insect was found injuring an oriental plant, whilst the one we previously described had attacked a Mexican one. We believe your insect was also an inhabitant of the New World.

POTATOS v. POTATOES: *S.* An old story—our spell-ing was originally accidental. A question was raised and submitted to one of the foremost authorities of the day, who decided that our method was as correct as the other, and that we were only in advance of the time in adopting it, so we retained it.

TOMATO FUNGUS: *J. S. & Sons.* Destroy as many of the affected leaves as you can, and dust the remainder with Tait's Anti-Blight Powder.

THE JUBILEE YEAR

OF THE

GARDENERS' CHRONICLE.

THE *Gardeners' Chronicle* was founded, in 1841, by the late Dr. Lindley, Sir Joseph Paxton, and others. It proved a great success from the first, having then few competitors. As the exigencies of the time have required, it has been trebled in size, so far as horticultural matters are concerned. Illustrations which at one time were few, and given only at intervals, are now numerous and regularly issued. The price has been reduced one-half, and though there are now many competitors in the field, the *Gardeners' Chronicle* is generally recognised as the leading authority in all matters relating to Gardening, Garden Botany, Forestry, and the sciences connected therewith. What others think of it may be judged from the following from among many unsolicited expressions of opinion:—

EXTRACTS FROM THE PRESS.

"THE *Gardeners' Chronicle* has faithfully held to its promises. It is still, to-day, the best gardening journal, being indispensable equally to the practical gardener and the man of science, because each finds in it something useful. We wish the journal still further success."—*Garten Flora, Berlin, January 15.*

"The *Gardeners' Chronicle* celebrated, on Jan. 2, the fiftieth anniversary of its foundation. This is, in [English] garden literature, an unique event. . . . The publication is one of special excellence."—*Vossische Zeitung, Berlin, January 7.*

"The *Gardeners' Chronicle*, one of the most justly renowned horticultural journals of the world, celebrates the fiftieth anniversary of its foundation. The career of this publication, which is an authority in scientific as well as in practical matters, has been most successful and interesting. . . . With such a past, there can be no doubt as to its future."—*Revue Horticole, Paris, January 16.*

"The *Gardeners' Chronicle* is known wherever intelligence in horticulture is appreciated."—*Mechan's Monthly.*

"The first issue of the *Gardeners' Chronicle* for the year is a jubilee number devoted largely to a commemoration of the fiftieth anniversary of that journal's first appearance. Founded by Dr. Lindley and Sir Joseph Paxton, its policy has always been directed by men of accurate knowledge and scientific temper. Its trusted correspondents have been among the foremost of skilled cultivators and recognized authorities in the sciences related to horticulture. During its life of half a century, its influence has tended to elevate and dignify the art of horticulture, not only in England, but throughout the world, and it was never more worthy to command respect than under its present management. Our venerable contemporary is to be congratulated on the possession of so honourable a history, whilst its future is bright with the promise of ever-increasing usefulness."—*Garden and Forest (New York), Jan. 21.*

"We wish to give ourselves the pleasure of recognizing an event in the career of a respected contemporary. . . . The *Gardeners' Chronicle* is the senior by only seven years of the *Journal of Horticulture*, and, to speak paradoxically, we may venture

to say, that both these journals are as young as ever, and disseminate, each in its own way, matter of interest to botanists and horticulturists throughout the world, where the science of botany is studied, and the art of gardening is practised by the community."—*Journal of Horticulture, February 5, 1891.*

"THE JUBILEE OF THE 'GARDENERS' CHRONICLE.'—On January 2, 1841, appeared the first number of a weekly paper which, thanks to the scientific research and practical knowledge of its editors, soon became, and has ever since remained, the principal horticultural medium in England."—*Illustration Horticole, Brussels, Jan. 1891.*

"One of the best conducted English horticultural papers, the *Gardeners' Chronicle*, celebrated the fiftieth year of its existence on January 2. This journal was called into existence by Dr. Lindley and Joseph Paxton. Two of the first and most industrious assistants were the recently-deceased landscape gardener Marnock in the practical part, and James Bateman, who published a series of interesting articles on epiphytal Orchids. Of other eminent writers, there are mentioned the names of Charles Darwin, Dean Herbert, Sir W. Hooker, who, in 1841, was appointed Director of the Royal Botanical Garden, Kew; Sir J. Hooker, Professor Daubeny, Dr. Royle, Henslow, MacIntosh, Curtis, Phillip Frost, Robert Thompson, Robert Fortune, and Berkley."—*Moller's Deutsche Gartner Zeitung, Erfurt, February 1, 1891.*

"For the past half a century, the *Gardeners' Chronicle* has been the leading horticultural and botanical newspaper in the United Kingdom. . . . With such a talented proprietary and staff of editors, it is not surprising that the paper was at once recognized, and took up a leading position as the first horticultural journal of the kingdom. Its success has been very great. . . . Very few of the first working printers on the paper are left to witness the prosperity of the venture, except the writer of these lines (the editor of the *Press News*). . . . The *Gardeners' Chronicle* is still recognized as the leading horticultural journal of the kingdom."—*Press News, January, 1891.*

"The *Gardeners' Chronicle* has just celebrated its jubilee, its first number having appeared January 12, 1841. The founders were Dr. Lindley and Sir

Joseph Paxton. It is to be congratulated upon its long and eminent list of contributors, and upon its constantly increasing usefulness. It is one of those gardening journals that have become a necessity, not only to the practical gardener, but to the professional botanist as well."—*The Botanical Gazette (American), February, 1891.*

"This important journal renders great service in acting as an intermediary between botanists and horticulturists, impressing on the one the true principles of classification and nomenclature, and on the other, the fact that the observation of living plants in the garden teaches many things which cannot be learnt, either in the herbarium or the laboratory, facts which the new generation is disposed to overlook."—*Alphonse de Candolle, Geneva.*

"Let me offer my best felicitation on the semi-centenary jubilee of your splendid *Chronicle*, which you have edited with so much talent, knowledge, and discrimination, for so long a while as the worthy successor of the great Lindley. Wishing the *Gardeners' Chronicle* also in future a splendid success under your able leadership, I remain, *Ferd. von Mueller, Melbourne.*"

"You have brought the *Gardeners' Chronicle* into an admirable condition of prosperity and authority. Of all analogous publications, the *Chronicle*, with no possible reservation, takes the lead. It is more widely read than any of the horticultural journals, owing to its wider circulation. The matter is the most varied, and the illustrations the most correct and elegant. What I wish is, not the continuance and enhancement of your success, for that is certain, as the future will prove, but the continuance of that marvellous energy which has had such excellent results already."—*Maxime Cornu, Director of the Jardin des Plantes, Paris.*

"In 1841, Lindley and Sir Joseph Paxton enriched horticulture with this high-class periodical, in which science has always taken an equally important part with practical information. The issue for the 3rd of last January was devoted to the celebration of the anniversary. The *Gardeners' Chronicle* cannot fail to prosper under its present management, which is conducted with unusual ability and skill."—*Le Jardin, Paris, March 20, 1891.*

THE GARDENERS' CHRONICLE

("The Times of Horticulture")

A WEEKLY ILLUSTRATED JOURNAL,

CONTAINS

PRACTICAL INSTRUCTION & SEASONABLE INFORMATION IN ALL DEPARTMENTS OF GARDENING

Notices of all Horticultural Matters of Current Interest, Reports of Exhibitions, Reviews of Books, and Home, Colonial, and Foreign Correspondence.

Original Illustrations by W. H. FITCH, F.L.S., W. G. SMITH, F.L.S., W. J. WELCH, JOHN ALLEN, and Others.

THE STOTT PATENT DISTRIBUTOR, PATENT SPRAYER, PATENT SYRINGE, KILLMRIGHT,

BEST Insecticide for Destruction of Caterpillar and all Insect Pests, and Prevention of Mildew.

Mr. NORMAN, gardener to the Right Hon. the Marquis of Salisbury, writes as follows under date April 29, 1891:—

Mr. STOTT. The Gardens, Hatfield House, Herts. Sir,—I am pleased to report that I consider your Distributor a very useful invention for mixing your Insecticide Killmright as it passes through the hose, supplied by gravitation.

Your Sprayer is the best I have used. It is very easy to damp a large house of plants with Insecticide without it running into the soil to damage the roots. The Sprayer may be used on either garden engine pipe, or on pipes where the water is laid on.—I am, yours truly, G. NORMAN.

Retail from Ironmongers, Seedsmen, and Wholesale and Retail from The Stott Distributor Co. Ltd., Barton House, Manchester.

THE CHEAPEST & BEST OF ALL. FIR-TREE OIL INSECTICIDE (soluble)

FOR PLANTS.—To make a solution for washing or cleansing purposes.—Half-a-Pint of Fir-Tree Oil to ten gallons of water.

For Green and Black Fly, Thrip, American Blight, Woolly Aphis, &c.—Half-a-Pint of the Fir-Tree Oil to two or four gallons of water, or two or three table-spoonfuls to the pint.

For Red Spider and Caterpillar—Half-a-Pint of the Fir-Tree Oil to two gallons of water, or three table-spoonfuls to the pint.

For Mealy Bug, Brown or White Scale—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight table-spoonfuls to the pint.

For Mildew and Blight on Fruit or Foliage—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six table-spoonfuls to the pint.

For Ants, Grubs, Worms, Wood Lice, &c., in the Soil—Half-a-Pint of the Fir-Tree Oil to two gallons of water.

The most efficacious way to use Fir-Tree Oil in small quantities is to apply it with one of HUNTER'S APPLICATORS.

When applied to the roots of delicate plants the soil should be drenched with clean water immediately afterwards, in all other cases washing is not necessary. Used with Warm Water it is quicker in its action than when cold is used.

Soft or rain water is necessary, and Applied in Wood, Tin, or Pot Vessels.—Galvanized Iron Vessels must not be used.

FOR NITS IN CHILDREN'S HAIR.—Mix one part of Fir-Tree Oil with three parts of Warm Water and apply with a Comb or Brush, the Hair can be washed shortly after.

FOR WASHING FLANNELS & UNDERCLOTHING.—Put a wine-glass full in ten gallons of water for steeping; the same may be put into the boiler. Common Soap may be used but no other preparations.

Sold in Bottles, half-pints, 10s; pints, 20s; quarts 40s; half-gallons 70s; gallons 120 each. Drums, 5 and 10 gallons each, at 11/- per gallon.

A Treatise on FIR TREE OIL as an insecticide, its application to Plants and Animals, sent post free on application to the Manufacturer, addressed to E. GRIFFITHS HUGHES, Victoria-st., Manchester.

WHOLESALE from all the London Seed Merchants and Patent Medicine Houses.

NEW YORK—A. ROBERT & SONS.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sir, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picreua,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by

DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

THE "PERFECT" WEED KILLER

Unrivalled for Destroying Weeds on Garden Walks, Carriage Drives, Stable Yards, etc.

Recommended by the entire Horticultural Press Supplied to Her Majesty's Commissioners of Works and used regularly at Kew Gardens, etc.

PRICE—Gallon 2/; 5 gal. 1/9, 10 gal. 1/6, 40 gal. 1/4 per gal. Carriage paid on 10 gallons and upwards.

Used in the proportion of 1 gallon to 25 gallons of Water.

SOLE MANUFACTURERS: THE HORTICULTURAL & AGRICULTURAL CHEMICAL CO. Works: 97 MILTON ST., GLANGOW.

CAUTION.—Please carefully note our name, address, and trade mark, and do not be deceived by imitations and apparently lower prices of inferior articles. Our manufactures cannot be obtained genuine at Tanbridge, Kent, except from our Agents, Messrs. WIDMILL & WARDLEY, Chemists there.

SLUGICIDE (Registered).—CERTAIN DEATH to SLUGS. Harmless to Plant, Vegetable, and Animal Life. Delicate seedlings are absolutely secure when sprinkled with "Slugicide." 1s. 6d. per box. All Seedsmen wholesale.

THE SLUGICIDE COMPANY, 6, Maryleport Street, Bristol.

GISHURST COMPOUND used since 1859 for Red Spider, Mildew, Thrips, Greenfly and other blight, 2 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to super-ede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICES PATENT CANDLE COMPANY (Limited), London.

ORCHID PEAT.

VERY FINEST QUALITY.

PREPARED ORCHID PEAT, all fibre, ready for use, 10s. per sack; 5 for 47s. 6d.

SELECTED ORCHID PEAT, in Blocks, very fibrous, 8s. per sack; 5 for 37s. 6d.

To Gardeners and Others.

THE LONDON COUNTY COUNCIL is about to APPOINT SUPERINTENDENTS of BROCKWELL PARK, Herne Hill, and WATERLOW PARK, Highgate, and is prepared to receive APPLICATIONS for these APPOINTMENTS. The Salary of the Superintendent of Brockwell Park will be £100 a year, rising £5 every year to a maximum of £125; and the Salary of the Superintendent of Waterlow Park will be £50 a year, rising £5 every year to a maximum of £105 per annum. In each case a residence, free of rates and taxes, and supplied with gas and water, will be provided; but there are no other allowances.

Applicants, whose age must not be less than 35 or more than 45 years, must be practical gardeners, and also capable of managing men and dealing with the public.

Applications must be upon Forms, which can be obtained at this Office, and must be accompanied by copies of not more than three recent testimonials.

Particulars of the duties will be supplied the same time. Applications must be sent in to us on or before September 13, 1891, after which date none will be received.

H. DE LA HOOKE, Clerk of the Council.
 Spring Gardens, S.W., August 13, 1891.

WANTED, a HEAD GARDENER, in Hertfordshire.—An energetic, practical, and obliging Man. He must thoroughly understand his business, and be able to produce a constant supply of the very finest Fruit, Flowers, and Vegetables; also Early and Late Forcing of them. Cut Flowers and Decorative Plants for house and table are wanted all the year round. About eight men are employed. There are between two and three acres of Kitchen Garden, with the usual Tomato, Stove, Cucumber, Grape, and Greenhouses, Conservatories, &c. It is hoped that no one will reply to this advertisement unless he has filled a similar situation before, and is capable of managing the men, and thoroughly well looking after what is usually done in a first-class place. Preference will be given to a middle-aged man, without family.—Letters, with all particulars, must be addressed to Mr. W. B. BINGHAM COX, 26, Southampton Street, Strand, London, W.C.

WANTED, a GARDENER, within twelve miles of London.—A strong, active man, about 25 or 30 years of age, as Second Gardener, where three are kept. Must understand the management of a first-class Kitchen Garden, and have a practical knowledge of Houses, Vines, and all general work.—Write, in first instance, stating age, experience, and other particulars, to C. B. H., Medical Battery Co., Ltd., 52, Oxford Street, London, W.

WANTED, a GARDENER, at Martinmas (November), to work small Market Garden.—Apply, No. 138, Keith & Co., Advertising Agents, Edinburgh.

WANTED, a first-rate WORKING GARDENER. Must thoroughly understand Greenhouses, Frames, and Flower and Kitchen Gardening. Small Orchard. No Forcing. Single-handed, with occasional help; married. Wages, 21s. per week.—Mr. Ivy House, Chertsey, Surrey.

WANTED, a SECOND GARDENER and WIFE, good Landrass.—Address, with full particulars, Mr. CHAMOND, Knoyle Gardens, Salisbury.

WANTED, a SECOND GARDENER, who thoroughly understands Glass Work.—Apply by letter to O. H., Southend Cottages, Fareham, Hants.

WANTED, a SECOND GARDENER, in a Gentleman's garden, not under 21, who is a first-class Grower of Soft-wooded Plants, Orchids, Ferns, &c. Wages, 22s. per week.—C. KERSHAW, Stead Syke Nurseries, Brigg-house, Yorks.

WANTED, a young MAN as PALM and FERN GROWER.—State experience and wages expected, to W. FROMOW AND SONS, Sutton Court Nursery, Chiswick.

WANTED, a good ROSE-BUDDER for a few thousand stocks.—State particulars to GEO. BOLTON, Buntingford, Herts.

WANTED, a good FRUIT GROWER. Well up in Cucumbers.—H. HUXFORD, Anchor-in-Hope Lane Nursery, Charlton.

WANTED, a first-class WORKING FOREMAN, well up in growing Flowers, Plants, Tomatoes, Cucumbers, Melons, &c., for Market. Good wages will be paid to a good man. Apply, with references, &c., to MR. TRAVIS, Plymouth Road, Fenrth, Cardiff.

WANTED, a young MAN, for Lawn and Kitchen garden. One used to mowing machine and scythe preferred. Bothy and vegetable tables.—CHAS. BARNETT, Hilton Park Gardens, Wolverhampton.

WANTED IMMEDIATELY, an experienced MAN in the Nursery, Vinery, Chamber Growing, &c.—Apply, stating wages, A. DUCKERING AND SONS, East Barkwith, Lincoln.

WANTED, AT ONCE, TWO young MEN, with some experience as IMPROVERS, in the Houses. Wages to commence at 15s. per week.—J. CARTER, Wharton Grange, Framfield, Sussex.

WANTED, a young MAN, for Flower and Kitchen Garden.—One used to Spade and Scythe, and about 23 years of age. Wages, 14s. and lodgings.—Mr. HALL, Shiplake Court Gardens, Henley-on-Thames.

WANTED, for a Gentleman's establishment, strong country LAD.—Used to Cows, first-rate Milk-er, and fond of animals. Bothy provided; highest references required.—State wages, to RONALD SCOTT, Esq., The Elms, Acton Hill W.

WANTED, a reliable MAN, for the Houses. A good Grower and Propagator of Bedding and general Soft-wooded Stuff, Ferns, Chrysanthemums, &c. Unexceptional references as to ability, character, &c. required.—State wages (moderate), and full particulars to LANTON BROTHERS, Bedford.

Seed Trade.

WANTED, a young MAN, having connection with Gardeners round London, to Travel.—Address, SEED, Deacon's Advertising Offices, Leadenhall Street, E. C.

WANTED, a strong, active single MAN, for Kitchen Garden work; 15s. a week and bothy. Also a strong active LAD, from 17 to 18, for general Garden work; wages, 12s. and bothy. Must be Roman Catholics.—Apply to the GARDENER, Frenham Place, Farnham, Surrey.

WANTED, AT ONCE, a smart COUNTER-HAND, with experience in executing Bulb and Seed Orders. Wages, 20s. per week.—Apply, by letter, to B. 12, King Street, Covent Garden, W.C.

WANTED, TWO respectable married MEN, as STOKERS. Wages, 24s. 6d. per week.—Apply, FOREMAN, Turnford Hall Nurseries, near Broxbourne, Herts.

WANTED, a young MAN, to assist in the Office as NURSERY CLERK. Must be a good writer, and understand Book-keeping, and willing to make himself generally useful. Good testimonials indispensable.—State age and wages required to GEO. JACKMAN AND SON, Woking Nursery, Woking.

WANTED, a young MAN as SHOPMAN, with a knowledge of Seeds and Bulbs, and assist in Nursery occasionally.—Must be strictly honest and persevering.—State particulars and wages to W. FROMOW AND SONS, Sutton Court Nursery, Chiswick.

WANTED, as STOKER, a steady married MAN, without family, and to make himself useful in the Nursery. Preference given to one who can Paint Greenhouses. Situation permanent to steady man. Wages, 20s. per week, with cottage, fire, and light.—State full particulars to TURNER BROS., Florists and Nurserymen, Garston, Liverpool.

WANTED, an experienced SALESWOMAN, for the Floral Department.—Apply, THE FLORAL DEPOT, Market Place, Nottingham.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first-rate man as HEAD GARDENER, BAILIFF, or FOREMAN; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Staunstead Park Nurseries, Forest Hill, London, S. E.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

GARDENER (HEAD).—J. W. SILVER can with the utmost confidence recommend an exceptionally high class man, as above; of long experience in Fruit and Plant-growing, and the general management of a large establishment. The highest references as to both character and ability.—Streatham and Norbury Nurseries, London, S.W.

J. VERT, Audley End Gardens, informs over fifty applicants (with thanks) that he has ENGAGED a FOREMAN.

GARDENER (HEAD); age 39, married.—W. RICHARDSON, Gardener to Major J. S. Golhe Tamman, S.H.K., The Nunnery, Isle of Man, wishes to recommend his Foreman (James Robman) to any Nobleman, Gentleman, or Lady requiring a good steady respectable man, well up in all branches of Gardening, good Manager of Man.—RICHARDSON or BODMAN, Nunnery Gardens, Isle of Man.

GARDENER (HEAD).—Age 30; married when suited. Fifteen years' experience in all branches of the profession. Midland Counties preferred. Excellent testimonials.—ASHWELL, Bedford Road, Morhanger, Sandy, Bedfordshire.

GARDENER (HEAD).—A gentleman is desirous of recommending his late father-in-law's Head Gardener, who was with him between seven and eight years, during that time giving entire satisfaction, being a thoroughly competent man, with seven under him. Married, with grown-up family; Wife had charge of Dairy and Poultry. Can have personal character.—R. KING, 8, Whiteley's Cottages, Hillingdon Heath, Uxbridge.

GARDENER (HEAD).—Particulars of Advertiser, nearly nine years in present appointment. With testimonials, three in number, on application. Staying until engaged.—ROBERT NELSON, Hwith House, Ravenstone Vale.

GARDENER (HEAD).—Age 29, single; last five years Head Gardener at Quinta d'Achada, Madeira. Thoroughly understands the Cultivation of Vineyards, Sugar-cane, Arrowroot, Fruits, and Flowers. Speaks Portuguese and German. First-class character.—WELLS, Barry Cottage, Stanley Road, Pokesdown, Bournemouth.

GARDENER (HEAD), where two or three are kept.—Age 38; thoroughly practical in all branches. Leaving for no fault, with first-class character.—G. COLLINS, Storrington, Palborough.

GARDENER (HEAD); age 41.—Experienced in all branches, including early and late forcing and management of good establishment. Five years' recommendation.—F. W., 13, Castle Street, Hertford.

£15 Advertiser with information of any Gardening changes that will lead to obtaining an engagement as HEAD GARDENER in a good establishment. Highest references from previous employers.—HURTUS, Messrs. Brown, Gould & Co., 51, New Oxford Street, W.C.

GARDENER (HEAD WORKING).—Age 44; a good all-round Hand. Married, with family. Eight years in present situation, nine and ten previous. Wife could do Laundry work if required.—S. RENDELL, Hawkwell Place, Pembury, Tunbridge Wells, Kent.

GARDENER (HEAD WORKING), where three or more are kept; age 40.—A GENTLEMAN wishes to recommend his Head Gardener as above, to any Lady or Gentleman requiring a thorough good all-round steady and reliable man.—Apply, E. M. HUTTON RIDDELL, Esq., The Bank, Newark-on-Trent, Notts.

GARDENER (HEAD WORKING); age 33, married.—A GENTLEMAN wishes to recommend his Head Gardener to any Lady or Gentleman requiring the services of a thoroughly practical man. Seven years' excellent character.—J. C., 2, Weston Cottages, Pembroke Road, New Southgate, N.

GARDENER (HEAD WORKING); age 33, single.—Mr. FERRIS, The Gardens, Mount Mount, Mill Hill, Hendon, will have much pleasure in recommending his Foreman, J. Jones, to any Lady or Gentleman who may require the services of a thoroughly practical and competent man.

GARDENER (HEAD WORKING).—Fifteen years' practical experience. Grapes, Peaches, Melons, Plants, Orchids, Flower and Kitchen garden, also laying out new grounds. C. RANCE, late of Handcross Park, can with confidence recommend J. H., who has lived with him about seven years.—25, Salisbury Road, Highgate Hill, N.

GARDENER (HEAD WORKING), where not less than three are kept.—Age 40, married, no family; fifteen years as Head, the last three and a half years with Lord Tennyson. Experienced in Vines, Cucumbers, Melons, Tomatoes, Stove and Greenhouse, Fruit, Flower, and Kitchen Garden, Flower and Vegetable Forcing, &c.—F. PAY, Hawk's Hill, Bourne End, Maidenhead, Bucks.

GARDENER (HEAD WORKING), or good general FOREMAN; age 28.—Mr. FRIEND, gardener to the Hon. P. C. Glyn, Bookham, Godstone, can confidently recommend a thorough practical man as above; fourteen years' experience, including Orchids and Chrysanthemums for exhibition.

GARDENER (HEAD WORKING), where five or six are kept.—Excellent experience and character; abstainer.—GARDENER, 29, Stadium Street, Ashburnham Road, Chelsea, S.W.

GARDENER (HEAD WORKING).—Age 30, married, one child (1 year); abstainer. Life experience in Peaches, Melons, Cucumbers, Tomatoes, Mushrooms, Stove and Greenhouse Plants, Flower Gardens, Chrysanthemums, &c. Kitchen Garden a specialty, and Early and Late Forcing. Excellent references as to ability and trustworthiness.—GARDENER, Little Brickhill Manor, Bletchley, Bucks.

GARDENER (HEAD WORKING).—Age 28; married, no family. Fifteen years' practical experience in all branches. Excellent character.—A. C., Melway Villa, Paddock Wood, Kent.

GARDENER (HEAD WORKING).—Age 32 married; seventeen years' good and varied experience in all branches. Good references from present and previous employers.—J. R. Albert Road North, Reigate, Surrey.

GARDENER (HEAD WORKING).—Age 39, married; a thoroughly good, practical, and competent Gardener. Twenty-three years experience in Growing Grapes, Peaches, Figs, Melons, Cucumbers, Mushrooms, Tomatoes, Stove and Greenhouse Plants, Flower and Kitchen Gardening, and Early and Late Forcing. Abstainer; highest references.—GARDNER, Oakwood, Chichester, Sussex

GARDENER (HEAD WORKING or good SINGLE-HANDED).—Age 32, married; seventeen years thorough experience. Four years' character from last situation.—A. G., 2, Lime Tree Cottages, Lower Mitcham, Surrey.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 37, married. Thoroughly practical in every branch of the profession. Good character.—J. ARNOLD, Cotesbach Hall Gardens, Lutterworth.

GARDENER (HEAD WORKING).—Married, two children, (youngest age 2); thoroughly experienced in Early and Late Forcing, &c. Highest reference from present employer.—T. W., 7, Edingham Road, Reigate.

GARDENER (HEAD WORKING), where two or three are kept.—Age 38, married, five children. Sixteen years' character.—W. RIGDEN, 31, Belford Road, Ealing Dem.

GARDENER (HEAD WORKING); age 40, married, three children.—A Gentleman wishes to recommend a trustworthy man, who has been with him eleven years, as above. Thoroughly experienced in Forcing, and in all wages; also Land and Stock. Total abstainer.—W. C. R., Cobbe Priory, Shaftesbury; for character and ability to Milk Beaufoy, Esq., M.P., 1, Holme Lea Terrace, Lyme Regis.

GARDENER (HEAD WORKING).—Thoroughly understands his work in all its branches. Wife could do Cooking or Dairy, if required. Good character.—E. BAKER, Telli-ford Rectory, near Bath.

GARDENER (HEAD, or SINGLE-HANDED).—A CLERGYMAN desires to recommend his present Gardener to a Clergyman or Private Gentleman. Flowers and Vegetables, Greenhouse, &c. Twenty years' experience. Good character; abstainer.—H. MILLER, Gardeners' Lodge, R. A. College, Cirencester.

GARDENER (HEAD, or good SINGLE-HANDED)—Age 39, married; six years in Duke of Bedford's Gardens, three in present situation. Good characters from both.—W. H. REEN, Berry End, Eversholt, Woburn, Beds.

GARDENER (WORKING), where help is given.—Middle age, married, no family. Wife could help in the house. Four years' good character. E. B., 1, Bath Cottages, Eastworth, Chertsey.

GARDENER (SINGLE-HANDED).—Age 37; married, three children. Five and a half years' good character. No objection to horse or cow.—J. E., 98, Dorset Road, Clapham, S.W.

GARDENER, or GARDENER and BAILIFF.—Mr. F. H. CRASP, Canford Manor, Wimborne, can strongly recommend a first-class man as above. Excellent Grower of Fruit, Plants, Flowers, and Vegetables, and a good and economical Manager of a gentleman's place generally. Unqualified testimonials and highest references.

GARDENER, where two are kept, or Single-handed.—Age 23; ten years' experience. Good character and references.—S. W., East Norton, Leicester.

GARDENER.—Age 40, married, no family; good all round. Wife a good Cook.—R. F., 48, St. Gothard's Road, West Norwood.

GARDENER (SECOND), or FOREMAN, in a good establishment.—Age 21, single. Bethy preferred. First-class references from past and present employers.—STEPHEN MALLETT, Morpeth House Gardens, Ipswich.

GARDENER (good SINGLE-HANDED, or where help is given)—Age 40, married. Thoroughly understands Vines, Fruit, Flower, and Kitchen Gardens.—H. S. BARLEY, near Royston, Herts.

GARDENER (SECOND or UNDER).—Age 22; two years' good character.—A. LONGHURST, Mr. Gatward, West Street, Ewell, Surrey.

GARDENER (SECOND), where three or four are kept.—Age 24, single. Ten years' experience Inside and Out. Good references.—W. M., 39, Pope Road, Bromley, Kent.

GARDENER (SECOND), where four or five are kept; or JOURNEYMAN, in a good establishment; Inside preferred.—Age 25; two and a half years' excellent character.—W. ABBOTT, 55, Peckwater Street, Kentish Town, London, N.W.

GARDENER (SECOND or UNDER).—Four years' experience Inside and Out, under a Gardener. Good character. State particulars.—A. MOORE, Lynsted, near Sittingbourne.

GARDENER (UNDER), Inside and Out.—A young man, age 13. Six years' experience. Good character.—J. MILLS, The Gardens, Keaton Court, Sunbury, Middlesex.

GARDENER (UNDER), or SECOND in the Houses.—Age 22; can be well recommended. Five years' experience in private establishment.—A. J., Ladd's Nursery, Swanley, Kent.

GARDENER (UNDER).—Age 20; willing to make himself useful, in Gentleman's Garden preferred. Good references.—DIX, The Cottage, East Sheen Lodge, Sheen, Surrey.

GARDENER (UNDER, or SINGLE-HANDED).—Age 21. Good character; can be well recommended.—W. T., 3, Collin Street, Blackheath, Kent.

GARDENER (UNDER).—Age 22; five years' experience. Inside and Out, and can have five years' references, if required.—H. YOUNG, Bidley Road, Winton, Bournemouth, Hants.

GARDENER (UNDER, or SINGLE-HANDED).—Age 28, single; good character. Willing to be generally useful.—H., 7, Chatham Road, Camberwell, S.E.

GARDENER (UNDER).—Age 21; under Glass. Six years' experience. Good character.—J. TULK, Watergore, near Ilminster, Somerset.

GARDENER (UNDER), in a Gentleman's Establishment.—Age 23; can be well recommended. Eight years' experience Inside and Out. Good character.—W. BROWN, Colley Cottage, Reigate Heath, Surrey.

GARDENER (UNDER), age 20.—Wishes to gain experience in Gentleman's establishment; good character; both preferred.—W. A. POLLARD, 4, Hatfield Grove, Douglas, Isle of Man.

MANAGER.—Situation wanted in a first-class Seedsman's, Florist, and Fruiterer's Business. Well up in all branches, Buying and Selling.—Apply, by letter, stating wages, &c., to A. R., Mr. H. Bidley, 46, Avelin Street, Fulham Palace Road, Hammersmith, W.

IMPROVER, for the FLORIST'S BUSINESS.—A young Lady seeks an engagement as above about August 24.—F. C., Mrs. Mev, 54, Long Row, Nottingham.

HOLLOWAY'S PILLS.—Hale Constitutions. —When the human frame has become debilitated from the effects of exposure, excesses, or neglect, these Pills will repair the mischief. If they be taken according to the lucid directions wrapped round each box, Holloway's Pills exert the most exemplary tonic qualities in all cases of nervous depression, whereby the vital powers are weakened, and the circulation is rendered languid and unsteady. They improve the appetite, strengthen the digestion, regulate the liver, and act as gentle aperients. The Pills are suited to all ages and all habits. A patient writes:—"Your Pills to be valued require only to be known. During many years I sought a remedy in vain, was daily becoming weaker, when your Pills soon restored me."

MR. J. C. STEVENS will **SELL** by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **MONDAY, WEDNESDAY, and SATURDAY** NEXT, August 24, 26, and 29, at half-past 12 o'clock precisely each day, extensive importations of BULBS from some of the best-known farms in Holland, just received in splendid condition, comprising most of the best sorts of Double and Single HYACINTHS, TULIPS, CROCUSES, NARCISSUS, SNOW-DROPS, SCILLAS, IRIS, &c., &c., specially lotted to suit the Trade and other large Buyers. Also EARLY WHITE ROMAN HYACINTHS, PAPER WHITE and DOUBLE ROMAN NARCISSUS, 5000 LILIUM HARRISII for forcing, 8000 Home-grown LILIUMS, &c.

On view mornings of Sale, and Catalogues had.

Pendell Court, Betchingley, Surrey.
MR. J. C. STEVENS will **SELL** by AUCTION on the premises, as above, on **WEDNESDAY** September 2 and following day, at 1 o'clock precisely each day, by order of the executors of the late Sir G. Macleay, the COLLECTION of ORCHIDS, including many of the well-known kinds; Specimen PALMS, TREE and other FERNS, GREENHOUSE PLANT, STUCCULENTS, EUCHARIS, LILIES, &c. Also two COWS, Horse, two Carts, two Ricks of Hay, Iron Tanks, Garden-seats, Vases, Lawn-mowers, Greenhouses, &c., &c.

On view the day prior, and mornings of Sale; and catalogues had on the Premises, and of the Auctioneer, Offices and Rooms, 38, King Street, Covent Garden, W.C.

Monday and Thursday Next.

DUTCH BULBS. SPECIAL TRADE SALES.
MESSRS. PROTHEROE AND MORRIS will **SELL** by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **MONDAY and THURSDAY** NEXT, large consignments of named Hyacinths, Tulips, Crocuses, Narcissus, and other Dutch Bulbs, together with white Roman Hyacinths and Paper White Narcissus, received direct for unreserved sale. These early auctions have been specially arranged in lots to suit the trade, and other large buyers. The Auctioneers will be pleased to enter the names of intending purchasers in their permanent lists, who may desire a regular supply of catalogues for these sales.

Friday Next.
CATTLEYA ALBA,
LELIA PRESTANS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and 213, Park Road, Clapham, S.W., to **SELL** by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **FRIDAY** NEXT, August 28, at half-past 12 o'clock, a remarkably fine lot of CATTLEYA ALBA, brought home personally by the Collector. The plants were collected in the same locality, whence came the plants we had the two previous years, and which turned out such an exceedingly fine lot, amongst which flowered C. aurea marmorata, C. Missalana, C. Harlyana, and other choice forms. Many good things may be expected out of this importation, we can assure intending buyers the plants are well-leaved and without doubt the finest lot ever offered.

Also a very healthy lot of LELIA PRESTANS, ONCIDIUM VARIOSUM ROGERI, CATTLEYA SCHOFIELDIANA, ODONTOGLOSSUM RAMOSISSIMUM, a pretty winter-blooming Orchid; these are a grand lot. CATTLEYA LODDIGESI, just to hand; ROULETTIA, new species, semi-established; COLAX JUGOSIS, ONCIDIUM DASYPYLE, the Orchid; O. PHYMATOCHEILUM, O. MICROPOZA, CATTLEYA LEOPOLDI, ODONTOGLOSSUM HARRYANUM, to hand, ZYGOPETALUM GRAMINIFOLIUM, &c.

On view morning of Sale, and Catalogues had.

THE
Gardeners' Chronicle.

SATURDAY, AUGUST 22, 1891.

THE WINTER OF 1890-91,
AND THE BIRDS.

UNUSUAL movements of the European bird population took place during the past winter, and many sportsmen and naturalists in all parts of the country reported the visitations of rare birds. The taxidermists, too, everywhere received for preservation species of birds which do not often reach them. A taxidermist at Manchester, for example, stuffed a whooper, or whistling swan, from the Isle of Man, and a bittern from Warrington.

Swans of several kinds were exceedingly numerous in many districts, and flocks of ten or a dozen, and even of a hundred, appeared in several parts of Ireland, especially in the north. In Pevensey Marsh, Sussex, birds of this noble species were seen, and shot during the winter. Heron Court, Christchurch, Hants, the residence of the Earl of Malmesbury, was always noted for wildfowl, but if we may judge from the past winter's record compared with that of 1888, wild swans were not so numerous in that part of the country as they were half a century ago.

The great bustard was the most conspicuous of the rare birds that visited this country during the long frost. The extensive moors and heaths which used to tempt the bustard to reside and breed in England have long since been cultivated, the marshes which harboured the bittern have been drained, and both these species have since become winter visitors, neither of them venturing to nest here. They are both occasionally met with, but the bustard especially is now a very uncommon bird. The immigration of bustards, however, during the winter months was greater than in any winter since that of 1879-80. In that season nine specimens were reported in the pages of the *Field* and *Zoologist*, since that date the only specimen reported, but not procured, was seen in Dorsetshire in 1888. In the *Proceedings of the Dorsetshire Natural History and Antiquarian Field Club*, this bustard of 1888, which appeared in the unusual month of May, is described (vol. xi.) as having been seen by a keeper in the employ of Sir Richard Glyn. "It could run," said the keeper, "at a fast rate, but did not seem to fly with ease." A description coinciding exactly with an account of the flight of bustards witnessed a hundred years ago on the Downs, near Salisbury, by Chafin, and noticed by him in his *History of Cranbourn Chase*.

In the recent visitation of bustards, not less than seven were reported in the *Field* as having been seen and mostly shot by various persons in different districts. If these big birds had found their way to our fields by virtue of what is called "hereditary memory," they would certainly

BUYERS SHOULD COME AND VIEW THE STOCK.

TWO GRAND NOVELTIES.

A PURE WHITE BEDDING CLEMATIS, and the FERN which has lately received so many of the highest awards and proofs of admiration.

CLEMATIS SMITH'S SNOW-WHITE JACKMANII.—The flowers are paper-white, about the same size as those of the old purple Jackmani, but produced in even greater profusion. It is unrivalled for beds, and also for climbing. Ready in August. 7s. 6d. each.

PTERIS TREMULA SMITHIANA.—This is a very valuable and distinct Fern. No Collection should be without it. Illustration and description free. 5s. to 10s. 6d. each.

BULBS.—The best procurable.

STRAWBERRIES.—All leading kinds. Descriptive LISTS free.

Also all the best varieties of CLEMATIS ready for planting out.

RICHARD SMITH & Co.,
Nurserymen and Seed Merchants,
WORCESTER.

re-visit their old haunts, such as the heaths and downs of Norfolk and Dorset, and the wide expanse of Salisbury Plain—and they would come in the breeding season. But the instinct of season and locality, which brings back the nightingale and swallow every year to the same copses and chimneys, almost to a day (about April 13), may be lost, it seems, in about a hundred years. This kind of instinct is at any rate extinct in the bustard, the bird having wandered hither and thither without the least knowledge of its habitats of the last century. One was shot near Southminster, Essex, another in Christmas week in Carmarthenshire weighing 8 lb., another near Romsey, Hants, by a gentleman who was out partridge shooting when he saw a wild goose, as he imagined, rise from the centre of a field and fly slowly away. It was afterwards bagged when flying 20 yards above the sportsman's head, and it proved to be a female bustard weighing 10 lb.

The neighbourhood of Winchelsea also contributed its bustard to the season's bag; so has the country near Norwich and the Chippingham district, Wilts, the bird shot in the last-named locality measuring 5 feet from tip to tip of wing, and weighing 9 lb.

All the bustards of the present visitation were females, as they were, save one male, at the time of the immigration of eleven years ago; so it would seem that the male birds are either more wary and keep out of harm's way, or that the sexes do not travel and consort together, or did not do so in visiting the *terra incognita* of England last winter. In the case of several species of birds, the sexes sometimes separate during migration, the hen chaffinches, for instance, remaining in the north of England when their past and future mates have departed for the south.

On the road between Stratford-on-Avon and Warwick, and within a mile of the former town, a golden eagle, mobbed by rooks, was seen gracefully wheeling above a small covert near the road. After perching on an Elm tree, and affording a spectator, a naturalist, an opportunity of observing its markings, it sailed away northwards, in the right direction for the crags and peaks of Scotland, where, we may hope, it found a much safer sanctuary than it could look for in Warwickshire.

Two species of wild swans, Bewick's and the whooper, took up their winter quarters in Scilly, on a sheet of water in front of the windows of Tresco Abbey, remaining for months, whereas wild swans in Scilly have usually remained only a few hours. In November five were seen, but they wended their way without being identified. On December 5 two whoopers appeared, were shot at, and were not seen again. Then twelve swans settled on one of the two pools at the Abbey, and, as wild swans are not often met within the limits of the British Islands, the sportsmen of Scilly found the opportunity too good to be lost, and four of the Bewick swans were shot. Four of the remaining eight were not seen again, the other four reappeared next morning, apparently unperturbed, though they were found on the very spot where they had been shot at the night before.

We may presume that these intelligent birds understood the exigencies of such a winter as the last, and they preferred grass in Scilly, and abundant waterweeds, taking their chance of powder and shot to the certainty of starvation in the frozen waters of the North. The hospitality they seemed to crave was granted them, and, finding themselves unmolested, they settled down for the winter, and in a few days they were

joined by six whoopers which had been previously observed flying about the islands.

An excellent opportunity was now offered of observing some of the habits and characteristics of wild swans, at home on a sheet of water only 200 yards or 300 yards from a window, where their movements could be minutely observed by means of a mounted telescope. Mr. Jenkinson, of Crowborough, Sussex, who told the story of this rare inspection in the *Field*, has been all his life an enthusiastic collector of birds and observer of their habits, and has enjoyed some thrilling moments when engaged in these pursuits, but he admits that he never experienced so keen a sense of delight, amidst his natural history inquiries, as when, during several weeks, he watched the habits of the wild swans at Tresco Abbey.

Two whoopers were reluctantly shot to add to the collection, but the swans had become so accustomed to the place that they seemed only slightly scared by the attack. For a few days only they remained on the sea in the daytime, and then settled down for the winter, with the telescope as the only tube turned in their direction. There were now eight wild swans under inspection, four Bewick's and four whoopers, a graceful group—the last-named members of which, in the eyes of all the spectators, quite outshone their companions for grace and beauty. The longer neck and body of the whooper, and its more elegant head, gave the other species in companionship with it, almost a common appearance by comparison. Wild swans differ from the tame, or mute species, by swimming with the necks erect, and, however graceful a curved neck may be, there is a fascination, such as tame birds do not inspire, in seeing the wild species wary and watchful, with necks erect and heads lifted to detect the approach of danger. The tame swan, under similar conditions, would probably carry his head as high as he could. He is a beautiful bird, but after all, when one compares him with his wild congener, that habit of sailing about with the neck curved, looking out for bisenits, fussy, and inclined to hiss, savours rather of a poultry-yard. The charm of the wild swan may be partly due to the fact of its being wild and rare, and an altogether unusual object to be seen from the windows of one's own or any other house. Such an inspiring spectacle was seen last winter by a very few persons in Great Britain, less perhaps than a dozen, and it may be worth noting for its novelty, and not likely to be again witnessed for years.

The two species, Bewick's and the whooper, kept near together, sitting all day in the shallow water near the edge, only a few yards apart, but never mixed up for more than a moment or two. To their credit, be it said, they were perfect friends, associating on terms of social equality, but, with great good sense, they clearly obeyed some unwritten law of precedence, and if any question of being in each other's way arose, the Bewick always gave way to the whooper. They proved very tolerant of other birds, and even when feeding took no notice of the numerous coots moving about in their midst, and sometimes swimming close to their beaks, helping themselves apparently to the weeds which the swans dragged to the surface of the shallow water. They all fed most at night, and the whole of them would often remain in the shallows the greater part of the day, standing on one leg with their heads turned over their backs, as if in sleep. But it seems to have been a very wakeful and a watchful sleep, for the telescope invariably revealed one eye always open, and the heads were up the instant man or

beast appeared in sight. The native place of the visitors, was, of course, unknown, but it must have been in high latitudes, where agriculture does not flourish, for it was observed that cattle excited their fears as much as man himself.

They soon became accustomed to the passing of carts at a reasonable distance from the banks, and to the loud talking of the drivers. Every evening they all flew away to a larger pool over the hill, where they passed the night, returning in the morning. The whoopers were in the habit of starting into flight without a cry, but the other party made a little ceremony of the matter, first one uttering a musical cry, then another, and presently all would join in chorus, like a pack of hounds in full burst, and then they were off. In the morning the whoopers, on alighting, would spend some time in splashing and flapping about, and in daintily dressing their plumage. One could see at a glance that the neck of the wild swan is more slender than that of the coarser mute. The alighting of the birds after flight was a fine sight. One after the other, the two parties would sweep down out of the air, and settle on the water—a performance not to be forgotten by any whose good fortune has enabled them to witness it.

A very large number of other unaccustomed birds of a less conspicuous kind might be named, but they only read the same lesson of the freezing out of these birds in their usual haunts, and of their wanderings in search of food. A sadder story, with the same moral, might be told of the enormous mortality amongst our native birds, starved and frozen, as they were, on their perches, in rabbit burrows, or in the crevices or the ivy of old walls, during the great frost of 1890—91. Gilbert White said of the remarkable frost of 1776, that the partridges were so thinned, that few remained to breed the following year H. E.

ORCHID NOMENCLATURE.

The August number of the *Kew Bulletin* contains a pronouncement as to what Kew is, and what it is not prepared to do with reference to the naming of Orchids. A general review of the situation before and after the death of Professor Reichenbach is given, and then comes this statement:—"It is the business of botanical science to furnish such plants with names under which they can be recognised, and with technical descriptions, by means of which the names can be fixed, and the plants identified."

In these days of "cultural strains" and hybrids, however, it is obvious that something more is required, and this something more Kew is, as we understand, not prepared to undertake; indeed, when the Kew authorities were asked to appoint a representative to act on a committee appointed by the Royal Horticultural Society to consider the rules, which in the opinion of the committee should be followed in the naming of Orchids for garden purposes, the application was met with a distinct refusal from the Director:—"This is a task," he wrote, "which the . . . Orchid Committee is well qualified to take up. But the principles of botanical classification have nothing to do with the matter, and botanists should, in my judgment, not meddle with it. It appears to me that Orchid growers will create their own standards of excellence with regard to the cultivated varieties of Orchids, just as with any other florists' flowers. Such a standard will be a matter of taste and judgment, not of science, and horticulturists are entitled to name on a purely horticultural basis any form

which they wish to recognise as distinct when they have secured adequate evidence of its permanence. . . . Such forms should be distinguished by vernacular names, so that they may be no longer confused with botanical varieties, and the Committee should register such names as having its authority, accompanying the name in each case with such distinctive marks as may serve to define it. In the work of the Committee, as above defined, I do not see that any member of the Kew scientific staff could give any effective assistance. I must further point out that our officers are already hard-worked, and the absence on extraneous duties of those who work during prescribed official hours is contrary to the regulations of the Civil Service."

It is well to have definite statements like this, and it is easy to see that from the writer's standpoint they are perfectly reasonable, but the matter must be looked at from other points of view. The interest of varieties and of hybrids of known parentage is assuredly as great as that of so-called species, and an accurate description and record, under existing circumstances, is just as great from a scientific point of view as that of assumed species, if not more so. The horticultural value, or the importance, of Orchids as "florists' flowers" is quite another matter, and one which, as the Director says, is entirely within the competence of the Orchid Committee, although that body as such is not competent to decide upon the intricate scientific questions above mentioned, and is, as we believe, not disposed to meddle with them. In the meantime, a new departure has been taken in the *Bulletin*, by the publication of the first decade of "New Garden Orchids," by Mr. Rolfe, some notes relating to which are subjoined.

NEW OR NOTEWORTHY PLANTS.

BOTANICAL descriptions of the following ten species are given in the August number of the *Kew Bulletin* by Mr. R. A. Rolfe:—

PHYSOSIPHON GUATEMALENSIS, Rolfe.

A small species, which appeared with *Odontoglossum grande*, in the Glasnevin Botanic Garden, where it flowered in June, 1890, and again during the present year. On each occasion it was sent to Kew by the Curator, Mr. F. W. Moore, for determination. It is nearly allied to *P. Loddigesii*, Lindl., and has similar deep yellow flowers, but is smaller in all its parts, especially in the much shorter tube of the sepals.

BULBOPHYLLUM DENTICULATUM, Rolfe.

A small species from Sierra Leone, sent to Kew by Mr. James O'Brien in May of the present year. The flowers are about 3 lines long, and are borne in a somewhat drooping spike. The sepals are pale purple-brown, the petals white, with strong purple mid-nerve, and very narrow purple denticulate margin, and the lip orange. The name is given in allusion to the denticulate petals.

BULBOPHYLLUM NIGRIPETALUM, Rolfe.

A very distinct and remarkable species, which has the petals and lip of a uniform purple-black, in allusion to which the name is given. It was originally introduced from West Africa by Messrs. F. Sander & Co., of St. Albans, and grown by Mr. J. O'Brien, with whom it has flowered on two or three occasions. In habit it somewhat resembles the preceding, but has longer racemes; the scapes and ovaries are glaucous-green, and the sepals pale yellowish-white, with light maroon lines.

MEGACLINIUM CLARKEI, Rolfe.

A native of West Africa, which has flowered in the collection of Major Trevor Clarke, of Daventry, during May of the present year. It is allied to *M. oxypterum*, Lindl., but differs in certain botanical

details. The flattened rachis, which is the most remarkable feature of the genus, is four lines broad, light green down the centre with purple-brown spots, almost wholly purple-brown near the margins, and the flowers somewhat similar in colour.

MEGACLINIUM LEUCORACHIS, Rolfe.

A remarkable species, with the rachis nearly white, quite unlike any other, and therefore named in allusion to this character. The flowers are deep yellow. It appeared with Sir Trevor Lawrence, Bart., M.P., of Burford Lodge, Dorking, and like other species is probably a native of some part of Africa. It was sent to Kew for determination in May, 1890.

PHOLIDOTA REPENS, Rolfe.

A small species with light flesh-coloured flowers, sent to Kew by Mr. J. O'Brien in June, 1890, and again during the present year. It is a native of some of the hills of India. It is allied to *P. Griffithii*, Hook. f., of which it may be an usually procumbent variety, with differently coloured flowers.

EPIDENDRUM MOOREANUM, Rolfe.

Over 200 species of *Epidendrum* have been described since the publication of Lindley's *Folia Orchidacea*, but the genus does not appear to be yet exhausted. The present novelty exists in several collections, and has been sent to Kew for determination, by Mr. F. W. Moore, Mr. W. Bull, Messrs. Hugh Low & Co., and Sir Trevor Lawrence. It belongs to the section *Eacyclium*, and is allied to *E. stellatum*, Lindl. The flowers are very fragrant, the sepals and petals light green, and the lip deep purple with light green margin. It is said to be a native of Costa Rica, and is named after Mr. F. W. Moore, of Glasnevin, who first sent it to Kew.

POLYSTACHYA BULBOPHYLLOIDES, Rolfe.

A minute and very anomalous species, with the habit precisely of *Bulbophyllum*. It is a native of West Africa, and was sent to Kew by Mr. J. O'Brien, in July of the present year. The small diphyllous pseudobulbs are borne at intervals on slender creeping rhizomes. The flowers are white except two orange spots on the lip, and a light purple margin to the column. The petals are reduced to a pair of minute fleshy tubercles, but otherwise the flowers are identical with those of *Polystachya*.

RENANTHERA IMSCHOOTIANA, Rolfe.

A handsome species, allied to *R. coccinea*, Lour., and *R. Stortii*, Rehb. f., but with flowers in simple racemes, and various structural differences. It was sent to Kew by M. A. Van Imshoort, of Gand, Belgium, during July of the present year, with the information that it was received with *Aerides Godefroyae*, Rehb. f., from Messrs. F. Sander & Co., of St. Albans, and is believed to be a native of the same country. The flowers are chiefly of a reddish-vermilion shade.

PELEXIA OLIVACEA, Rolfe.

A native of the Andes, sent to Kew by Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, in April 1890, where it flowered about a year later. It is one of those plants formerly referred to *Neottia*, though erroneously. The leaves are dull olive-green, with a broad irregular silvery band on either side of the midrib, the scape, ovary and sepals also olive-green, the petals and lip white, with some yellow on the mouth of the tube formed by the union of the column with the stalk of the lip. *R. A. Rolfe.*

SCILLA BIFOLIA VAR. WHITALLII, Baker.

Mr. E. Whittall, of Smyrna, has just sent to the Royal Gardens, Kew, bulbs and dried specimens of a very distinct new variety of *Scilla bifolia* from the heights of the Taurus. It has as many as a dozen bright blue flowers in a dense raceme. The leaves are three or four in number, instead of two, as in the type, and they are narrow, linear (not above a twelfth of an inch broad), channeled down the face, and fully developed at the flowering-time. I propose to name it as above, in recognition of the many interesting plants which Mr. Whittall has sent from various parts of Asia Minor to England during the last few years. *J. G. Baker.*

WELBECK ABBEY GARDENS.

(Continued from p. 186.)

It would be interesting to trace the history of this place, and how it came to be connected with the Dutch family, the Bentincks, but the place has so many claims from a horticultural and landscape point of view, that it will be better to plunge *in medias res* at first. The park has been a park from time immemorial, of which fact some of the old Oaks are the best proof. The Greendale Oak, as it is called, must be 800 years old, it used to be 33 feet in girth at the bottom, and its branches used to cover a space of 2700 square yards. Other famous trees are the Duke's Walking-stick, the Two Porters—so-called because there is a gate between them, and a clump of gigantic specimens called the Seven Sisters. The park is 10 miles in circumference, and contains forty-one lodges, all goodly houses built of Streetley stone.

I must ask my readers to start where I started. This was from the quadrangle outside the garden walls, an open space, with substantial stone buildings all round, the most prominent of which was an erection that looked somewhat like the Crystal Palace, and used as a riding-school. The central aisle is roofed with glass, and the two side aisles, with their fine groined roofs, look like a cathedral. A tunnel, well lighted, leads from this to the Abbey, a distance of a mile and a quarter. This was the work of the late Duke, as was the work of tunnelling the public footway through the park. The underground passage leads out into a glass corridor 140 yards long. Along the whole length of this, Roses are planted out in tubs, which are 2½ feet every way. The Roses have not covered the roof yet except at the top; when they all grow up, the effect will be one of the most magnificent floral displays to be seen anywhere. I believe that as many as 400 *Maréchal Niel* blooms have been cut off from these plants in one day. As Roses on such a scale have hardly been imagined before, a list of those mostly used may be welcome. They are *Madame Lambard*, *W. A. Richardson*, *Madame de Watteville*, *Rubens*, *Marie Van Houtte*, *Souvenir d'un Ami*, and *Anna Olivier*. Near this corridor is a sunken Rose garden 2 acres in extent; there is a wall all round planted with *Marie Van Houtte*. In front of the wall all round is a herbaceous border, enriched with all the treasures of Mr. Backhouse's collection. There are twenty-four large beds cut in the lawn in the centre, each devoted to a single variety of hybrid perpetual, the colours being grouped so as to contrast. The sorts used are *Etienne Levet*, *La France*, *Madame Victor Verdier*, *Anna de Diesbach*, *Marshall Wilder*, *Dr. Andry*, *Marguerite Brissac*, *Madame Gabrielle Luizet*, *Marie Finger*, *La Rosière*, *E. Y. Teas*, *Merveille de Lyon*, *Mrs. Harry Turner*, *Madame Eugène Verdier*, and *Baron Haussmann*. On account of being so well sheltered by their sunken position, they never fail to do well in any season.

Emerging from this pleasant retreat, one comes upon a broad gravel walk, with close-cropped lawns on either side, and leading to the west front of the Abbey. A pretty effect is given by the graceful curves of the shrubberies which accompany the walk. Close to the Abbey are the chapel and library, and a fountain. In front of the house, on the south side, is a broad stretch of green sward, which is used as a cricket ground, and in the background the old Oaks of the park. On the left the lake seems like a wide silvery river disappearing among the trees; the outline of the lake is very effective and bold. On the east side the lawn slopes down to the lake. There is a tablet here erected to the memory of Jane Cavendish, who held out against the Parliamentary army, and was treated with great courtesy by old Noll.

It is on the remaining side, however, that the great beauty of Welbeck Abbey lies. Here pleasure grounds have been laid out on a scale only found in one or two places besides, and thousands of *Rhododendrons* and shrubs planted. There are avenues of nearly every well-known species of Conifer. The longest avenue is of young Limes. On either side of

the path leading down this, are flower beds and circular clumps of Rhododendrons, more than 100 of each; the blaze of colour from such an enormous number of beds simply defies all description. This walk ends in a Laurel bank, close to the foot of the lake, which with great taste has been formed into an aquatic garden. Here Nuphars and Nymphæas have been naturalised, together with nearly all the hardy aquatics. The bank above has been utilised as a rock garden, and planted with a choice collection of suitable plants, many rare species being represented. Running parallel with the avenue of Limes is a grass walk, leading to the Rhododendron valley. Near this walk are some underground greenhouses, which one could easily pass without noticing. These are in connection with the longest tunnel, and are used for growing the bedding plants, in order to save the trouble of transporting them from the kitchen garden. The number of plants required is, as may be imagined, enormous, but the able foreman of this department seems well able to cope with the demand. The most used Felargoniums are Corsair, Crystal Palace, Black Prince, and Mrs. Holden. The glass roof is on a level with the ground; underneath this, on a trellis, is spread about 6 inches of leaf-soil, in which the young Geraniums and Fuchsias are taken out of their small pots and plunged. Being so near the light, they were growing most luxuriantly, and would evidently make finely-rooted plants by the time they were wanted. One had to approach to look at them from the tunnel by a trap-door and ladder. The number of Lobelias and Sunray Fuchsias grown, I am afraid to say, lest I should be accused of exaggeration. The Rhododendron valley, leading back to the Abbey, must have been an enormous undertaking. On either side is a wide shelving bank of Rhododendrons, and as the natural soil is not suitable, thousands of loads of prepared soil had to be carted into position. Where this soil has been renewed, the plants are more vigorous—so much so, that it is intended to renew the soil all along. This valley forms the approach to two most perfect glasshouses. The first is a Palm-house, see fig. at p. 195; it is almost square, of a great height, and supported by two rows of pillars. Huge Livistonas, Chamæropes, Cycads, and Dicksonias are growing in sunken tubs. The walls are all covered by Begonias and Ferns growing out from soil, held to the walls by wire-work; and so well tended that there is not a weak place anywhere. Of the Ferns the different Blechnums and *Stenochlæa scandens*, with long dimorphous fronds borne on scandent rhizomes, were very conspicuous. At the base of the wall is Ferngirt rockwork, and in the corners there are Creepers on the roof, a cinnabar-coloured *Abutilon* being gorgeous with colour at the time of my visit. A large plant of *Medinilla magnifica* was also loaded with pink blossoms.

The second house is constructed in the same way as its fellow house, but is devoted to Tea Roses. It was impossible not to parody Coleridge's line, and exclaim, "Roses, Roses, everywhere." Roses hanging in wild *abandon* from the roof, Roses jealously entwining the pillars, Roses garlanding the arches, and Roses planted out, covering all the ground-floor. The effect of this large house of Roses was entrancingly lovely. The plants were in most robust health, without a sign of mildew, and covered with blooms. As in the garden of hybrid perpetuals, the Teas are planted out in this house in beds of one variety, and great taste has been shown in the grouping of the colours. Madame Lambard, which is the duchess' favourite colour, is perhaps the most grown, but any quantity almost of blooms of *Etoile de Lyon*, *Souvenir de Madame Pernet*, *Président*, *Souvenir d'un Ami*, and *Niphetos* could have been gathered. The house has been termed a "paradise of Roses"—it really deserves the name. A third house, not quite so large, is devoted to Camellias, which are also planted out. As these flowers are only gay for a small part of the year, Japanese Maples have been planted among them, and have a very enlivening effect. Round the house

is a staging for florists' flowers, occupied at the time of my visit by *Cinerarias*.

The other features of the grounds on this side, where they are most extensive, would be well worth detailed description, if space allowed. They chiefly consist of a series of avenues with broad grass walks between. The style is a little formal perhaps, but their great length always gives them an air of dignity in keeping with the place. The most striking of these avenues is a triple one, the back row are towering slender *Thuia gigantea*, the centre bushy Yews, and in front a row of dense dwarf golden *Retinospora obtusa*. These fine avenues are quite close to the three houses described above, but they are so sunken and hidden away that not a trace of them is visible.

No one should leave this orderly and magnificent estate without going to see the "The Winnings' Almshouses." They were built at the Duchess' request from the winnings of Ayrshire, Donovan, and Memoir. They made one envy the lot of the *employés*; no horticultural scribe foresees such a provision for his declining days. *Vagabond*.

THE HOME OF THE HOLLY FERN.

NOT being an ardent climber of mountain summits, it has long remained an unfulfilled wish to visit the Holly Fern (*Polystichum lonchitis*) in its native haunts, for although we have frequently been within eyeshot of the rugged hillsides which we knew it frequented, the one element of an experienced and congenial guide had always been lacking. Hence the fear of bogs, bad weather, or unlooked-for slips, had invariably "sicklied resolution o'er with the pale cast of thought," and confined ambition to lower levels. On July 1, however, of this year, fortune combined to vanquish every difficulty, as not only did the clerk of the weather smile most decidedly upon our plans, but no fewer than three congenial companions were to the fore, all familiar with the district. Among them was Mr. Donald Haggart, of Killin, an incomparable guide, as he not only knows every foot of Ben Lawers and his less lofty neighbours, but what is even more essential to true enjoyment of such a trip, he has a thorough acquaintance with the thousand and one gems of alpine vegetation which cover in a myriad forms the seemingly barren slopes as well as the rocky boulder-covered peaks, seamed with a thousand tiny cascades into which they gradually merge as the cairn-crowned summit is neared. Leaving Aberfeldy shortly before 8 o'clock, we drove along the lovely road leading thence to Kenmore, a name meaning literally the "big eed" of the lake. There, after getting a splendid view of Taymouth Castle, the home of the Breadalbanes, through a vista of matchless trees, the road suddenly turns to the right, and brings us into full view of Loch Tay stretching westward for some 15 miles, and bounded on either side by steeply sloping hills, backed up by the boldly swelling shoulders and sharper culminating peaks of such giants as Ben Lawers, Ben More, Ben Voirlich, and others of that ilk. To the right, the densely wooded Drummond Hill stretches for several miles along the loch, and forms an admirable contrast to the opposite heights which are almost treeless, bare green slopes only dotted here and there with farms and fields, mere oases of cultivation on deserts of moorland, and seamed with glens and watercourses, which in the distance look the merest wrinkles on the face of Nature. Following the lakeside road along the foot of Drummond Hill, we drive for miles under the shadow of its trees, through which we enjoy a constant series of glimpses of the silver surface of the loch. Here, as indeed all along the road, the stone dykes and shady slopes absolutely teem with Ferns, though the species, as compared with the southern counties, are few. The three predominating species are the Lady Fern (*Athyrium filix-femina*); the Male or common Buckler Fern in two of its forms (*Lastrea pseudo-mas* and *L. filix-mas*); and the lemon-scented Buckler Fern (*L. montana*). These

literally swarm in every sheltered spot, and as the result of two days' hunting in the district, we have added to our collection *L. montana truncata*, a curious variety in which the frond and all the pinnæ end abruptly with a small thorn protruding by way of finish; and *L. montana congesta*, a remarkably pretty variety, dwarfed to a quarter of the normal size. The truncate form, curiously enough, we found twice in spots nearly a mile apart, after a special hunt for it on the strength of a previous find of a frond partially affected on an otherwise normal plant, which led us to believe in the existence of the constant form in the locality, and thus to hunt specially for it. We are, however, off the track of the Holly Fern, in thus digressing. About 10 o'clock, after a slight shower, the sun came out brightly, and drove away every vestige of cloud, Ben Lawers himself deigning, after a suitable dignified delay, to divest himself of his nightcap just as we descended from our machine (Anglice dogcart) at the "Lawyer's Inn" at his foot. Putting up our horse here, and arranging for the due satisfaction of mountain appetites on our return, we sallied forth and began the ascent. Striking at first straight up the slope, we speedily reached a peat road of a very rough-and-tumble description, plentifully rutted with little streams, which we manfully ignored, the certainty of acquiring two shoes full of water per man before long, rendering us callous to the risk of wet feet. In a few minutes a brawling burn full of water from the heavy downpour of the previous night was crossed, and afforded a short spell of hunting among a dense fringe of *L. montana*, intermingled with the Hard Fern (*Blechnum spicant*) which covered its banks profusely at intervals. "Excelsior," however, was the constant cry of our guide, and leaving this hunting field, we speedily reached the grassy rushy moorland slopes above, where Ferns were conspicuous by their absence, the tiny Moonwort (*Botrychium lunaria*) alone rewarding our search.

Saxifrages, Sedums, various *Potentillas*, a *Geatian*, and an infinite diversity of grasses, rushes, sedges, mosses, and lichens now covered the ground, or rather formed it, to an indefinite depth, building up in their decay the very peat upon the surface of which, coral fashion, they were throwing and forming their colonies, alternately bathed in cloud mists and sunbeams, which can be seen from a distance sweeping, billow-like, over hill and vale. Here and there among the coral-like Lycopods and Staghorn mosses various species of sphagnum do their best to ape the sponges. Here is a dense ruddy hemispherical moss, dotted here and there with the pretty but horrible little Sundew (*Drosera rotundifolia*), side by side with its equally murderous insect-devourer, *Pinguicula vulgaris* throwing up its innocent-looking violet flowers from a cluster of leaves which apes the star fishes. Yonder, another member of the sphagnum family forms for some yards an emerald-green carpet of enticing softness, of which a warning cry from our guide bids us beware, for this is a trap of a larger sort, and woe to the human fly who puts his foot upon its treacherous surface, which covers a bughole of unknown depth and unlimited swallowing powers, and for all its apparent verdancy, is capable of "taking in even the canniest in all Scotland," which is saying a great deal for it.

Avoiding the snare, however, and following our guide, who punctuates every anecdote with a (to us) new discovery at his feet, we gradually approach the 2000 feet level, and here we are told to look out for the first true alpine Fern, viz., *Polypodium alpestre*. Scarcely a dozen yards further we espy a fine little bunch of plants under the lee of a big boulder by the side of a small stream we are skirting, a Lady Fern to all appearance, but somewhat more soft and succulent in texture. The lens, too, reveals speedily the naked sporeheaps, which, botanically, rank it with the Polypodies, despite its undoubtedly stronger claims to kinship with the *Athyrium*. More and more we found as we proceeded, its presence always being determined by that of loose lying boulders, under the shelter of which the plants could nestle.

A few hundred yards further, and we found ourselves on a slight declivity, leading down to a shallow

tarn or loch, which lies in the midst of a bold amphitheatre formed by the topmost ridges of Ben Lawers, whose cairn-crowned summit rose some 1500 feet to our right. The cliffs and slopes were sparkling with long tortuous lines of snowy cascades,

for the species was over, and that our special search for varieties was beginning. Most of the plants were fairly hidden in deep crevices, due, we imagine, to partial depletion by visitors, as, later on in our search, in less accessible spots, we found it growing

was bagged, forming, with the normal, a very fair quartette, considering the reputed constancy of the species. The Holly Fern here was accompanied by a profusion of small plants of the Hard Fern (*Blechnum spicant*), the Broad Buckler Fern (*Lastrea dilatata*), in a very lax and delicate condition; *L. montana*, very small; and here and there a diminutive *L. filix-mas*. All these species were obviously very near the border of their possible existence. *Polypodium alpestre*, the Oak Fern (*P. dryopteris*), the Beech Fern (*P. phegopteris*), and the brittle Bladder Fern (*Cystopteris fragilis*) were, however, quite at home, while two plants of *Woodsia ilvensis* were unexpectedly found among the rocks, instead of in the steep cliffs to which it was supposed to be confined, but on which it could not be discovered after long search. The green Spleenwort (*Asplenium viride*) literally swarmed in every chink, and even in the grass close to the rocks.

From the position and conditions in and under which the Holly Fern was thriving in this habitat, it is clear that the essentials for its cultivation are constant moisture at the roots and thorough protection of the crown from the sun. In all cases we found the crown well away from the light, and the deeper the chink the better. The roots were generally embedded in a loose mass of rock debris and vegetable mould of a peaty character—a compost implying perfect drainage. The climatal conditions at this high level imply constant aerial humidity, as almost every passing cloud means a Scotch mist of a more or less drenching character. In the drier counties of Great Britain, therefore, it is obvious that a sheltered moist position must be selected, and in our own experience we have found a close frame facing the north to suit it admirably, while if planted in the open and left to itself, a dry spell was apt to be fatal even to well-established plants. As the species has afforded very few decided varieties as compared with the two other indigenous species of *Polystichum* (*P. aculeatum* and *P. angulare*), which have yielded an extraordinary large number of forms, our short experience leads us to surmise that this is largely due to its much greater inaccessibility and consequent immunity from examination by varietal experts. Among the plants we secured there were very distinct departures from the recognised normal type, and even that type was nearly equally divided into two forms, one distinctly spiny and Holly-like and the other smooth-edged, the spines being quite rudimentary except at the apices of the pinnae. A crested form has been found on Ben Qui by Dr. Craig.

A subsequent search on the hills nearer Aberfeldy, resulted in the discovery of a fair number of Holly Ferns at a level of under 2000 feet in a habitat, otherwise of similar character to that of Ben Lawers and here, curiously enough, we found two plants of the Moonwort (*Botrychium lunaria*) growing on a narrow ledge of a perpendicular cliff where we expected to find *Woodsia ilvensis*.

On our return journey southwards, we were fortunate enough to find in Strathblane a very distinct and beautiful new form of Lady Fern (*Athyrium filix-femina revolvens*), in which the apices of frond and pinnae are curved backwards into semi-circles, the pinnae well rounded, and the pinnules convex. It is certainly one of the most graceful types we have seen. *Charles T. Drury, F.L.S., Fernholme, Forest Gate.*

FIG. 27.—EUCRYPHIA PINNATIFOLIA, HARDY SHRUB: FLOWERS WHITE, STAMENS YELLOW.

rashing down to feed the lake, upon the hither side of which, among a myriad huge rocks which were heaped up around its margin, we found the home of the Holly Fern. Immediately we came within eye-shot, a plant here and another there, peeping out of the chinks and crevices, announced that our search

openly in the grass; full-grown plants, too, were very rare, only one, with 18-inch fronds, coming under our notice. Not long had we searched when a very promising seedling, with distinctly confluent pinnae, was observed. A densely imbricate form next attracted notice, and finally a very spiny foliage type

TREES AND SHRUBS.

EUCRYPHIA PINNATIFOLIA.

A FEW weeks ago some one was inquiring if this shrub was still in cultivation, and if it was hardy enough to flourish in this country. So far as I know, it has not been lost to cultivation since it was first introduced by the Messrs. Veitch from South Chili, some fifteen years ago, and has since become slowly distributed throughout most of the good gardens in England and Ireland, and parts of Scotland. Evidence of its perfect hardiness and adaptability to our

climate is afforded by the flourishing specimens in the Coombe Wood nursery in Surrey, where the shrub is at present in flower, and very beautiful it is with its great white blossoms, reminding one of St. John's Wort (*Hypericum calycinum*) in their form, though not so large. It is a deciduous bush, some 4 or 5 feet high at Coombe, but grows taller in Chili. The leaves are pinnate, and of a very deep glossy green. The flowers are produced in clusters on the upper parts of the young shoots, and their snowy whiteness, with the feathery tuft of yellow-tipped stamens, is very striking (see fig. 27). It lasts a long time in flower, and as it blooms at this season, when so few other hardy shrubs do, it is the more valuable in the garden. At Coombe, it is fully exposed, and has withstood quite unprotected many severe winters, and even the last did not affect it in the least. It is a beautiful shrub to have in one's garden, and quite out of the ordinary run. *W. G.*

DAPHNE CNEORUM.

Daphnes are plants well fitted for decorating the conservatory, shrubbery, or rockery of any garden; the indica section are specially valued on account of their delicious odour, combined with the brightness and usefulness of their flowers, either in a cut state or remaining on the plants, lasting in perfection a considerable time. *D. Cneorum* is one of the most pleasing and desirable of small trailing hardy shrubs we have; it is particularly adapted to serve as an edging to taller-growing plants, just before the Azaleas, Rhododendrons, and *Cytisus* burst into bloom—a time when there is a dearth of showy-coloured flowers. A very important point is drainage: if this is neglected, and the plants kept in a very damp situation, it will be almost impossible for them to thrive. They delight in a moist soil, but on no account should the water become stagnant at the roots. The soil which favours it best is of a peaty nature, mixed with well-decayed leaf-mould, but it does tolerably well with loam and peat. Another purpose for which it is suited is forcing, for with but very little coaxing it can be had in bloom at the end of February. For this purpose they should be grown in pots, and kept plunged outside all through the summer, freely supplied with water, especially about the foliage; and liquid-manure given to the roots occasionally will greatly add to the strength of the plants. Very little heat is necessary to have them in bloom by the time stated, and one advantage it enjoys over some plants that are forced, they will keep a long time in full beauty, and can be used either for button-holes, bouquets, or table-decorations. The flowers are borne in terminal clusters on almost every shoot, the colour being of a rich rosy-pink, and delightfully scented. It rarely exceeds 9 inches to 1 foot in height, and is best propagated by division, which should be done in spring, or by layering; for the latter, all that is necessary is to cut the shoots on the underside and press a little light soil into the cut, and then with a peg make it fast in the soil, and water occasionally.

LEIOPHYLLUM BUXIFOLIUM.

Although this ericaceous plant has been in cultivation since 1735, it is very rarely met with in gardens. It is occasionally found under the name of *Ledum myrtifolium*, or more popularly as the Sand Myrtle. It is one of the best shrubs that can be found for an edging to small borders or beds, being very seldom more than 1 foot to 15 inches high, and as it is of slow growth it can be used for this purpose for years without the necessity of pulling up the plants. The foliage is neat, being of a dark-green colour, and much resembling a small-leaved Box, hence the name *buxifolium*. It is in every respect a neat free-flowering Evergreen, but to a great extent has been overlooked by planters; it looks well associated with *Rhododendron hirsutum* or *Kalmia angustifolia*. *Rhododendrons* blooming a week or two later than *Leiophyllums*, the bed is kept a pretty show of flowers for about six weeks. As a rock plant it is quite at home, it yields a supply of pretty flowers in May and June, and like *Daphne Cneorum* the flowers keep a long time in full beauty; the

flowers, which are borne in dense terminal clusters, are tinged with pink in the bud state, but when fully expanded they are almost white. It grows wild on the mountains of Virginia and New Jersey; it is rather difficult to increase the stock by cuttings, as they do not root freely. In August, young shoots that are thoroughly ripened should be taken with a heel of old wood, removing the bottom leaves; they should then be placed in clean cutting pots, with drainage half-way up, the soil being good peat and coarse silver sand, and then stood on ashes in cold frames, and providing each pot with a bell-glass, which must be wiped out at least every other morning, care being taken to have them shaded from the sun. When a callus is formed, they may be removed to a house with a temperature of 55°, which will greatly assist root formation. It is propagated more extensively by layers, and whenever seeds are procurable they should be sown as soon as possible in soil similar to that recommended for the cuttings, and the pots placed in gentle heat. *H.*

PLANTS FOR SHADED PLACES BELOW TREES.

The St. John's Wort, *Hypericum calycinum*, is indigenous to Scotland and Ireland, where it seems to thrive best and reproduce itself with the greatest of freedom on dry banks and bushy places along the margins of woods and fields, and seems perfectly at home under the shade of trees. As it is a hardy native shrub, it is highly suitable for planting on bare shady places under trees, where it is desirable to establish a covert and improve the scenic beauty of the spot. The plants to be used had better be prepared in a home nursery or elsewhere, by transplanting them several times in order to promote the formation of bushy roots, which is a matter of much importance as a means of attaining success when they are planted out where they are to remain. The spots where the plants are to be inserted should be broken up with a pick, and a little fresh soil added, which will prove beneficial in promoting their growth at the start. The plants may be successfully planted out any time during fresh genial weather, after they have matured their growth in autumn. The common Irish Ivy (*Hedera helix*), and the Periwinkle (*Vinca minor* and *V. major*), are likewise suitable, and may be treated in a similar way. In a mixed plantation in the Lough Neagh district of Ireland, some of the sedge tribe of plants make capital covert below the trees, namely, *Carex divisa* and *C. divulsa*; these are growing in dense masses, and sometimes in isolated patches, and in many cases they are quite at home on decayed roots and stumps of old trees. In one case, I find the Spurge Laurel (*Daphne laureola*) growing and reproducing itself from seed at the base of a Scotch Fir tree. The trees in this plantation consist principally of Oak, Ash, Beech, Birch, and Scotch Fir. The common tree Box, Butcher's Broom, and Cotoneasters of sorts do tolerably well in such places, and are worthy of a trial. In the natural forests in the Highlands of Scotland, the Whortleberry (*Vaccinium Vitis Idæa*) forms fine close covert under the shade of the Scotch Fir, Birch, Willow, Aspen, and Poplar, and in some places the Blueberry (*V. myrtillus*) is also conspicuous. In many parts the common Juniper (*J. communis*) forms the best of covert, and is utilised for shelter by the roe-deer and woodcock during a gale. This Juniper, being a hardy native shrub, reproduces itself from seed on the spot; but in cases where it is desirable to extend its culture, its seeds or berries when ripe may be sown in the chinks of rocks and elsewhere in the recesses of the hills, and covered with a small quantity of soil. As the Juniper is not apt to be eaten by hares and rabbits, and affords good shelter, it is one of our best covert plants. On bare rocky places the hard Fern (*Blechnum boreale*) seems quite at home, and never fails to impart a lively furnished appearance to the spot. On damp boggy places along the margins of lakes and rivers, the Royal Fern (*Osmunda regalis*) thrives very well under the shade of trees, and makes excellent covert, and in Ireland it reproduces itself from spores on the spot with facility. When the extension of this Fern

is desirable, young seedling plants should be dug up with a little mossy soil attached to their roots, which will promote their growth and success when planted in their new quarters. Several of our hardy native grasses make excellent covert under trees, such as Cocksfoot-grass (*Dactylis glomerata*), Wood Meadow-grass (*Poa nemoralis*), Rough-stalked Meadow-grass (*P. trivialis*), Yorkshire Fog (*Holcus mollis* and *H. lanatus*), all of which, and others, may be raised from seed on the spot where they are to remain. *J. B. Webster.*

CHISWICK NOTES.

GRAPE DUKE OF BUCKLEUCH.—How seldom do we see this undeniably handsome Grape well done! It is subject, for some unknown reason, to "spottiness" in the berries. We, however, noted some good bunches, minus this objectionable character, at Chiswick lately. The Duke has tender flesh, with a sprightly Hamburg flavour.

MADRESFIELD COURT.

Another most valuable Grape with a complaint (that of cracking), is Black Muscat. At Chiswick it is free from this blemish. Its very large oval berries, of high Muscat flavour, present a handsome appearance.

GODETIAS.

Some beds of Godetias are just now very striking at Chiswick, giving quite a glare of colour. Note-worthy sorts are: Duke of Fife, reddish crimson; and Duchess of Fife, blush, with large carmine blotches (fine), both newish forms. *Bocconia japonica* stands out in the herbaceous border, with its large glaucous sinuate foliage, and a profusion of small whitish flowers in panicles.

BEGONIAS.

We noticed a few beds of these in various colours at Chiswick recently, just coming nicely into flower, and labelled as coming from one of the homes of the Begonia—Swanley to wit. For such purposes as hedging, these beautiful flowers are slowly but, nevertheless, surely coming into favour. They seem to stand better such weather as we have been experiencing of late, and have a longer period of flowering than the once (and still in places) popular Pelargonium.

CHRYSANTHEMUMS.

Two good annual varieties recently noted at Chiswick are *C. Sibthorpi*, bright golden-yellow, very free-flowering, and therefore most useful for cutting purposes; and *C. mulicaule* var. *aurea*, a very useful dwarf form, yellow.

PREPARATION OF SOIL FOR FRUIT CULTURE.*

THE nature and condition of the soil is of the greatest possible importance in relation to fruit culture, as the soil is the principal medium through which the building-up of the tree and the formation of fruit takes place. The soil serves not only as a basis upon which the tree fixes itself and maintains its position, but it is the medium through which it draws its food supply, as well as that wherein many of the chemical changes take place in the preparation of the various elements of plant-food.

Before determining what preparation may be required, it will be needful to ascertain the present condition of the soil. To do this, in the first place the natural condition or strength of the land must be ascertained; that is, what are its component parts, how much does it contain of the elements of the food required, or what ingredients may be deficient. A chemical analysis is the only means of ascertaining this accurately, but where only small quantities of trees are to be planted by a cottager, allotment-holder, or small farmer, this might entail too great an expense, but a fairly accurate estimate of the quality of various soils may be formed by any prac-

* Read by Mr. Joseph Cheal at the British Fruit Growers' Association's Beddington Park Conference, August 2, 1891.

tical man, and the elements that are likely to be deficient may be artificially supplied.

But the object of this paper is not to deal with the composition of soils, so much as to give a few practical hints as to the cultivation required to render the land fit for planting.

The present state of the land to be planted must first be considered. As to whether it is freshly broken-up pasture, whether ordinary arable land, or whether it may have received any better treatment than that given in ordinary husbandry. The first consideration should be that of drainage. Nothing can be worse for fruit trees than to be planted in land, the subsoil of which is close and water-logged. There are of course many soils that do not require draining. A test as to its nature in this respect may be made in the following way:—If, on digging to the subsoil, you find it porous and perforated by worms, you may conclude that there is sufficient circulation of water and air through it. If, on the contrary, you find the soil close and retentive with no worm-holes, you may conclude that it ought to be drained; and let me here emphasise the importance of proper drainage. If the land be water-logged, it is impossible for the trees to thrive and maintain a healthy condition upon it, or for it to perform its proper functions in preparing plant-food. The fruit trees will consequently become moss covered and subject to canker, and many other diseases, and instead of producing good profitable crops, will become so stunted and unhealthy, that what fruit may be produced will be comparatively worthless.

The next consideration is the breaking up of the land. If it has been used for ordinary husbandry, it should, in the first place, be broken up to a greater depth than has hitherto been the case. Where there is no great extent to be planted, this would probably have to be performed by hand. This should be done by what is ordinarily known as bastard trenching, or the breaking-up of the land two spits deep, but in doing this, on no account must the subsoil be brought to the surface, but merely broken up and turned over, turning the next spit of surface-soil on to the top of the subsoil thus broken up.

Where large breadths are to be prepared, a steam cultivator may be used to advantage, or it may also be prepared with the subsoil plough. These implements should be used in dry weather only, and, if possible, used in two opposite directions, to ensure the whole of the subsoil being moved. If the land can be thus prepared a few months before planting, so much the better, as the constant moving of the land in dry weather, and fully exposing it to the action of the sun and air, is highly beneficial, and it enables the soil to absorb from the atmosphere many fertilising elements.

In the case of planting standard trees upon grass-land in the old style of farm orchards, it will be needful to dig holes for each of the trees. In these single holes, however, there is always a great danger of water lodging and becoming stagnant, which will be greatly to the detriment of the tree. Where, therefore, it becomes necessary to dig these single holes, always be careful to provide some proper means of drainage from each hole, or disappointment will probably ensue to the planter.

As to the condition of the land best suited to planting, probably that from which a root-crop has been taken will be found one of the best. The land will then of necessity have been well worked in preparation for the roots, and well-manured, much of the strength of which will still remain in the soil in the best condition for the newly-forming roots to feed upon. If planting is to succeed a corn crop, the land will be in a more exhausted condition, and will require more manure applying at the time of planting.

It is most desirable to select land that is clean and free from weeds. Otherwise, if the trees are planted where the land is at all encumbered with them, and they should become buried amongst the roots of the trees, great annoyance and expense will ensue for many years, and some of the more tenacious weeds

cannot be afterwards extracted without injury to the roots of the tree.

If the land to be planted is naturally good, and has been well cultivated for any considerable time, it will not require much cultivation before planting; but if the land is not naturally so good, and is in a poor condition, it will be better to defer planting for a time, in order to thoroughly clean and give good preparation. In some cases it will pay well to take a clear summer fallow, and to break up the land, and thoroughly clean and pulverise it through the summer, applying a good coat of manure in the autumn before planting. This will really be no loss of time, but a saving in the end, and the endeavour in planting should always be to put the tree into the soil under such conditions that it will have a fair opportunity of growing and thriving after it is planted.

WALNUTS.

THE Walnut season is approaching, and a few remarks on their consumption in various countries may not be out of place. When about half or three parts grown, the Walnut is used for pickling. There are many varieties of these Nuts, such as the oval, round, double, large and small-fruited, early and late, tender thin-shelled, and hard thick-shelled. An almost huskless variety occurs in the north of China. Walnuts always command a ready sale at market in large towns, where, at their first coming in, in September, they are brought in their husks and sold by the sack or bushel; but afterwards, cleared of the outer husk, they are sold both by measure and by the thousand. The larger portion of the Walnuts consumed in England are of foreign growth, and average in quantity about 250,000 bushels. The bulk of these come from France and Belgium, and small quantities from Germany, Holland, and Italy.

The aggregate exports from Bordeaux are about 65,000 cwt. yearly. Small quantities find their way from Chili to Europe. Walnuts are a notable production of Périgord, in France, the annual produce there being estimated at £40,000 in value. The best, which are large, and called "Marrons," come from the canton of Luc, in Provence. To obtain first-class fruit, the tree is grafted in France.

The culture of the common Walnut (*Juglans regia*) is diffused all over Italy, from the Alpine to the Sicilian valleys; however, the number of these trees has lately somewhat diminished, on account of the incessant demand for its timber, which is much used in carpentry—but in general, the tree is more valued on account of its fruit. When the nuts are fully ripe, which is in September and October, the kernel, deprived of its investing skin, is eaten in great quantities. As long as the skin can be easily removed, they are a nutritious and healthy article of diet, but when they get dry, so that the adhering skin sticks to them, they become indigestible.

Walnuts in the shell yield about one-third their weight of picked kernels, which are the crumpled cotyledons, or seed-leaves. In some northern districts, particularly in Piedmont, the Walnut tree has always been held in great estimation for the production of oil, which, when newly made, has a very agreeable taste, and can be employed in cookery, as well as in the preparation of varnish. The Canadian Walnut, although double the size of the English Walnut, contains a much smaller kernel, with a different flavour, being strong and slightly pungent. The seeds of the black Walnut of North America (*J. nigra*) are more oily than those of the European Walnut. A large tree will yield 15 to 20 bushels in a season, selling at 4s. a bushel.

The Butter-nut, or grey Walnut, of America (*J. cinerea*) has a taste similar to the Brazil-nut. The kernel of *J. Sieboldiana* of Japan has a taste like the Butter-nut, but less oily, and the shell is not so thick as that of the black Walnut.

The nuts of *J. Mandschurica*, allied to *J. cinerea*, are also available for the table. The kernels of the

Butter-nut in former times were pounded by the Indians of North America and boiled; this operation separated the oily substance, and was used by them as we use butter, hence its common name. The Persian Walnut is about a third, or a half, larger than the English Walnut; of an elongated shape, with very rich meat or kernel, and the shell as thin as paper. It is not an unusual thing for a tree eight to twelve years old to bear 30,000 nuts, or 12,000 lb. There are four kinds, the kanate, the wanter, the denu, and the kagkazi, the last of which is the finest nut grown. The Walnut grows abundantly in Kashmir, Nepal, and other parts of India, where the fruits are largely used. It forms also an important article of consumption in Japan, quantities being eaten in a raw state. They are also much used there for making a kind of confection, by cracking and removing the shell, without hurting the kernel, which is afterwards coated with white sugar, thus making an attractive and agreeable sweetmeat.

The Walnut also furnishes there a bland oil, used for domestic purposes. In China it seems to be specially pressed for oil, as in some years over 12,000 tons of Walnut pulp are exported from the port of Tientsin in the year. The Walnut is extensively cultivated in the Punjab, Himalaya, and Afghanistan, a large annual supply being brought to the plains of India by the Kaouli and other traders from the hills. The nut ripens there from July to September. There are several well-known forms of this nut met with, the soft-shelled kind from Kashmir and Chamba being regarded as the best. A bushel of Walnuts will yield fifteen pounds of peeled kernels, and these will produce half that weight of oil.

The Hickory-nuts (*Carya alba*) are very generally eaten in the United States, and highly esteemed. It is a fine nut, peculiarly shaped, encased in a thin but strong shell. The kernel in flavour and formation resembles pretty closely that of the English Walnut. The nuts of *C. microcarpa*, closely related to *C. alba*, is of pleasant taste, but smaller. Those of another species, the shell-bark Hickory (*C. amara*), are thin-shelled, and, being exceedingly bitter, are not eatable. The nut of *C. sulcata* is of a sweet pleasant taste. The Mocker-nut (*C. tomentosa*) is small but sweet and very oily. A variety produces nuts as large as a small Apple, which are called King-nuts. The Peccan-nut (*C. oliviformis*) is considered a delicacy superior to the common Walnut. It breaks easily, and has a nut entirely free from divisions. The nuts keep long, and do not turn rancid, and are exported to the West Indies. Texas annually exports these nuts to the value of over £10,000. The Peccan begins to bear at about ten years, and the yield annually increases in quantity until the full growth of the tree is attained. *P. L. Simmonds, F.L.S.*

COLONIAL NOTES.

CHRYSANTHEMUMS IN NEW ZEALAND.

IN reading the *Gardeners' Chronicle* out here, we are able to observe that the rage for these showy flowers still exists, and we, out here, are always on the look-out for new varieties, which of late have been somewhat numerous. These flowers may be said to have fairly "caught on" the colonials, who are now devoting a large amount of attention to their cultivation. Our annual show of the Horticultural Society was held on May 7 and 8, at Christchurch, Canterbury, and it surpassed all its previous exhibitions, both in cut blooms and pot plants. The classes were more numerous, and the number of exhibitors was far in excess of previous years. The attendance of the public was uncomfortably great to be pleasant, the hall being crowded each day, thus showing that the love for these flowers is on the increase. Of course there was a class for the "largest bloom," some of which (*Japs*) measured 10 inches in diameter, and

the incurved were remarkably good. Amongst the varieties of recent introduction we noticed:—

Incurved.—Charles Gibson, Emily Dale, Alfred Lyne, Lady Dorothy, Lord Eversley, Violet Tomlin, Miss M. A. Haggas, and many others.

Japanese.—Charles Dixon, Condar, Lillian E. Bird, Chasta, Sunflower, Anna M. Payne, Avalanche, Etoile de Lyon, Eynsford White, Gloriosum, George Daniels, Mrs. Andrew Carnegie, Mrs. J. Wright, Meg Merrilies, Mons. W. Holmes, Onward, Standstead Surprise, Mr. Ralph Brocklebank, L'Ebouriffé, Mrs. E. W. Clark, Mrs. Falconer Jameson, Moonlight, Mrs. Alpheus Hardy, Tokio, Fair Maid of Guernsey, Mons. Juan Cruz de Eguileor, and many other varieties, too numerous to note.

Reflected.—Dr. Sharpe, Garibaldi, King of Crimsons, Mrs. Forsyth, Annie Salter, Chevalier Domage, Elsie, Golden Christine, Amy Furze, Cullingfordi, Putney George, Sœur Melaine, Cloth of Gold, Talford Salter, and others.

Pompon.—Lady Margaret, Perle, George Sand, Marie Stuart, Gluck, Fleur de Marie, Mr. Astie, Queen of Anemones, Calliope, Antonius, Marabout, Sœur Dorothée Souille, Sunflower. This class does not appear to come well to the front, although they are so well adapted for cutting. It is the Japs that seem to be most sought after, and one grower that I am acquainted with is now growing upwards of one hundred varieties of this class.

The pot culture is not carried out on a very large scale, possibly owing to the high price of the pots and the extra attention that they require during the growing season. *W. A. C. Sumner, Canterbury, N.Z., May 20, 1891.*

THE EFFECTS OF THE LAST WINTER'S FROST ON THE FRENCH AND ITALIAN ESSENTIAL OIL CROPS.

ILLUSTRATIONS of the damage done by the severity of the late winter continue to crop up in various directions. Thus, we learn from the *Chemist and Druggist* that the plants cultivated in Italy and the South of France for the yield of essential oils have suffered so severely as to considerably impair the market supplies. Reports from Italy state that oil of Bergamot is exceedingly scarce, and realising higher prices after every transaction. The principal plants cultivated in France for these essential oils, which are said to have been so much damaged by last winter's frosts, are Thyme, Rosemary, Lavender, and Pennyroyal. News from Spain also state that the output of Geranium oil will this year be a very small one, in consequence of the plantations having suffered greatly from frost.

With regard to English oil plants cultivated at Mitcham, a considerable acreage of the Peppermint crops is said to have been winter damaged, especially on the heavy damp soils and on the more exposed positions, so that some of the plants were taken up. Lavender, also, has suffered severely, especially the old plants, of which the frosts have apparently made short work, nearly all being killed. With regard to the young plants, it is yet too early to speak. During the closing week or ten days of April, the price of the oil advanced from about 35s. to 40s. per lb. The Camomile plants have also suffered from the severe weather, and wire-worm made its appearance amongst the roots to a considerable extent.

In connection with the subject of essential oils it may be stated that the trade report for the week ending May 2, states that the first consignment of Cassia pomade shipped from British India was recently received in London. It was only a sample shipment, but if successful, it may be the precursor of large quantities, as the flowers (*Acacia Farnesiana*) are found growing wild in abundance. It is claimed for the Indian pomade that it is very considerably stronger than the strongest French.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

PEAS.—Should dry weather occur, see that the advancing rows of Peas do not suffer for want of water, especially those coming into bloom; and in applying water to the soil, see that the rows are thoroughly soaked. Those coming into bearing should be supplied with liquid manure, and on light soils heavily mulched; and to keep them in bearing as long as possible, the pods should be kept picked off. Should mildew make its appearance, as it frequently does at this time of year, the plants should be dusted over with sulphur while moist with dew in the early morning, avoiding the pods as much as possible.

CAULIFLOWERS, such as Veitch's Autumn Giant and the Autumn Mammoth varieties, are now forming their flower-heads; the whole beds should therefore be carefully gone over, and the most forward have their leaves gathered together and tied with matting, to protect the heads from being discoloured by the sun: if mulched with partly-decayed manure, the soil will be kept moist and cool, and the plants assisted in developing fine solid white heads. Where the soil is light they should be afforded frequent waterings of sewage or liquid manure, otherwise the heads will be small and ill-shaped.

Sowings of the various kinds of Cauliflowers to be wintered in cold frames should now be made for planting out next spring. I find a south border the best place for making these sowings; the border should be well dug and dressed with soot, but avoid using strong manures unless the ground is very poor, or the plants would make too strong growth, whilst they are at all times liable to form button-heads soon after they are planted out in spring, and often even before they are planted out, thus causing much disappointment. The various sorts should be sown in beds by themselves, and carefully labelled. The soil should be made moderately firm by treading the beds over with the feet before sowing the seed; this has the effect of producing more fibrous roots than when sown in loose soils. Loss of seeds by the birds is best prevented by putting nets over the beds, resting on forked stakes about a foot above the surface. When the plants are large enough, they should be pricked off into their winter quarters at 6 inches apart, and when established, should be fully exposed at all times, only putting the lights on to protect them from heavy rains or severe weather. In case the first lot raised should get too forward, it is advisable to make a second sowing, at an interval of about ten or twelve days. Whatever may be said in favour of raising Cauliflower plants from seed sown in heat in January, I still follow the old practice of raising a good stock of plants at this season of the year for wintering in cold frames or handlights. Plants thus treated, if they are not deprived of air in fine weather, and not covered up except in very hard seasons, seldom fail to bring fine heads in the first or second week in June. Walcheren, Early London, and King of the Cauliflowers, are three good varieties for sowing at this time. Magnum Bonum, First Crop, and Snowball are not suitable for sowing now; they are so apt to button before they are planted out, but are very valuable for early spring sowing. Where it is intended to winter the plants under handlights, these should stand on beds, 4 feet wide, and the handlights formed in line down each bed at 3 feet apart. In the spring, all the plants but three in each may be planted elsewhere, those remaining will form the earliest heads. *C. J. Waite, Glenhurst, Essex.*

THE HARDY FRUIT GARDEN.

RASPBERRIES.—These, as with many of our useful fruits, are not infrequently left growing on the same plot of ground for a number of years, and annually coated with rich manure till the ground becomes as it were "sick," while the crops of fruit are miserably poor. In all such cases I would urge that a change of crop be made, and if the ground to be planted is now at liberty, to lose no time in getting it in readiness for the reception of the canes in October. Land well drained, or that which rests on a gravelly subsoil, may be left for a few weeks longer, and then it should be trenched and well manured. But in the case of heavy soils, preparations should at once be commenced by deeply trenching. There is no necessity to bring the bottom spit to the top, but it should be thoroughly turned up and broken.

Heavy soils will be greatly benefited by working in with the soil, as the trenching is being done, abundance of road-scrappings, leaf-mould, or spent Mushroom-beds, burnt earth, potting-bench refuse, &c. If done at once, in about five weeks' time it should again be thoroughly stirred. Ground well prepared will produce good Raspberries for several years. Planting may be done in a variety of ways, each of which may have something special to recommend them. Trained on wires, and planted in rows 6 feet apart, answers well, but the method usually adopted by market growers is to plant at about 5 feet in clumps of threes, triangular, 12 inches from cane to cane; these are never staked, but shortened back to 4 feet in spring, and the results are very satisfactory. It must also be borne in mind that the Raspberry is a surface-rooter, and in consequence the soil for at least 1 foot deep should be reasonably porous and good. Newly-made plantations should not be allowed to fruit the first year, but the canes should be cut down to within a few inches of the ground-level so soon as growth commences in spring. All fruitful stools should now be gone over, cutting out the canes which have fruited, making room for those intended to bear next year, plenty of light and air to ripen the wood being greatly needed this season.

STRAWBERRIES.—All planting to be done should be completed at once, or the crops of next year will be poor. Runners rooted on turves or in 60-pots should fruit well next year, if got out at once on deeply-tilled ground and made firm, but this should be regulated according to the nature of the soil. It is almost impossible to over-consolidate light land, but that which is heavy should be very sparingly trodden upon, especially in wet weather. Give the final trim to all late sorts cleared of fruit, so that each may produce good fruitful crowns by the end of the season, and in making new plantations, only plant those good and useful, in preference to growing numerous varieties. *H. Markham, Mereworth Castle, Maidstone.*

PLANTS UNDER GLASS.

AMARYLLISES.—Plants of these that bloom first, will have completed their growths some few weeks since, and the leaves will now be showing signs of decay; but so long as they have any signs of life in them, the soil must not be allowed to get so dry as to hasten their dying off, as anything which destroys the vitality of the foliage before its natural time always tends to weaken the bulbs, and will also affect the next year's bloom. It may often be seen that Amaryllis, and also other bulbs, do not receive a like amount of attention after they have done flowering to that which is given them previous to blooming, especially in the matter of keeping them free from red-spider and thrips. The most effectual remedy for these pests is to dip the leaves in a solution of Gishurst's Compound. If the syringe is used freely during the summer, so that the water reaches both sides of the foliage, it is very seldom that these pests will give much trouble. When these plants are allowed to come on with little more than sun-heat, the plants after blooming may be placed in a cold frame to complete their growth, and there is less danger from the attack of red-spider and thrips than there was early in the summer.

WINTER-FLOWERING CARNATIONS.—Plants which have been grown in the open ground during the summer should now be potted; it is a mistake to leave the potting until later on, because Carnations do not care for too much fire-heat, and when the lifting is deferred until the growing season is over, the roots are not able to make the progress necessary to enable the plants to bloom well. Use great care in lifting the plants, so as to secure as many of the roots as possible without damaging them. The size of the pots must be determined upon by the size of the plants, as it is advisable to retain as much of the soil intact as possible around the roots. When the plants are potted, stand them in a pit so as to encourage the plants to make fresh roots, keeping them rather close for several weeks till they get established, when air should be given freely in the daytime. After potting, be careful not to give water until the plants require it, as Carnations at all times are very impatient at having their roots kept too moist.

FUCHSIAS.—The soil in which plants have been kept stopped back have been growing in, will be impoverished, and will require assistance in the way of weak manure-water, as Fuchsias will not bear

it so strong as most soft-wooded subjects, and where concentrated fertilisers are used, the same care should also be taken. Cuttings which were inserted some time back will now be ready for potting into 5-inch pots, they will make useful plants for blooming early next spring. Good loam, rotten manure, leaf-soil, and sand will be found a suitable compost for them. Grow them in a pit close to the glass in an intermediate temperature, and syringe freely to keep down spiders. Plants which are struck during the summer and kept growing slowly through the autumn and winter, bloom much earlier in the season than cuttings which are struck early in the year. *R. Milner, Penrice Castle, Swansea.*

THE ORCHID HOUSES.

THE EAST INDIAN HOUSE.—Although this is not the season in which one usually expects to find a large show of flowers in the warmest houses, still, there are a goodly number of things of great beauty that come in now. Foremost amongst these must be placed *Cattleya Dowiana* and its congener, *C. D. aurea*; these plants never fail in commanding the attention of visitors who are not orchidists. Another most useful plant, and one, too, that is sufficiently cheap for any amateur to buy, is *Saccolabium Blumei majus*; it is one of, if not really the best grower, of the whole genus. They do well when planted either in pots or baskets, and grown in the warmest and shadiest part of the house; plenty of moisture must be kept about the plants during the growing season, which is from February to November—during the winter no water should be given unless the bottom leaves begin to feel limp to the touch. *Oncidium Kramerii* is a most useful plant for summer flowering, commencing to send out its flowers in the month of May; the plants, when strong, will continue flowering until late in the autumn. These plants will be found to flourish in about three parts peat to one of sphagnum moss, and potted very firmly; the pots should be as small as it is possible to get the roots into, pinching of the roots of this plant making a material difference in its growth. *Paphiopsis grandis* is nearly always in flower, and almost earns the name of being a perpetual flowerer. I find the plant does well when planted in baskets in peat, sphagnum moss, and broken potsherds intermixed; the roots, which grow very fast, soon adhere to the hard substances in the potting compost, the plants growing very fast. The flowers are sent out from the base of the pseudobulb usually in pairs; they last about a week in perfection. *Epidendrum dichromum amabile* is now flowering; this plant has been given up years ago in despair, as being such a bad doer. Whether the plants that have been introduced during the last few years are from the same locality I know not, but they are certainly better grown now than formerly, it being nothing unusual to find it blooming freely now. *Cologyne Massangeana* is blooming freely; this is a very lovely Orchid when grown strong and in small plants. They may be grown either in baskets or hanging-pans, the latter I prefer for several reasons, more especially for the facility they give for breaking the plants up and repotting. No settled weather now seems likely, and the orchidist must be continually upon the alert, for cold nights come upon us quickly, and unless the heating apparatus is in proper order, so that heat may be at once turned on, checks will sure to follow, and result in the spotting of the foliage, more especially so in the case of the Moth Orchids. It is a mistake to close the house entirely, with a well-meant idea of keeping down the bill for fuel; it is penny wise and pound foolish. *A. G. Catt, Parkfield, Hallow, Worcester.*

FRUITS UNDER GLASS.

MELONS.—It has been a difficult matter to get Melons of excellent flavour with such changeable weather of late, especially in damp houses; but much may be done by maintaining a brisk atmosphere and free ventilation where the fruits are ripening. With little sunheat and excessive moisture, either at the roots or in the houses, the flavour of Melons is greatly impaired, the fruits crack and decay before properly ripe, so that when the fruits cease to swell, great care is necessary, as a poor-flavoured Melon, however well it may look, is very disappointing when cut. It is also difficult to get well-ripened fruits in houses or frames with plants in different stages. Plants in frames, on a bed of manure, will have

made a gross growth if kept too moist, and to get well-finished fruits, the growths must be kept well thinned, so as to admit light and air. I advise careful use of the watering-pot for some time towards the finish, and if the plants show signs of rot at the collar, apply fresh lime and powdered charcoal, and syringe lightly for a time; indeed, in frames, the use of the syringe must be guided by the weather. Every opportunity must be taken to hasten the growth of Melons in cold frames, to get good fruits by early closing, and due attention to ventilation, not admitting cold air in large currents, as by doing so, prevents the fruits swelling properly, and green-fly and other pests make their appearance. Late houses should be planted at once if good flavour is required, as I do not care for Melons planted later than the middle or third week in August, and even these require good weather to get well-finished fruits. I like pots for late and early Melons, as less top-growth is made, and liability to canker is less; and they fruit sooner also with the roots restricted. Feeding can also be better attended to than when the plants have a large root space. I also advise a variety with thicker skin for late fruiting if the fruits are required to be kept for a time when ripe, as late in the year they will keep longer when cut and placed in a cool room.

CUCUMBERS.—If seed has been sown for winter fruits, these will soon be ready to transfer to their permanent quarters, and I need hardly add, to grow them well a clean well-heated house is essential to success. If, by chance, the seed-sowing has been neglected, no time should be lost in sowing at once in a nice bottom-heat, as the plants soon grow rapidly, and cover their trellis, if not allowed to fruit before winter. A few plants should be grown for autumn fruiting, to save cropping those required for winter work. A good light turfy loam is what they like. I prefer loam stacked a few months, with layers of horse-droppings placed at the time of stacking. If the house is lofty, use 18-inch pots for winter work, as these can be elevated, and fresh fermenting materials placed round the tops to encourage new roots in the winter, standing these pots on a warm, thoroughly drained bottom, giving a day temperature of 70°, and 10° lower at night for the present. *G. Wythes, Lion House, Brentford.*

THE APIARY.

MARKETING HONEY.—Much less would be heard about the trouble of disposing of honey if more care were taken by bee-keepers in getting it up for sale in a clean and attractive manner. It is more trouble, perhaps, but trouble in this direction pays for itself, and helps to create a greater demand for an undoubtedly wholesome and palatable article. Glazed cases for sections are made in great variety, and sections have the best appearance by being placed in those having glass on both sides, so that, if held up to the light, the clearness of the honey and finish of the section on both sides can be seen. Glazed cardboard cases are very good, and so are the enamelled ones, made of zinc or tin. The latter are now made in one piece, so as to fold up, after the fashion of a wooden section, and are, therefore, handier for transit from the manufacturers. They can be had in various tints—light shades of pink or blue are, perhaps, the best colours to set off the honey. Mr. Howard has a one-piece section case made of wood, to fold up precisely in the way of an ordinary section. It is grooved on each side, to admit of glazing, and the dovetail at one corner makes all secure. Before being placed in the cases, the sections should have all the propolis scraped off them, and they should be graded, those not so well sealed or finished being sold a little cheaper than the perfect ones. If shopkeepers do not seem disposed to buy, an arrangement can often be made for them to take the honey on sale or return, a commission of, say, fifteen to twenty per cent., being allowed on that sold. Extracted honey should be put into suitable bottles, the tall ones showing it off to the best advantage. Screw caps are a little more expensive but are to be preferred, as they look the best, and are less trouble than the tie-over ones. Bottles are now made to hold exactly a pound of honey, the ones previously obtainable being some ounces short.

ROBBING.—The robbing season has now commenced, and care must be taken not to leave any honey or sweets about, so as to encourage the evil, as once fairly started, it is often a difficult matter to

stop it. Entrances should also be contracted, and any opening of hives that may be necessary should be deferred till late in the evening. Robbing may often be stopped by hanging a cloth in front of the hive attacked, that has been steeped in the carbolic solution, or by some of the latter being sprinkled on the alighting board.

FEEDING UP.—The following is the recipe for making syrup for autumn feeding, and the sooner this job is finished the better, so that all may be stored and sealed over before the colder weather comes on: Five pounds of sugar to one quart of water, boiled for a few minutes. *Expert.*

THE FLOWER GARDEN.

BEDDING PLANTS.—Here the display, as viewed from the Castle windows and from the terrace walks, is very telling; the masses of crimson (Henri Jacoby *Pelargonium*), pink (Christine *Pelargonium*), yellow (*Calceolarias floribunda* and *amplexicaulis*), mauve (Tom Thumb *Ag-ratum*), deep blue (*Lobelia pumila magnifica* and *Salvia patens*—the latter the most distinct shade of blue-). White Verbenas, silver-leaved, brouze, and tri-coloured *Pelargoniums*, intermixed with yellow and blue *Violas*, *Phlox Drummondii*, *Heliotrope*, *Mignonette*, *Cineraria maritima*, and Morning Glory *Clarkia*, with its pretty reddish-purple flowers, the petals of which are tipped with white, showing to great advantage when contrasted with the display made by the twenty-four oblong and hexagon-shaped beds filled exclusively with carpet bedding (foliage) plants of various shades of colour. The above-mentioned kinds of bedding plants may be accepted as being thoroughly reliable and good all-round subjects for bedding purposes, affording the distinct and telling shades of colour; and those readers who have not got the kinds and varieties referred to above, should obtain cuttings and work up a stock, as cuttings are now plentiful, and their removal a matter of necessity, in order to preserve a uniform growth in plants filling the several beds, &c. This cutting into shape and trimming of every description of bedding plants, the picking off of yellow leaves and spent flowers, must receive frequent attention, as neglect of these simple, though highly necessary, cultural details for four or five days would considerably mar the effect of what might otherwise be a good floral picture. By following a judicious system of pinching and removing spent flowers and seed-pods from the plants forthwith, the flowering period of all subjects may be prolonged, as the young shoots resulting from the pinching process yield a succession of flowers. When *Pentstemons*, *Phloxes*, *Antirrhinums*, and such like plants are pinched or cut back, they break into fresh growth lower down the main stem, and flower much later than do the shoots that were not pinched, and although the side or lateral growths do not produce so fine flowers, what is lost in size is made up in quantity.

FOLIAGE BEDS.—These are rich in softness and brilliancy of tints, the silvery or creamy-white foliage of the *Mesembryanthemum cordifolium variegatum* contrasting most effectively with the bright-foliaged *Alternanthera amoena* and *A. versicolor grandis*, which blend with the soft golden-yellow *Pyrethrum*, the grey *Echeveria secunda glauca*, and the green and silvery *Sedums*. These need frequent thinning out, clipping into shape so as to confine each colour to its own panel or boundary-line, so as to properly define and preserve the character of the several designs, perfect neatness of the whole being the great charm of carpet or geometrical bedding.

GENERAL WORK.—This consists in pushing forward the propagation of all kinds of bedding plants that are not yet put in, the completion of the layering of *Caranations*, and insertion of pink pipings in handlights or frames placed on a gentle hotbed, prepared as recommended at p. 103 of *Gard. Chron.* for July 25, and treated in the manner there described. Cuttings of *Alternantheras*, *Verbenas*, *Mesembryanthemums*, *Salvia patens*, and such like, will strike best in a close, moist frame, the young growths from the bases of the plants being only used. Attend to the watering of large plants growing in tubs and pots about the flower-garden, also vases, and keep yellow leaves and over-blown flowers picked off the plants. Keep *Dahlias*, *Castor-oils*, *Sunflowers*, and the like, well tied to their supports. *H. W. Ward, Longford Castle.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

TUESDAY	AUG. 25.	Royal Horticultural Society's Exhibition of Gladioli, Orchids, Fruit, &c. Lecture by Rev. H. H. D'Ombraon on "Gladioli," at 3 P.M.
WEDNESDAY,	AUG. 26.	Newcastle-on-Tyne (three days). Harpenden.
THURSDAY,	AUG. 27.	Oxfordshire.
FRIDAY,	AUG. 28.	Falkirk. Sandy and District.

SALES.

MONDAY,	AUG. 24.	Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms, Dutch Bulbs, Liliums, &c., at Stevens' Rooms.
WEDNESDAY,	AUG. 26.	Dutch Bulbs, Liliums, &c., at Stevens' Rooms.
THURSDAY,	AUG. 27.	Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	AUG. 28.	Imported and Established Orchids at Protheroe & Morris' Rooms.
SATURDAY,	AUG. 29.	Dutch Bulbs, Liliums, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—60°·9.

Things "going to be" done. ATTENTION has frequently been called, in this place, to the unequal distribution of green spots in and around London, as shown on a coloured "guide" map, and, amongst other things, the hope was expressed, that parks and open spaces might increase and multiply—not such great spaces as the Regent's and Hyde Parks, but those of the "little and good" order. At that date, one could from the top of the Monument see many quiet nooks in the heart of the City, with its one or more trees and greenest of green turf. Today, looking from the same coign of vantage, some trees are still to be seen in the "square mile of the City," but, like unto the Dodo, trees threaten to become extinct. Were space allowed for their growth, the enormous piles of buildings shutting out the sun would act as life extinguishers. Since the time we speak of, five-eighths of the City's population have been dislodged and driven off to the circumference of greater London, and the recent census shows also that the parishes immediately adjacent to the "government" of the Lord Mayor are either gradually losing their inhabitants, or are stationary as to number of population. Those who sighed for and, Falstaff-like, "babbled o' green fields," have been driven nearer and nearer to the old limits of these only to lind streets, and squares, and terraces, and "groves" without trees, filling up the once-green margin of the metropolis. Where the population have not been drafted off in a wholesale manner, so-called "models" have been erected—huge blocks of barracks from some of which the sunlight appears to be quite excluded. There are large playgrounds in most of these "model" groups, but there are no

trees in them—even where there is any chance of their living. We have seen one exception, near the Surrey Theatre, and there the trees—part of an old garden—were doing well when last we saw them.

Driven far away from the heart of London, the displaced inhabitants have been earnest in their endeavour after open spaces, and to-day the record is a very promising one indeed. Commons have been taken in hand by the metropolitan authorities, and various generous individuals have either given open spaces free of cost for the good of all, or have made the terms of acquisition so easy as to make them irresistibly tempting. One among the latest of such "bits" is Clissold Park—dear to Stoke Newington. The other day, as recorded, a magnificent addition was made to Epping Forest, which is now almost at the end of some of our London streets. The myriad beauties of that "cockney elysium" are becoming well known to thousands who are not of the class devoted to tea and shrimps, or to frequenting the huge "taps" at the so-called "hostelries." Of its great work in connection with Epping Forest, the Corporation of London has every reason to be proud; all the reading world knows the story, and visitors from all parts of the world yearly feast their eyes on the beauties of Nature now so well cared for. The following is a brief record of things done, some of which, a score of years ago, were not even thought of. Placing on one side the older Parks, and adding to them Victoria and Battersea Parks, we have:—Finsbury Park, Hornsey; Southwark Park, Dulwich Park, Brockley Park, West Ham Park, Kennington Park, Clissold Park, Stoke Newington. Mention ought also to be made of Highbury Woods, Hadley Common, New Barnet; Clapham, Streatham, and Mitcham Commons, Peckham Rye, and Parliament Hill, Hackney; Plumstead Common, West Smithfield Garden (in front of St. Bartholomew's Hospital); and one or two open squares; all the old churchyards open for children to play in, and other places for recreation in crowded neighbourhoods, such as the Tower Gardens; and lastly, there is going to be opened, one of these fine days, the new Park called Highbury Park.* It will be seen that the newest of open spaces and parks are situated just where they are required; and the success of the agitation began many years since is great indeed.

From time to time attention has also been called to the paucity of markets for the sale of fruit, roots, and vegetables to the Londoner. As it was a quarter of a century since, so it is to-day; there are five markets in greater London—the Borough, Covent Garden, Farringdon, Spitalfields, and Stratford markets, the latter the most modern accession. The population to be provided for, numbers between four and five millions—at any rate well into the fifth million; in a few years there will be five millions, and as possibly there will then be no more markets than now, there will then be one market for each million of inhabitants! Who has been to blame for this, need not be noticed here—who will be to blame ten years hence if the number of market places be not doubled may be asked of County Councils. Were it not for the greengrocer, the ubiquitous "coster," whose carts and barrows are everywhere to be found, London would be much worse off than it is now. The ground got over by the coster in a morning is something to

* As we write, negotiations are being carried on between the Ecclesiastical Commissioners and the Fulham Vestry, in which the London County Council has been joined, with the object of securing for public use at Fulham several acres of land, to be laid out in proper style. There seems every possibility of the negotiations ending in the way desired.

think of. All the same, the distribution of our greenstuff in London is on a most barbarous scale, and constitutes a "crying" evil. Of course, there are many little street markets much frequented—not always by the very poor alone; but these are simply allowable under existing circumstances. Of late years, the City of London has been moving wisely and well in the matter of markets, and on the City's verge, close to St. Bartholomew's Hospital, are meat, poultry, fish, and provision markets, in which an enormous business is done day by day. The old Farringdon vegetable market having long since been condemned, the Corporation is now having a new structure erected—one of the great market blocks. The situation is somewhat near the bed of the long-diverted Fleet river (or ditch!), almost midway between old Field Lane, well-known to the Turpins and Jack Sheppards of the period, and the ancient Bear Garden close by Mount Pleasant, when, on occasion, lady (!) pugilists "put up their hands" for a purse. PEPYS, in his *Diary*, tells of this precious bit of Old London. The site of the market is near to that Ely Place of which our readers have on occasion read in these pages; it is also easy of approach from all parts of London, and beneath and around it are lines of railway, stretching away on every hand. Surely a fitting site for one of those things which were "going to be done" so many years ago, and which, whatever its size may be, promises to be well done. The contractors for the sub-structure—now finished—are Messrs. RUDD & SON, of Grantham, and their foreman, Mr. R. CAMPBELL, gave us a few particulars concerning this part of the contract, which are of interest. He stated about 25,000 yards of earth were removed from the site; that there are about 1300 tons of steel in the girders and columns; about 600,000 stock bricks used in the arching to form the floor of the market; about 6000 yards of concrete used in the formation of the same—all in cement. He states that the site is about 200 feet square; the sub-basement to be used by the Great Northern Railway as a goods depot. The superstructure will be the work of Messrs. PERRY & Co., of Bow, and will be composed chiefly of light cast-iron work on cast ornamental columns; the subbase being of Aberdeen granite, with a red-brick wall rising to window-sill line. The roof will be composed chiefly of light ironwork and glass. The architect is A. Peebles, Esq., and the new market will be opened early in 1892. The total cost will be about £60,000.

It may be objected that the new Farringdon Market is not half large enough—the proper objection is, as to the number of markets in the metropolitan area. Possibly when gas and water have been seen to by the folks at Spring Gardens, the subject now under consideration here may be placed in the hands of a Council Committee, with a result which surely cannot but be of value to the long-suffering inhabitants of the metropolis—and things in the market line now "going to be" done become accomplished facts.

STRAWBERRIES IN KENT.—Strawberry picking in Kent is done mainly by the London poor; the women earn about 2s. per week, but men considerably less—as a rule, girls beat boys by long odds at Strawberry picking. Fig. 28 represents a field of 50 acres, at Swanley, which has produced a large crop of Sir Joseph Paxton Strawberries. At Wood's jam factory, which is close to the field, about 50 tons of the fruit were daily made into pulp. The crop this year was heavy, and the advantage of a factory on the spot for such fruit is manifest. For our illustration we are indebted to the kindness of Mr. Cannell.

CARNATIONS FOR CONSERVATORY DECORATION.—The Committee of the Midland Counties Carnation and Picotee Society, desirous of encouraging the cultivation of these plants in pots for indoor decoration, offered liberal prizes at their exhibition on the 8th inst., for twelve plants grown in pots, not exceeding 6 inches diameter inside measurement, and only one plant in a pot. Unfortunately, the season is such a late one for these flowers, that the display of plants in pots was not of such an extent and character as it would have been ten days later, for Mr. C. H. HERBERT, the manager of Messrs. THOMSON'S nurseries, Birmingham, had

they can be grown easily in 5 or 6-inch pots quite well in the smaller size. The soil should, if possible, consist of good turfy loam in three parts, the other fourth of good leaf-soil and very rotten manure with a little coarse sand may be added, and potting very firmly. The plants should be kept in a well-aired frame, and watered only very lightly at first until they have root-hold, then more frequently, but always taking care not to over-water them, as it produces spots in the foliage. Of course aphid and any other pests should be well looked after. The Carnation and Picotee in pots for indoor decoration richly deserve a little attention, and I hope these plants

Constance Heron, Campanini, Clara Penson, Mrs. Herbert, Mrs. Payne, Lyddington's Favourite, Novelty, and Brunette. Mrs. Sharp and Campanini are very beautiful varieties for decoration. Then, amongst yellow-ground varieties with rich markings, Almisa, Annie Douglas, Rachel, and Stadrath Bail may especially be mentioned, but there are so many others also which are valuable as pot varieties. Amongst Carnations possessing the habit and qualities named were:—Self: Olivette, lovely pale rose; William Spinks, crimson; Dazzle and Gentle Jackie, both bright scarlet; Germania, pale yellow; Blushing Bride, a very fine variety; Mrs. Muir,

FIG. 28.—HARDY FRUIT CULTURE: STRAWBERRY PICKERS AT WORK AT SWANLEY. FROM A PHOTOGRAPH. (SEE P. 222)

potted up about 100 plants in 5-inch pots so as to make a considerable display upon the occasion, but as it was he could only muster the dozen plants in flower with which he took the 1st prize. "I have just seen his collection," writes a correspondent; "the plants potted-up are in full bloom, and I regret that they cannot be seen at a large exhibition as an example of the suitability of these plants for greenhouse and indoor decoration; a plant of Mrs. Herbert, a new variety, pure white with a wide margin of bright rose, has eleven blooms now open, and is a charming decorative plant. For growing on in pots, good sturdy plants which show side growths of 'grass,' should be selected and potted up by the end of March, and

will have more of this care devoted to them. The best varieties for this purpose are those which are not the tallest growers and are free-bloomers, and do not possess a split pod or calyx, and have a good constitution. Souvenir de la Malmaison and Mrs. Reynolds Hole are both well-known varieties. We have now a host of beautiful kinds, which are equal in colours to the two named, and have form, quality, and well-formed pods, and some of them fragrant. I noticed at Spark Hill the following varieties as possessing the qualities I have named above, and therefore suitable for small-pot culture, viz.—Picotees, having a white ground colour with rose, purple, or scarlet edging; Dr. Epps, Mrs. Sharp,

Mrs. Ford, and Annie Lakin, all three very fine white selfs; Mary Morris, pink; Mrs. Hewson Morris, scarlet; Cleopatra, rich purple. Others are, Terra Cotta, shaded salmon and maroon; Delicata, white, flaked with rose; Florence Nightingale, white, flaked with purple; and Alismonde, white, with bright scarlet flakes. This list can easily be added to, for we are now so well off for splendid self and fancy-coloured varieties; and those who had the privilege of inspecting Mr. Dodwell's extensive collection at Oxford must have been struck with the great headway our florists are making in these favourite flowers. Then we are fast losing the rough edge of so many of our border flowers, still

prized by those who know little or nothing of our greatly improved forms, with endless lovely shades of colour. We are also getting perfume in many of the kinds, and this is a great desideratum to those especially who do not grow for exhibition. Mr. DODWELL's bright lovely rose self, Euphrosyne, has a delightful Clove fragrance; and Mr. C. H. HEABERT's grand new scarlet and yellow Picotee, A. W. Jones, has a strong Clove Carnation-scented perfume, and is a fine pot decorative variety in the bargain. Others also are fragrant, a quality which will find favour with the ladies."

CAUTION.—We have lately been informed of more than one instance in which access has been obtained to nurseries and private gardens by persons representing themselves to be members of our staff. The last instance of the kind occurred on the 15th inst. at Croxteth Gardens, Liverpool. We do not, as a rule, send any member of our staff to make such visits without previously ascertaining whether or not such visit would be convenient; and the reporter, if a stranger to his host, should, moreover, present his card of introduction from the editor.

DEODAR CONING.—We have received from Mr. HERRIN, of Dropmore, and from Mr. MAYNE, of Bicton, cones of the Deodar. The only other we have seen is one produced a year or two ago at Kew. We hope to give a figure of the cone shortly, as it differs slightly from that of the Atlas and the Lebanon kinds.

THE CONFERENCE OF THE BRITISH FRUIT GROWERS' ASSOCIATION AT CARDIFF on Aug. 12 was held in conjunction with the local horticultural society's exhibition in the Sophia Gardens. A large tent was devoted to the Conference, which was largely attended, the Marquis of Bute presiding, and being supported by the Rev. G. A. Jones, Alderman Lewis (Deputy Mayor), Mr. T. F. Rivers, Mr. E. J. Baillie, F.L.S., of Chester; Mr. Blackmore (Secretary of the Cardiff Horticultural Society), Mr. G. Gordon, and Mr. Lewis Castle (Hon. Sec.). After a few words from the Chairman, Mr. Gordon gave a review of the work of the Association, and the extension of fruit culture. Mr. A. Pettigrew then read his excellent paper on "Hardy Fruits for South Wales," and Mr. E. J. Baillie an address on "Fruit Culture as an Industry," both printed in our last issue.

FRUIT CONGRESS AT MANCHESTER.—Preparations are now being made for holding a large exhibition of hardy fruits in the Royal Botanical Gardens, Manchester. The exhibition will open on October 20; the congress meeting on the following day.

BEGONIAS.—Messrs. LAING send us some Begonias grown by Mr. GOLD, The Gardens, High Ashurst, Dorking, from seed supplied by Messrs. LAING, and sown in January last. In point of size and doubleness these are very remarkable. In some the petals are regularly disposed as in a double Balsam, 4 inches across, another in which the column of stamens has been replaced by a long series of petals 5 inches long. In another flower a globular mass more than 4 inches in diameter is remarkable for the production of several centres. In other words several adventitious flowers are developed within the first flower. As malformations these are very extraordinary, very showy, and of great botanical interest; but they can hardly be called Begonias!

STOCK-TAKING: JULY.—The barometer of the "Stock Exchange" is a ready record of political and monetary disturbances, which fluctuates from day to day—nay, according to the evening papers, from hour to hour; the permanent record is surely that now before us in the Board of Trade Monthly Returns. It was evident at the close of last month that there were "in the air" such disturbances as affect trade and commerce; what was "in the air" is now chronicled, and we have to record a decrease in our imports for July of some £258,518, and in the exports of British and Irish products of £2,376,224.

Some of the nations of Europe are playing at "brag," and Russia is in the early throes of a serious deficit in her corn crops. Surely reason sufficient all this for the figures above recorded. It may be noted here that the imports for the first seven months of the year show an increase over the same period last year of £5,085,164; and that the decrease in exports over the same period is placed at £5,865,937—£3,489,713 being the drop for six months, all as compared with the first seven months of last year. The exports of foreign produce show an increase in the month of July amounting to £660,800—and a decrease in this export of £476,253 for the seven months. The following figures are abstracted from the "summary" of exports for the month last recorded:—

	1890.	1891.	Difference.
	£.	£.	£.
Total value for month	£32,082,629	£32,824,111	-258,518
§II.—(A.)—Articles of food and drink—duty free	11,969,090	12,103,213	+134,123
(B.)—do., dutiable	2,023,790	2,183,195	+159,405
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	3,407,637	4,107,537	+699,900
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,492,390	3,967,911	-524,479
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	945,029	905,328	-39,701
(B.)—Parcel Post ...	41,928	45,938	+4,010

The increase in the amount placed to the credit of the Parcel Post is worthy of note: it shows an increase of £4010 over the record for July, 1890. There is a not very pleasant note to make with respect to the imports from some portions of Greater Britain—recent correspondence in an evening contemporary stating that the fruits of their harvests go into the exchequer of the money-lender. This is very much to be deplored—and we think the fostering of agricultural banks in the districts affected by this not very modern parasite deserving the attention of statesmen in the localities affected. It is pleasant to record the increase in the corn-producing area of our sons across the water—of the cattle ranches and their fruit orchards; it is in proportion pitiful to note the prevalence of such a blight as the money-grub. The following are our usual extracts from the general returns, of interest to all growers, large and small:—

	1890.	1891.	Difference
§ II. Fruit:—			
Apples, raw bush.	12,453	27,055	+14,602
Unenumerated, raw	402,392	495,787	+93,395
Onions	191,606	265,984	+74,378
Potatoes cwt.	368,049	900,319	+532,270
Vegetables, raw, unenumerated value	£99,594	152,747	+53,147

There can be no time better than the present for considering an aspect of "stock-taking," which has not, so far as we are aware, presented itself to any of our contemporaries. The Board of Trade presents us month by month and year by year with very complete returns of our imports and exports. We know all about what the foreigner and the colonist send us in the shape of provisions and raw and manufactured materials. All things from and including Onions and gold, once a year we get to know as nearly as returns can tell us how much of all this huge mass is intended for London. Though, of course, much of this is manipulated and then started off to provincial towns, such as pork, which, after being passed through the "stove" is sent into the country as bacon. Who can tell what all the railways with a terminus in London draw from the country for

consumption in the Metropolis? All day and night, all the year round, provisions of every description, including fruits, roots, and vegetables, are being poured into London by nearly a dozen principal railway companies. What is it they bring, and how much is there of it? The companies cannot tell us this—rather, they state their inability to do so. We may, under these conditions, be forced to work out a system of averages, in order to get at a possible total. Thus, there are so many men, women, and children in Greater and Lesser London, each on the average consume so much fruit, roots, vegetables; so much beef, mutton, pork; so much cheese, butter, milk, spirits or malt liquors; and thus we get into the land of probabilities, which is the country of big figures and often of extravagances. But is the obtaining even correct aggregates an impossibility? A contributor to these pages during the last score of years essayed to have this question answered, so far as the commodities with which our readers are mainly concerned, and the results of his essay may be thus briefly summarised. He wrote to the traffic managers of all the great lines, and of their principal feeders, asking for the weights of the fruits, roots, and vegetables carried over the various systems to the metropolis as the consuming centre—also, if possible, and for purposes of comparison for the totals of 1890. All the traffic managers appealed to replied in the most courteous terms, some excusing themselves on one ground or another quite understandable, a few sent representatives or invited our contributor's personal explanation; the result, however, is—the figures respecting the food supply of London, so far as can be given by our railway companies, are not to be had; and it follows that, though quite able to give all the information respecting the supplies from foreign lands, we are in the dark respecting our home production. One official informed our representative that their system of entry was practically perfect, boasting that, did his company carry Sheffield wares, he could furnish not only the number and gross weight of cases or packages carried; but also the various items of contents! The representative of another line pooh-pooed the idea of any company being able to do such a thing. Evidently, however, there was a willingness to furnish all information come-at-able; and we can only hope that this department of "Stock-taking" may receive their early and kind attention. We may note that any day there may be found in the daily papers the "traffic returns" from all railway companies—so much for passengers, and so much for goods; this, doubtless, has its influence on share and stock transactions; such information as we require would help to "popularise" railways—make them more and more to appear as necessities of life, as most undoubtedly they are in a marked degree to the denizens of this great metropolis.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The inaugural meeting of this Society was held at the Literary and Philosophical Institute on the 14th inst. The chair was occupied by Wm. Angus, Esq., who delivered a very appropriate address. Mr. Bernard Cowan, of South Shields, proposed a resolution pledging the meeting to do its utmost to further the interests of the Society, and in supporting it spoke of the numerous advantages to be gained by mutual intercourse. He also advocated the establishment of a Botanical Garden in Newcastle, and spoke of the rapid development of public parks in the district. This was seconded by Mr. A. Heslop, and supported by Messrs. Smith and Irvine, each of whom urged gardeners and horticulturists generally to support the Society. The resolution was carried unanimously. There was a good attendance, and a great interest was manifested in the proceedings throughout. The following officers were elected:—President, Norman C. Cookson, Esq.; Vice-Presidents, Alderman Thos. Bell, and Wm. Angus, Esq.; Chairman, Mr. B. Cowan; Vice-Chairmen, Mr. A. Heslop and Mr. Irvine; Treasurer, Mr. R.

Moffatt, Leazes Park; Secretary, Mr. J. Hood, jun., West Parade, and a committee of four gardeners, four under-gardeners, and four amateurs.

THE FORMS OF LILIUM LONGIFLORUM AND BROWNII.

WE have had this year at Kew a far more extensive set of forms of these two species than ever we possessed before. So far as present information goes, I should classify them under two species as follows:—

Lilium longiflorum as a species is distinguished from *L. Brownii* by its flowers being more narrowly funnel-shaped when fully expanded, and by its more slender linear anthers and yellow pollen.

The typical *longiflorum* is so well known that I need not describe its peculiarities. It is now flowering in quantities at Kew, in full perfection at the middle of August in beds behind the Palm-house and south

south end of the temperate-house. In the rockery, it is now (August 12) in full flower. The stems are $1\frac{1}{2}$ to 2 feet long, the leaves linear, conspicuously three-nerved, 4 to 5 inches long, half an inch broad. The one to three flowers are half a foot long, tinged conspicuously with reddish-brown to the top on the outside, with the connivent funnel 4 inches long and $1\frac{1}{2}$ inch in diameter; at the top, the outer segment is 1 inch broad, the inner $1\frac{1}{2}$ inch, with the yellow anthers of the type, and pale stigma. In the temperate-house it has flowered a fortnight earlier, reached a height of 5 or 6 feet, with leaves 6 or 8 inches long, flowers but little tinged with brown outside, and an oblong capsule 3 inches long.

L. Brownii as a species is distinguished by its more open flower, the connivent funnel of which is 2 inches or more in diameter at the top, when it is fully expanded by its stouter anthers with bright reddish-brown pollen. We used to think this was the japonicum of Thunberg, but when Mr. Elwes was preparing his *Monograph* the authorities of the

amended description of the plant that flowered this year in the open air in Kew Gardens:—

Stem, 3 feet long, brownish towards the base. Leaves about forty, lanceolate, rather glossy, about 3 inches long, $\frac{1}{2}$ to $\frac{3}{4}$ inch broad, 3-nerved, the upper broader. Flowers 3 or 4 on spreading peduncles, 3 to 4 inches long. Perianth about 5 inches long, beginning to reflex an inch from the top, the throat of the funnel $2\frac{1}{2}$ inches diameter in the expanded flower. Segments all showing a distinct green keel both inside and outside, tinged with brown on the outside towards the base, both sets much narrower than in typical *Brownii*, the outer an inch broad at the top of the funnel, the inner an inch and a half. Stamens an inch shorter than the perianth, filaments pubescent; anthers $\frac{1}{2}$ inch long, with bright red pollen. Style more slender than in typical *Brownii*, and the stigma smaller and brownish.

The bulbs were sent, with those of *Lilium Henryi*, by Dr. Henry from Western China. There is a fourth form amongst Dr. Henry's bulbs which may be distinguished as var. *platyphyllum*. The flower of this resembles the last, but the stem is not more than a foot long, the leaves are broader and the anthers an inch long.

Var. *viridulum*, Baker, in *Gardeners' Chronicle*, 1885, pt. ii., p. 131, is a fifth form of *Brownii*, with very short broad leaves and flowers cream-coloured, hardly at all tinged with brown on the outside. It was introduced by Mr. T. S. Ware. Dr. Henry states that in the provinces of Ichang in Western China where it grows wild amongst the mountains, *L. Brownii* produced, when cultivated, as many as fifteen flowers. The inner segments in the cultivated plant are often a couple of inches broad.

I find in all these forms the style grows longer as the flower expands. When it first opens, the stigma is about on a level with the top of the anthers, but by the time the flower fades it overtops them. *J. G. Baker, Kew, August 12.*

JAMES O'BRIEN.

JAMES O'BRIEN.

JAMES O'BRIEN, born at Llanelly, Wales, January 26, 1842, belongs to a family of gardeners and Orchid growers, and although brought up for the civil service, a visit to his brother, who was gardener to Mr. East, at Lee in Kent, where there was one of the best collections of Orchids, and especially *Angraecums* and *Phalaenopsis* of the time, caused him to run in the old groove. He stayed there three years, and then went to Messrs. Parker & Williams, Seven Sisters Road, Holloway, to take charge of the Orchids and Ferns, and in a great measure, of the exhibiting. Afterwards he was with Robert Warner, Esq., in charge of the Orchids; then for a time with Messrs. Hugh Low & Co., among the Orchids. Subsequently he was for between two and three years Orchid and plant foreman at Robert Stayner Holford, Esq., Westonbirt, Tetbury. Then for a like time and in a like capacity with Robert Hanbury, Esq., Poles, Ware. On leaving the Poles he became manager for many years, during the palmy days of the concern, to Messrs. E. G. Henderson & Son, Wellington Road and Maida Vale, St. John's Wood, since leaving which firm, about 1882, he has taken no appointment. During all this time he has always been glad to give any information regarding Orchids, and has consequently had a large correspondence; among his correspondents being Charles Darwin and many other scientific men. Reichenbach scarcely let a week elapse without writing to him, and we, ourselves, are under great obligations to him for constant assistance in this department.

Mr. O'Brien, during his career, has had a good many men under him, who have turned out men of mark, and who are now occupying good positions in private gardens, and also as curators in colonial botanic gardens. His knowledge of garden plants, and his recollection of a plant once seen, have acquired him the reputation of knowing more plants at sight, and especially Orchids, than any man in Europe. Mr. O'Brien has for many years been a member of the Floral, Scientific, and Orchid Committees of the Royal Horticultural Society, and has acted as Secretary to the Orchid Committee ever since its formation.

of the Cactus-house. In the type the stems are $1\frac{1}{2}$ to 2 feet high, upper leaves glossy, an inch or more broad; the flowers are few in number, with no brown on the outside, 5 or 6 inches long, with a connivent tube, 3 or 4 inches long, and $1\frac{1}{2}$ inch in diameter at the throat; inner segments $1\frac{1}{2}$ to 2 inches broad, outer much narrower.

Takesima differs from the type by its brown stem, and flowers tinged with brown on the outside.

Eximium and *Wilsoni* differ from the type by their taller stems, more numerous broader leaves, and more numerous flowers, with a connivent tube 5 to 6 inches long, not tinged with brown on the outside, but, as in the type, faint green in the bud stage; the outer segments, when expanded, faintly tinged with green, and the inner with a narrow faint green keel. There is an excellent figure of *eximium* in Elwes' *Monograph*. *Harrisii* only differs from *eximium* by its more robust growth and more numerous flowers.

We have had *formosum* this year at Kew, both out-of-doors in the rock garden, and indoors at the

museum at Upsala kindly lent us Thunberg's type specimen, and we found, to our surprise, that it was not this species, but what we had been calling *Kramerii*, so that we had to fall back upon the next oldest name for the present plant, which is *Brownii*.

The typical *L. Brownii* is well known. It is widely cultivated, and is well figured in the *Monograph* of Elwes, and in the *Flore des Serres*. The name *Brownii* was first published in 1845 by Mieliez, after a nurseryman at Slough. We have not at present in cultivation at Kew the *Oderum* of Planchon in *Flore des Serres*, t. 876, 877. This is the plant that is figured under the name of japonicum by Dr. Gawler in the year 1813 in the *Botanical Magazine*, t. 1591, and was described as such in my paper in the *Gardeners' Chronicle* for 1871. It is more delicate than typical *Brownii*, with flowers less tinged with brown on the outside, a whitish or yellowish bulb, not a brown one, with narrower scales, green, not reddish-brown stems, and thinner, less glossy leaves.

Dr. Henry's *Chloraster*, I now think, must be placed as a variety of *Brownii*. The following is an

HOME CORRESPONDENCE.

TURNIP FIELD PEST.—Since my letter of the 30th ult. to the papers on the above subject, I have received numerous inquiries about Brentini's "Lessive." Will you allow me to state through your columns, that full particulars may be obtained from the Secretary to the Evisell Syndicate, Ltd., 76, Finsbury Pavement, E.C. *George P. Ivey.*

FUCHSIA TRIPHYLLA.—This singularly distinct and charming species is now in flower in one of the temperate houses at the Botanical Gardens, Birmingham. Mr. Latham states that in order to flower it a little warmth is required—more than can be had in a cold greenhouse at this season of the year. It is a shrub-like plant of somewhat horizontal growth, the small orange-scarlet flowers hanging down from the branches. Of more botanical interest perhaps than of decorative value, it is yet a plant well worthy of cultivation, though possibly very scarce. Mr. Latham states some have failed to flower the species, but under the treatment given to it at Edgbaston it flowers fairly well. *R. D.*

SETTING UP CARNATIONS FOR EXHIBITION.—I hope we are fast nearing the time when the practice of setting up these flowers with paper collars will be a thing of the past. This sentiment will be echoed by many, whilst some will cling to the idea that the "paper collar" is still desirable, and flowers cannot be shown off properly without them. I think this formal and unnatural method cannot be too strongly condemned, and along with it the manipulation and mutilation termed "dressing." A good example of setting up Carnations for exhibition was given at the Royal Horticultural Society's show, held in the Drill Hall, Westminster, on August 11, by the Royal nursery, Slough, the flowers being set up after the manner of single Dahlias, about six in a bunch, with a little foliage; the effect was grand. Needless to say, this system is far preferable to that of the "paper collar," which the sooner it sinks into oblivion the better. *George Phippen, Reading.* [We cordially agree. Ed.]

AMARYLLIS HALLI (see p. 172) is a garden synonym of *Lycoris squamigera*, a plant of which there is a good figure given in *Garden and Forest* for April 9, 1890. It is there said to have been originally brought from China by Dr. George R. Hall, of Bristol, Rhode Island. The bulb of this perfectly hardy Amaryllid is large and globose, with a long neck; the leaves, which are about 1 foot long, wither in early autumn, and when the bulbs are strong enough the flower-scapes will appear. The colour of the flowers, numbering five on an average, is a light rose colour, with pencillings of a peculiar bluish-grey. *C. G. van Tubergen, Jun., Haarlem.*

LILY OF THE VALLEY.—I have sent you two dozen Lilies of the Valley. We cut for the Henley Regatta 2000 spikes, have been cutting eight dozen a week since then, and have still a few more. For the last three years I have kept them till July, and find them most useful during the London season. For one dinner party last July, I had over 2000 on the table at once, which were much admired. *Henry Perkins, Greenlands.* [These were received on the 6th inst. Such fine fragrant racemes of pure white flowers are always useful. Ed.]

STOCKS.—It is an acknowledged fact that stocks, procured as suckers from trees, are prone to send up (however well dressed and disbudded) numerous suckers, particularly so in the case of Plums worked on the Mussel, Brussel, and Brompton stocks, gradually producing more as they increase in age, however carefully they may be removed. The cause of it, I have thought, may be the manner in which they are propagated, as the Plum, Myrobalan, St. Julien, Black Danson stocks, &c., which are produced by seed and cuttings, do not throw up suckers as do the other stocks. *R. G. L.*

THE BLACK DIAMOND MOTH.—Several fields in the vicinity of Falkirk have been ploughed down owing to the total destruction of the Turnips. The method generally pursued for their destruction is brushing, by means of branches of Broom and Spruce tied to the sides of small harrows, these drawn between the rows sweep the underside of the leaves, displacing the caterpillars which are buried by the teeth of the harrow, and leaving the leaves upturned. Where this operation has been followed at an early date by heavy rains, the Turnips have been so far freed of the pest that no permanent harm to the crop is feared. *R. G. L.*

MILDEW.—In these gardens, and hereabouts generally, mildew seems very prevalent; in some instances, several crops of Onions have entirely disappeared. One bed has been slightly attacked, but fortunately not to such an extent as to make the crop useless. I attribute this in a certain degree to the liberal dressing of soot when the seed was sown, and after it was up a few inches above-ground. Peas have become very much affected, and these in some cases close at hand so much affected as to render them perfectly useless. On one plot in these gardens the crop has failed to open the flower toward the tops of the sticks, and later crops appear as though they would be useless. All sorts seem, upon this plot, to be affected. Upon another plot, where I have them more especially cared for, and where they are growing in trenches, they seem to have escaped, since they are growing as freely as possible. This indicates that deep cultivation is probably an essential part of Pea cultivation. Chrysanthemums have taken the mildew rather badly, but in this case it can be attacked rather more forcibly than the kitchen garden crops. Roses and Vines have also suffered somewhat, the latter case those with outside borders being the worst. I think the wet, cold nights we have experienced all through the season have had a great deal to do with it, and previous extreme drought. *W. A. Cook, Compton Bassett, Wilts.*

MR. MARTIN SMITH'S CARNATION PRIZES.—So much has been said of late concerning these prizes, and the consequent competition, that it was very natural public attention should be called, as it was called, at the James Street Drill Hall on Tuesday of last week, to the singular action of the donor of these prizes in allowing his gardener to partake in the competitions. That course seems to me to evidence a strange sort of exhibition ethics. True, I have met with it before elsewhere, but have always found the practice condemned, but I had never seen it in such rampant form, as in this particular instance. I can very easily understand now why the proposals that the prizes should be given to Carnations grown and flowered at Chiswick were not acted upon. Had such been the case, every competitor and every plant sent for competition would have stood upon its own merits, and the flowers would have been seen in all their real character, and not as grown under protection from heavy rainstorms. Only in one instance did I hear the practice of the donor of the prizes in competing for them himself approved. Almost universally it was condemned. That Mr. Martin Smith may have desired not only to show Carnations, but how to stage them, was but natural and right; but certainly, in my estimation, it would have been better to have done so in an honorary collection. The late period of the competition quite destroyed the chances of some intending exhibitors. *A. D.*

"BEATING THE RECORDS."—I quote this phrase from a communication recently received from Mr. Samuel Barlow, Stakehill House, Castleton, near Manchester. He stated, in a letter bearing date August 3, that he was sending a stand of Pinks to the exhibition of the Carnation and Picotee Union at Oxford on the following day, August 4, and he remarked, "I think we have beaten all records this season; it has scarcely ever happened that Tulips were shown in London on June 23, and Pinks on August 4." And then Mr. Barlow went on to describe the week as one of the worst ever experienced in Lancashire during the summer-time, and especially to finish July with; temperature, 38° on two or three nights, no sunlight, wind north-east; much use of gas during the day-time in works and house at Stakehill, and at the warehouse in Manchester; day temperature, 46° to 58°. One scarcely wonders that Mr. Barlow should regard as possible the exhibition of Carnations in October, should some of the blooms escape the rot which is destroying so many of them in the bud stage. *R. D.*

NOTES FROM OAKWOOD.—We have this year bloomed a number of plants of the Lily which is known in Japan as *Lilium odorum japonicum*; it has by far the pleasantest smell of any Lily I know, that of a sort of refined Tub-rose. Our first plants bloomed in a shady Lily house in the cottage garden; these were pure white, both inside and outside of the petals. A well-known amateur gardener, who went to see them in the evening, first called my attention to the delightful smell. The next in order of blooming were in the conservatory here; these had a slight brown tinge on the back of the flowers. Then those which bloomed in the open border in the Wisley garden, had the backs so dark, that at first

sight they might have been taken for *L. Browni*; these last have the back of the flowers very much darker when grown in the open air than when grown in a house. My gardener here has been in the habit of planting *Taberoseas* in pots, and then bedding them out; these give finer flowers than those kept under glass. Last year, on December 4, he planted six bulbs in the border under my window; all six have come up: one has a good flower spike, another shows that it will flower, the others are doubtful. I should not have thought they could have survived the severe winter; they had no protection. At Oakwood, under a gable of the cottage, there is a martin's and a wasp's nest side by side, and touching each other. The inhabitants do not seem to interfere with one another. *George F. Wilson.*

ADIANTUM FARLEYENSE.—I have a big plant of this Fern, of which I am a great admirer, and have grown a specimen nearly 5 feet through. This plant has always produced a fine lot of young foliage in the spring, and never showed any abnormal growth until last spring, when it produced a great many abnormal fronds, specimens of which I forward by this post for your inspection. The fronds look as if they are fertile, and by examining them through a microscope, I believe I have seen sori and spores. Is this not of very rare or almost unique occurrence with the Fern in question? I see in an issue of the *Gardeners' Chronicle* for August 18, 1888, an article of Mr. T. M. Shuttleworth's, running as follows:—"It is the first I ever had, and Mr. Goldby's communication was highly interesting to me, all the more so, as I have on several occasions, in past years, written on this subject in your columns, having failed after more than twenty years' experience of growing this Fern in all sizes, to find even a trace of fructification. *C. G. Van Tubergen, Jun., Haarlem.* [We found a few abortive sporangia, and nothing more. Ed.]

INCREASING PINKS.—The present is a capital time to raise a batch of new plants of the various kinds of Pinks, either for flowering in pots or for planting in the borders for next season's display. All that is needed is to pull some old roots into pieces, chop out a trench about 3 or 4 inches deep, according to the length of the slips, place a layer of sand and decomposed leaves at the bottom of the trench, place the pieces in the trench 4 inches apart, fill in the soil, making it firm about the plants. In a few weeks nice little tufts will be obtained. *A.*

GARDENERS' ORPHAN FUND.—It is a good plan for gardeners to give a little of their prize-money to this excellent Institution. I have occasion to go about a good deal, acting as judge at flower and fruit shows, and whenever I have appeared to the prize-takers, they have invariably promised to send the sum (only 5s) to make them a member. I trust someone will put up a box in the Waverley Market, Edinburgh, on the occasion of the great International, where there will be so many gardeners who would doubtless spare something towards the orphans. My little protégé, whom I successfully carried at the top of the poll, was of Scotch parents, and born in Ireland, so that there is no partiality shown to any particular nationality. *J. Rust, Eridge Castle.*

POLEMONIUM FLAVUM HYBRID.—*Polemonium flavum*, said to be a distinct species from *P. cœruleum*, produced last year seedlings so like it that I took especial care in gathering and marking some seed of typical *P. flavum*, which I sowed early in the spring of this year. About twenty seedlings are now in flower, and two-thirds of them are producing white flowers not distinguishable from those of *P. cœruleum* var. *alba*. One only has blue flowers. The habit of these plants is far more branching than that of typical *cœruleum*, the stems being divaricate, and producing axillary flowering branches nearly to the base. I take them to be hybrids. The appearance of the plants is an improvement on the type of *cœruleum*, and they are quite barren, while the type produces seed on every flower-head. A small proportion of the seedlings came true *P. flavum*, but very weak, and nearly smothered by the robust hybrids. I enclose specimens. *C. Wolley Dod, Elye Hall, Malpas.*

DECAYING OF PEACHES.—Refering to the inquiry on p. 196 of your last issue, regarding Peaches, I have always found the cause has been an insufficient supply of air. Some Peach-houses have a very humid atmosphere, which causes mildew, damp, and decay. If the house is kept sweet, and abundance of air admitted, decay in unripe Peaches will not be heard of. Constant syringing, and keeping the house closed, is the cause. If a green moss appears

on the soil, or anywhere in the house, then be assured there is excessive moisture, and an insufficient supply of air. *Thrumpton.*

ORCHID NOTES AND GLEANINGS.

ONCIDIUM FORBESII, Hook., VAR. MEASURESIANA.

THIS very distinct variety flowered for the first time in the collection of R. H. Measures, Esq., Streatham. It differs from the type in the following characters:—The flowers are of a pure golden-yellow colour, except the very narrow border, which is of a very singular colour—intermediate between yellow and purplish-brown. The tubercles of the lip are arranged in a manner which, in contrast with that in all other of the same section, may be very easily described. There are two tubercles in the base of the lip, which run together, and form a big rose-like crest, at both sides of which are two converging lines of smaller tubercles, at the same distance one from the other. The wings of the column are not quite identical with those on the plate in *Bot. Mag.* t. 3705, but the differences are not sufficient to establish a new species, inasmuch as the descriptions of the previously-described species of this very polymorphous Brazilian group must be pointed out with more accuracy, and will require a careful re-examination by the author, who will devote his time for many years to the Orchids of this country. The appearance of the raceme of the large, full, expanded, bright golden-yellow flowers, is very brilliant, and we may congratulate Mr. Measures on this enrichment of the midsummer Orchid flora. *Dr. Kriänlin.*

SOCIETIES.

ROYAL HORTICULTURAL.

WEDNESDAY, August 5.—The Floral Committee met at Chiswick on the above date. Present: W. Marshall, Esq., in the chair; Messrs. Dean, May, Paul, Furze, Herbst, Leach, Jefferies, Gordon, Watson, Fraser, Goldring, Noble, Baines, and Phippen. The Committee examined the collections of Carnations, Violas, Pansies, Fuchsias, &c., growing in the gardens, when the following awards were made:—

Three Marks.

- Carnation, White Queen (Fisher, Son, & Sibray), white self.
- .. Snowdrift (Fisher, Son, & Sibray), white self.
- .. Edith (Fisher, Son, & Sibray), pale pink, spotted scarlet.
- .. Penelope (Hooper), white self.
- .. Dante (Hooper), rose flaked.
- .. Maggie Laurie (Dicksons & Co.), delicate blush self.
- .. Guiding Star (Ware), scarlet self.
- .. Rowena (Dean), bright scarlet.
- .. The Moor (Dean), dark crimson.
- .. Mrs. Reynolds Hole (Veitch), terra cotta.
- .. Alice Ayres (Veitch), white, rose edge.
- .. Achilles (Novelty Seed Company), deep red streaked.
- .. Hogartner Schaffner (Benary), scarlet striped.
- .. Albrecht Duesser (Benary), deep rose, crimson flake.
- .. Madame Van Houtte (Benary), yellow ground.
- .. Professor Vrchow (Benary), rose flaked.
- .. Dan Godfrey (Turner), scarlet flake.
- .. Agnes Chambers (Turner), yellow ground, lilac edge.
- .. No. 97 (Douglas), yellow, faintly striped.
- .. No. 62 (Paul & Son), crimson flaked.
- .. Grandiflora (Veitch), deep rose.
- Picotee, Margaret Rueder (Benary).
- .. Redbraes (Benary).
- .. Romeo (Paul & Son).
- .. Mr. Rudd (Turner).
- .. Favourite (Turner).
- .. Mary (Turner).

Two Marks.

- Carnations, Rosy Morn (Douglas), pink.
- .. J. R. Allinson (Ware), rose self.
- .. Fourball (Benary), deep scarlet self.
- .. Horace (Dan), scarlet self.
- .. Beatrix (Fisher, Son, & Sibray), buff self.
- .. Terra Cotta (Turner), streaked.
- .. Van Dyck (Benary), slate and crimson flaked.

Three Marks.

- Godetia, Duchess of Fife (Daniels Bros.), blush with large carmine blotches.
- Chrysanthemum (annual), Sibthorpi (Dean), bright yellow, very free flowering.
- .. (annual), multicaule aureum (Dean), yellow, dwarf.
- Viola, The Mearns (Dobbie & Co.), lower petals dark purple, top pale lilac.
- .. Croft House (Dobbie & Co.), white, fine habit.
- Pansies for strain (Dobbie & Co.).
- Pansies for strain (Hooper).

Two Marks.

- Viola, virginialis (Dobbie & Co.), large pure white.

Three Marks.

- Sweet Peas, Mrs. Sankey (Eckford), pure white, fine.
- .. Mrs. Gladstone, delicate pink standards, wings blush, edged with pink.
- .. Captain of the Blues, standards bright purple blue, wings pale blue.
- .. Princess of Wales, shaded and striped mauve, on white ground.
- .. Isa Eckford, creamy white, suffused with rosy pink.
- .. Senator, shaded and striped chocolate on creamy ground, fine.
- .. Countess of Radnor, pale mauve standards, wings pale lilac.
- .. Monarch, bronzy crimson standards, rich deep blue wings, fine.
- Fuchsia, Floon de Neige (Cannell), single white corolla.
- .. Berlin's Kind, Gustave Dore (Cannell), double white.
- .. First of the Day, Adolphe Legour (Cannell), single red.
- .. Earl of Beaconsfield, Aurora superba (Cannell), salmon.
- .. President Grévy (Lemoine), fancy.
- .. Pentstemon, La Foudre (Lemoine), fine scarlet.

FRUIT AND VEGETABLE COMMITTEE.

A meeting was held at Chiswick on this date. Present: P. Crowley, Esq., in the chair; Dr. Hogg, Messrs. Lee, Rivers, Warren, Dean, Bates, Balderston, Willard, Cliffe, Denning, Reynolds, Hudson, and Wythes.

The Committee inspected the collections of Runner and Dwarf French Beans, &c., growing in the gardens, and made the following awards:—

Three Marks.

- Dwarf French Beans, Mohawk, Smyth's Speckled Hybrid, Fulmer's Forcing, Lion House, Ne Plus Ultra, Dark Dan, Ne Plus Ultra (Veitch).
- .. Ne Plus Ultra (Harrison).
- .. Wax Mont d'Or, yellow-podded Butter Bean, found to be of excellent quality (Vilmorin).
- Pea, Sequel (Laxton), dwarf, deep green Marrow.

ANNUAL EXCURSION OF THE ROYAL SCOTTISH ARBORICULTURAL.

(Continued from p. 201.)

MESSRS. KENNEDY AND CO.'S NURSERIES, DEMERIES.

A number of the company paid a visit to these nurseries before breakfast on the morning of the 7th. The nurseries are between 50 and 60 acres in extent, and are well stocked with forest trees, fruit trees, and ornamental shrubs. In some aspects, Ash, Hazel, and Silver Fir appeared to have suffered considerably from a severe frost which occurred on the 15th and 16th of May last. The frost appears to have been general throughout the district.

At 10 o'clock the party, over seventy strong, started for Kirkconnell, the seat of R. Maxwell Witham, Esq. A drive through a rich agricultural district, and along an avenue of Oaks, remarkable for great girth of bole, but low elevation, and many branched, wide-spreading tops, brought the party to Kirkconnell, where they were cordially welcomed by Mr. R. Maxwell Witham, Mr. Maxwell Witham, Jun., and Captain Stuart, of Shambellie.

KIRKCONNELL

is situated on the estuary of the Nith, the park is extensive and abounds in old well-preserved trees. There appeared to be few young plantations, and scarcely any of the trees so numerously introduced within the past forty years; the whole place has thus an ancient air about it. The date of the old square tower in the mansion is of the troubled time of Edward I. Of the age of the venerable Oaks that surround the house on all sides no record is known, but their size betoken great age, although there is no sign of decay in any of them. Both varieties, sessiliflora and pedunculata, of the British Oak occur in the park.

Among the few trees that were measured was an Oak, 16 feet 5 inches at 3 feet up, and at 5 feet, 14 feet 3 inches, while several were 13 feet and 12 feet odd. One Spanish Chestnut at 5 feet gave 15 feet 9 inches, another 17 feet 1 inch. A splendid Walnut, for Scotland, girthed 10 feet 8 inches at 5 feet. The widest spread Oak was one with a perfectly symmetrical head, which measured in two directions at right angles 98 feet; the bole was 10 feet 10 inches at 5 feet. Near this latter, and close by the bank of the estuary, stood the Salmon Oak, so called because the monks of an abbey near by were accustomed to receive their tithes of salmon under its shade. The bole of this tree was one of the longest we noted, being 18 feet; the girth 9 feet 5 inches. A Fern-leaved Beech of rather unusual proportions near the house is worthy of mention—the stem girthed 8 feet at 5 feet from the ground, and the top was lofty and widespread, but it was observed that the leaves on some of the upper limbs were reverting to the typical form of Beech. A Sycamore, with hollow trunk, near the rear of the house, measured 15 feet 9 inches. At the conclusion of the inspection of the park and trees, the com-

pany were conducted to the dining-room in the old tower, and were served with refreshments. Professor Bayley Balfour cordially thanked Mr. Maxwell Witham in the name of the Society for his kind and hospitable reception.

The excursionists then started southwards by way of Shambellie, the road passing through some extent of very fine Scotch Pine and Larch plantations on that estate. A halt was made at New Abbey to inspect the remains of Sweetheart Abbey, one of the most complete ruins of the kind in the south of Scotland. It was founded in 1275, by Devorgilla, wife of Baliol, and the ruins of her tomb still remain in the chancel.

Passing along the eastern base of the Criffell Hill, well in view of the Solway, the Cumberland shore of which was clearly visible, Southwick, the seat of Mr. Mark Stewart, M.P., was reached. Although invited to stop and inspect the woods here, which, judging by such portions as came under the view of the party, would have afforded considerable interest, the time at disposal did not permit of more than a drive through the heart of the policies en route to

MUNCHES,

which was 20 miles off, but was reached about 4 p.m. Here the party were met by Mr. Maxwell, of Munches, Mrs. Maxwell, and their three sons, and several guests of Mr. Maxwell, among whom were Mr. Mark Stewart, M.P., and Dr. Cleghorn, of Strathvithie, Vice-President of the Society. Mr. Maxwell led the way to a large marquee erected on the lawn for the occasion, in which a luncheon was provided and partaken of with zest by the hungry visitors. Mr. Maxwell presided, and proposed the toast of "The Queen—our Patron," which was warmly received. Mr. Maxwell then gave the toast "Prosperity to the Royal Scottish Arboricultural Society." He need say little regarding the objects of the Society after the addresses of the President in Edinburgh on this subject. They had, no doubt, all heard the saying, "Be aye stickin' in a tree, it will be growin' while ye're sleepin'." But in many districts there had been a great deal of 'stickin' in of trees where they would never grow if their planters slept for ever, and it was one of the great objects of this society to disseminate knowledge as to what trees were suited for the different parts and conditions of the kingdom. For want of that knowledge, great loss had been caused and great mischief done. They had no grand woods around here such as the Society may have seen elsewhere, and what they had, had suffered greatly from the storms about eight years ago. Their great object for several years past had been to repair that damage. It was, however, very discouraging to planters to find their young woods attacked by disease. Again, they were discouraged by that curse of all their forests—rabbits. In his boyhood, rabbits did not exist here; now, one of the great questions they had to solve was, how to preserve their young trees from rabbits. He had great hopes that the Corsican Pine, which rabbits did not touch, would yet take a good place in their woods. Personally, he had planted out a good many of this Pine, and was satisfied with it.

Professor Balfour in reply said, he was sure that if all proprietors were as liberal minded as Mr. Maxwell and other members of the Society, forestry in Scotland would have been in a different position to what it was to-day.

The company then dispersed in several groups under the guidance of Captain Stewart, Mr. Donaldson, forester, and Mr. Murray, gardener, to inspect the woods and pleasure grounds. The latter were rich in ornamental trees and shrubs, such as *Acer negundo variegata*, *Pelea trifoliata*, *Quercus cerris variegata*, *Shepherdia canadensis*, Japanese Acers in great variety, and in most instances doing well, and quite bardy; and *Prunus Pissardi*, the latter fruiting in the open on a wall. It may be noted that a fine dwarf standard, in a pot, of this *Prunus* had a dozen or more ripe fruits upon it, the plums being perfectly round, and nearly the colour of the foliage. Several fine clumps of *Rosa rugosa* were noticed, one in particular, measuring 9 feet through. A considerable collection of *Lonicera*s, in groups, in the woodland part of the grounds, some, such as *L. tartarea splendens* being very bright, with its twins, or pairs, of crimson shiny berries.

Phormium tenax and *P. t. variegata* are perfectly bardy here, many grand clumps of it in the pleasure-grounds having stood out for years; some of them had the remains of the flower-stems of last year still attached. As mentioned in the note at p. 173 of

our last issue, one clump showed the remains of nine great flower stems.

Among Conifers there were some remarkable specimens, one of *Wellingtonia gigantea pendula*, the most perfect that many of the company had seen, was about 20 feet high; *Cryptomeria japonica* about 25 feet high by about the same diameter at base; *Abies Alberti*, 69 feet high; *Sciadopitys verticillata*, 9 feet high, in beautiful dark green colour, indicative of perfect health. The largest Scotch Pine girthed 10 feet 6 inches; the largest Corsican Pine, about thirty years old, girthed 3 feet, and the height was about 45 feet. There are throughout the woodlands many specimens of the older arboreal occupants, in the shape of grand old Oaks and Scotch Pines, many of the contemporaries of which were wrecked in the storms alluded to in Mr. Maxwell's speech at Munches, and the shelter of many of these is taken advantage of to rear splendid specimens of *Thuja gigantea* and *Cupressus Lawsoniana*, which are attaining great size; the largest of the latter was 50 feet high, and a perfect specimen of its kind. Several specimens of *Abies Douglasii Stairii* met with had a very pleasing effect, in contrast with more sombre-tinted things; the largest, and it is the largest in these parts, was about 12 feet high. The well-appointed gardens deserve more extended mention than space will allow on this occasion. After tea, the company drove to Dalbeattie station and took train to Stranraer, where they were to rest for the night.

Next morning, a considerable number of the members visited the nursery of Messrs. Smith & Sons, of Stranraer, which extends to about 40 acres, and which was occupied with a miscellaneous stock of ornamental trees and shrubs and fruit trees, but largely also with the specialty of the firm (Roses), for which they are so well known throughout the country.

CASTLE KENNEDY.

After breakfast the party started for Castle Kennedy. Arriving at the entrance to the Castle grounds on the New Luce Road, the party made the circuit of the White and Black Lochs, two splendid expanses of water, divided by the peninsula on which the old Castle stands. The company walked to the south front of Lochinch Castle, where they were met by the Earl of Stair. From this point could be seen extensive terraces, with the noble sheets of water in the background, encircled by a panorama of richly wooded slopes all round in the distance. The terrace garden, stretching from Lochinch Castle southward to the grand ruin of Castle Kennedy, richly mantled in Ivy, cover between 70 and 80 acres. It is chiefly on this space that the famous collection of Conifers is arranged in avenues and in groups; viewed from a distance the characteristic forms of *Cupressus macrocarpa*, *Abies nobilis*, *Araucaria imbricata*, *Picea morinda*, *Pinus insignis*, and others had a most charming effect. Closer inspection, however, revealed that many of the specimens which had reached noble proportions were on the decline, and whole avenues were murred by the gaps made by deaths. Exhaustion of the soil, which was never very suitable for Conifers, combined with the fierce gales of brine-laden winds that frequently sweep across the narrow neck of land on which Castle Kennedy stands, from Luce Bay to Lochryan, have a debilitating effect upon these splendid forms.

Many of the *Abies nobilis* had reached the height of from 40 to 50 feet, and one could realise from those that remained intact and healthy in the great avenue formed by this species, what a noble feature it would have been. *Picea morinda*, of which another avenue is formed, has suffered less, but *Cupressus macrocarpa* has reached splendid proportions, but also shows the effects of the saline winds. In more sheltered parts there were to be found grand specimens of such species as *Pinus macrocarpa*, *P. Lambertiana*, and *P. insignis*. *Araucaria imbricata* appeared to hold its own against the unfavourable conditions better than any other Conifer. The avenue formed of it was perfect in its way, the trees averaging about 40 feet high, with ample spread of branches from near the base. Many also were bearing splendid cones.

On the walls of Lochinch Castle we found *Eucalyptus globulus*, *Aloysia citriodora*, *Eurybia ilicifolia*, *Arbutus Andrachne*, and *Eriobotrya japonica*, well-developed plants, which had never received protection in winter since they were planted out years ago, thus testifying to the mildness of the temperature. Further evidence of this was found in clumps of Sikkim *Rhododendrons*, which had been planted out many years, and had attained to great size:—*R. Aucklandi*, 10 feet spread, by 9 feet high; *R. barbatum*, 7 feet; *R. glaucum*, 5 feet; *R. niveum*,

4 feet; these names and figures show what has been accomplished here in establishing tender things in the open. The foregoing species, and many others, flower freely every year. A fine specimen of *Eucalyptus amygdalinus*, with spreading rounded top, and 20 feet high, growing on an elevated site, is another indication of the mildness of the winters here. Dense sturdy bushes of *Fuchsia coccinea* and *F. Riccartoni*, intermixed with *Rhododendrons*, and other shrubs; in the clumps of *Phormium tenax*, some of them bearing the stems of last year's inflorescence to the number of thirty, each laden with plump seeds, which will ripen in due course. Splendid specimen trees of *Quercus flex*, and hedges of the same, were much admired. Approaching the new kitchen garden, is a noble avenue of Golden Queen Holly. A hasty inspection of the kitchen garden and hothouses satisfied everyone of the completeness of the equipment of that department of this remarkable place, and the splendid crops of Grapes, Peaches, Figs, &c., indoors, and the crops out-of-doors all bore testimony to the skill of Mr. Cruden, the gardener. The party had been increased here by the arrival of Sir Wm. T. F. Wallace, Bart., of Lochryan; Mr. Maxwell, of Munches; Dr. Cleg-horn, the Rev. Thomas Barty, D.D., Kirkcolm; Mr. Thomas Easton, M.D., Stranraer. The guidance of the party over the extensive grounds and policies was undertaken by Mr. Hogarth, the forester; and Mr. Cruden spared no pains in making the inspection interesting to all.

The company returned to Stranraer by a different route, the road chosen skirting the shore of Lochryan. On reaching Stranraer they were entertained to luncheon by the Earl of Stair—Mr. Greig, his lordship's factor, presiding. A vote of thanks to Lord Stair was proposed by Professor Bayley Balfour for the high intellectual treat he had given them. After luncheon the party dispersed, some few remaining to visit Lochnaw Castle, the residence of Sir Henry Agnew, Bart., and Galloway House, the seat of Lord Galloway; the majority taking train to their several destinations, north and south, and all entirely satisfied with their outing, which had been managed by Mr. Moffat, secretary of the Society, without a hitch, and with comfort and pleasure to everyone.

THE MIDLAND COUNTIES CARNATION AND PICOTEE.

SATURDAY, August 8.—The first exhibition of this newly-formed Society was held in the Birmingham Botanical Gardens, and was a marked success in the display of blooms and gathering of well-known cultivators. The southern growers responded generously, and brought a goodly number of flowers, but the northern growers were not in bloom, and the midland flowers are very backward, so that few of them were forthcoming.

In the class for twelve Carnations, Messrs. Thomson & Co., Birmingham, were 1st, with clean good blooms, and this stand included fine blooms of C. H. Herbst, S. B. and S. S. Thomson, two fine new varieties raised here.

For six Carnations.—1st, Mr. Robert Sydenham.

For twelve Picotees.—1st, Mr. E. H. Dodwell, Oxford, with a fine lot, viz., a very superb Norman Carr, Lyddington's Favourite, a new variety; Mrs. Colridge, very fine indeed; Annot Lyle, Little Phil, Imogen, Mrs. Payne, Mrs. Sharp, Nellie, Royal Visit, and John Smith.

In the class for six Picotees, Mr. Robert Sydenham was a good 1st. The yellow ground and fancy Picotees were a most attractive feature, and these beautiful varieties are becoming very popular. In the class for twelve blooms, Mr. Charles Turner was 1st, with a grand lot, and the *Gardeners Magazine* Silver Medal was also awarded to this stand. The varieties were:—*Romulus*, Mrs. Walford—a seedling, Edith, Mrs. Wynne, Apollo, Victory, Almira, Lord Rendlesham, Madame Van Houtte, Countess of Jersey, Distinction, and Mrs. Henwood.

A class for twelve self varieties was well filled, and many beautiful flowers were staged. Mr. Dodwell was 1st, with Germania, the finest yellow known; Queen of the West, and ten seedlings.

In the class for six fancies or selfs, Messrs. Thomson & Co. were 1st, having blooms of their two new fine varieties of A. W. Jones and Blushing Bride.

There were several other classes, all well filled, and the class for twelve border varieties, five blooms of each, had three exhibits, Mr. J. Walker, of Thame, was 1st; and for a bouquet of Carnations and Picotees, Messrs. Thomson & Co. were 1st.

The premier prizes for the best blooms throughout the exhibition were awarded as follows:—Princess Bizarre, Robert Houlgrave, to Messrs. Thomson & Co.; Princess Flake, Thalia, to Mr. C. Turner; Heavy edge Picotee, Mrs. Coldridge, to Mr. Dodwell; light-edged Picotee, Baroness Burdett-Coutts, to Mr. C. Turner; yellow-ground Picotee, Countess of Jersey, to Mr. Turner; Self Carnation, Germania, to Mr. Dodwell.

First-Class Certificates were awarded to Mr. J. Douglas, Ilford, for fancy Picotees, Lily Henwood and Mrs. Robt. Sydenham.

Amongst the honorary exhibits were a fine display of Mr. Eckford's superb new Sweet Pens; a handsome group of plants from Messrs. Thomson & Co.; fancy Pansies from Mr. William Sydenham; new Pansies, and Carnation and Picotee blooms, from Mr. Campbell, Blantyre; a new *Caladium* "Raymond Lemoine," and herbaceous blooms from Messrs. Hewitt & Co.; a fine collection of *Begonia* blooms from Mr. B. R. Davis, Yeovil; *Viola* and *Pansy* blooms and cut herbaceous blooms from Mr. J. Forbes, Ilawick; and a collection of cut herbaceous plants and border Carnations from Messrs. Dicksons, Chester.

CLAY CROSS FLOWER SHOW.

TUESDAY, August 11.—The great feature this year was the groups of plants, each 300 feet, arranged in circular form down the middle of the marquee, with the smaller groups on the sides in semi-circles. The 1st prize was won by Mr. A. Ward, gr. to T. H. Oakes, Esq., Riddings House, Alfreton, with an elevated group, undulating to near the outside of the circle to smaller groups. The centre was composed of Palms, different varieties of Lilies, Crotons, and the graceful *Eulalia variegata*; between the smaller groups were some perfectly-coloured Crotons, and interspersed on the ground-work were fine *Nepenthes*, raised sufficiently to show their grown pitchers; *Cattleyas*, *Cypripediums*, *Odontoglossums*, and *Tuberoses*. Mr. Ward also gained the Silver Medal given by the proprietors of the *Gardeners Magazine* for special culture.

Mr. W. Haslam, Hardstoft, took 1st prize in the smaller 150-foot groups, with a tastefully-arranged lot of plants, closely followed by Mr. Shaw, gr. to W. Turbutt, Esq., Ogston Hall, Chesterfield. One group out of seven in this class was disqualified, the exhibitor having potted up some cut flowers.

The collections of fruit made a splendid show, Black Grapes being especially good. Mr. Goodacre, Mr. Edmunds, Mr. Webb, Mr. Ward, and Mr. Read, were the principal prize-takers.

Roses were well shown by Mr. Proctor, Chesterfield, and Mr. Wilson, Handsworth. Wreaths and bouquets came from Messrs. Pearson, nurserymen, Nottingham. Some very attractive baskets and rustic vases filled with Ferns, for table decoration, were shown by Mr. Edwards, Nottingham. Amateurs and cottagers' classes, displayed in two separate tents, were well filled. A good incentive to cottagers is the great number of prizes given by the Clay Cross Coal Co. in the different parishes within a radius of 6 miles, for the best cultivated gardens.

CARDIFF HORTICULTURAL.

AUGUST 12 AND 13.—This was the third annual show of a reorganised society, and promises to be one of the largest and most popular in the West of England. Several large tents were required to take the contributions, and while in the plant and cut-flower departments there was a decided growth since last year, in the fruit and vegetable departments the increase, both in extent and quality, was something remarkable.

In Division I. were nineteen classes, open to all England. The leading class was for twelve stove and greenhouse plants, and here Mr. J. Lockyer, gr. to J. C. Hanbury, Esq., Pontypool, beat Mr. Jas. Cypher, of Cheltenham, the former staging some very good specimens, chief among them being *Bougainvillea glabra*, *Clerodendron Balfourianum*, *Ixora Pilgrimii*, *I. regina*, *Allamanda grandiflora*, *A. nobilis*, *Dipladenia amabilis*, *Erica obnata purpurea*, *E. Farriana*, *Anthurium Scherzerianum*, &c. Mr. Cypher, who took the 2nd prize, had as his leading specimens, *Ixora Pilgrimii*, *I. Fraseri*, *I. Williamsii*, *Allamanda Hendersoni*, *A. nobilis*, *Erica tricolor major*, &c.

Flowering plants included some very good *Fuchsias*, especially the six specimens which won the 1st prize for Mr. T. Clarke, gr. to Colonel Hill, M.P., Llandaff, who had mainly dark varieties, *Lye's Charming*, *Thomas King*, and *Beacon* being the best. The 2nd prize went to Mr. Thomas Hillard, a shoemaker of

Cardiff. The best varieties shown were Lye's Charming and Lye's Thomas King, and another dark variety named Beacon.

Thomas Hillard was 1st with six very fine plants of zonal Pelargoniums, large, admirably grown and bloomed; the double varieties, Mark Twain in particular being admirable. Begonias were fairly good, but compared with last year an improving feature, and six excellent Achimenes were staged by Mr. Thomas Malpass, Cardiff.

Orchids were represented by four good specimens from Mr. Cypher, the fragrant *Dendrochilum filiforme* diffused a sweet perfume; he also had *Oncidium incurvum*, *Cattleya Gaskelliana*, and *Cypripedium barbatum*.

Groups of plants arranged for effect, with one conspicuous exception, were not so good as they might have been, and as the 1st prize was withheld in the class for the largest, exhibitors will not be slow to take the hint given.

Nine-foliaged plants were very good from Mr. Cypher, his *Croton Thomsoni*, *C. Warreni*, and *C. Countess* were finely-grown and well-coloured. Mr. Hockley, gr. to Col. Page, Cardiff, had the best eight exotic Ferns, a well-coloured example of *Adiantum Farleyense* being prominent. Good table-plants were exhibited, and *Caladiums* also.

In the cut flower classes some fine Roses were shown by the English Fruit Company, Hereford, and the Rev. F. R. Burnside, of the same city. The Tea-scented varieties from the latter were exquisite, and he was 1st with twelve blooms. Messrs. Perkins & Son, Coventry, also had good flowers. Messrs. Heath & Son, nurserymen, Cheltenham, had the best twenty-four Dahlias, and Messrs. Jones & Son, nurserymen, Shrewsbury, were 1st with twelve bunches of Cactus varieties.

Hardy flowers were a very good feature indeed, especially the bunches shown by Messrs. Jones & Son, and Mr. A. Pettigrew, Cardiff Castle gardens.

Annuals were a very pretty feature, and well arranged bunches showed off the subjects to the best advantage.

Quite a large tent was filled with bouquets for bride and drawing-room, wreaths and crosses, with vases and baskets of flowers, and tables laid out for eight persons, and this department of the exhibition promises to become a very important one at Cardiff. The best table came from Messrs. Jones & Son, Shrewsbury; Mr. C. Winstone, The Mall, Clifton, was 2nd.

Fruit was a fine feature. Mr. E. Gill, gr. to W. M. Franklin, Esq., St. Helens, was 1st with six bunches of Grapes, having finely finished examples of Black Hamburg, Golden Queen, Muscat of Alexandria, and Foster's Seedling. There were classes for three bunches of Grapes, a class each for all the leading varieties. Black Hamburg, Muscat of Alexandria, Gros Maroc, Golden Queen, Madresfield Court, and Foster's Seedling were particularly good. Mr. Pettigrew was placed 1st, with two very fine Pines, Melons, collection fruit, dessert and culinary Apples, Peaches, Nectarines, &c., were both plentiful and good.

And the same with the vegetables, and especially so in reference to cottagers' exhibits. Messrs. Sutton & Sons, Reading, and Messrs. Clibran & Son, Manchester, offered special prizes for collections which brought a keen competition.

In the way of miscellaneous contributions, Messrs. Clibran & Sons, florists, Altrincham, had plants, hardy flowers, &c. Messrs. B. S. Williams & Sons, Victoria Nurseries, Holloway, had a collection of plants arranged with excellent effect. Messrs. Dobbie & Son, seedsmen, Rothesay, had a collection of Violas, in bunches, fine African Marigolds, &c. Mr. John Watkins, Pomona Gardens, Hereford, had a collection of Apples, Gooseberries, &c.; and Mr. A. Pettigrew sent from the Castle gardens a collection of forty varieties of Apples, and thirty varieties of Pears, as a contribution to the Fruit Conference.

MAIDENHEAD HORTICULTURAL.

August 13.—The past exhibition was in every respect an excellent one. Great improvements have been made of late years, so that now this show has become a most important country show. The quality of both plants, fruits, and vegetables was first-rate, and in many classes the competition was very keen.

For the large group, Mr. Aitken, gr. to Major Meeking, Richings Park, was 1st, with a well-arranged group, composed of plants suited to the purpose, the flowering part consisting of a good proportion of

light colours, which greatly aided in setting off the bright colours of Crotons and other foliage plants. Mr. Lindsay, gr. to the Duchess of Buccleuch, Ditton Park, was a good 2nd, with not quite such a bright display as his more fortunate rival.

Fuchsias were shown remarkably fine; in fact, it is rare nowadays to see them so good. Mr. Lockie, gr. to G. O. Fitzgerald, Esq., Oakley Court, Windsor, was 1st, with plants of extra size, carrying fine flowers, and in robust health; Mr. Hughes, gr. to H. Paravicini, Esq., Heathfield, Bracknell, was a very close 2nd, the plants full of flower.

For fine-foliage plants in pots, limited to 8 inches diameter, Mr. Lockie was again successful, with a healthy lot, consisting of Crotons, Dracenas, Dieffenbachias, and Palms; Mr. Hughes again coming in 2nd.

For six specimen plants (three foliage, three in flower), Mr. Aitken was 1st, with large well-grown plants, being also 1st for the best specimen in flower, with an excellent *Clerodendron Balfourianum*. The same exhibitor showed six good Ferns, comprising an exceedingly fine plant of *Gymnogramma peruviana argyrophylla*, another of *Davallia fijiensis plumosa*, and *Pteris scaberula*, also in excellent health. Mr. Lindsay was 2nd, with an even lot of plants. For a specimen foliage plant, Mr. Cook, gr. to Mrs. Fitzadam, Windsor was easily 1st, with an immense *Croton Queen Victoria*, finely coloured.

Mr. Lockie was the most successful with table plants, having useful-sized examples, taking also the 1st for half a dozen well-grown dwarf plants of Cockscombs.

Tuberous-rooted Begonias were exceptionally fine, Mr. Lockie again being to the front, the plants in full flower. The same must be said of the plants in another class, from Mr. Lindsay. These latter were the dwarfer of the two.

Zonal Pelargoniums were shown in profuse bloom, the plants dwarf and bushy, from Mr. Aitken, who was a good 1st.

Orchids were not shown in classes, but one plant showed by an amateur grower as a specimen plant deserves particular notice. It was a very healthy example of *Cypripedium Parishii*, from Mr. Silver, Altwood Road, Maidenhead. This plant bore seven spikes, with forty-five flowers, and was growing in a 6-inch pot. It took the 2nd prize in its class.

Cut flowers were not represented by many classes, but these were filled with exhibits. Mr. Walker, Thame, Oxon, was one of the most successful competitors, taking 1sts for Roses, Dahlias, Zanias, and Asters, receiving as prizes two Silver Flora and two Silver Banksian Medals of the Royal Horticultural Society. Of these classes the Roses and Dahlias were the best. Other classes open to amateur growers only, contained some excellent exhibits, in these Mr. Paxton was 1st for Roses, Mr. Wheeler, Halesley, for Dahlias, Mr. Pond, gr. to W. Lang, Esq., Maidenhead, for Quilled Asters; Mr. Hughes for any other kinds, with by far the best exhibits.

Fruit and Vegetables.—These contained some of the best productions in the show, and brought out some very keen competition.

For a collection of six dishes, Mr. Goodman, gr. to Miss Hammersley, Abney House, Borne End, was 1st with a good all-round lot, black Grapes, Nectarines, Plums and Peaches, being some of the best; Mr. Aitken came a close 2nd, having excellent Muscats and Nectarines. Mr. Goodman was also 1st for a collection of outdoor fruits, again showing strongly, Early Rivers Plum, Glastone Apple, Moor Park Apricot, and Doyenne d'Été Pears, being his choice. Mr. Osman, Ostershaw Park, Chertsey, was a near 2nd, showing Peaches and Cherries, very good.

For Grapes there was a close competition. Mr. Marcham, gr. to Miss Arnott, Englefield Green, being 1st with Black Hamburg, the berries and bunches large, the colour good; Mr. Johnston, gr. to A. Gilliat, Esq., Stoke Poges, coming 2nd, taking also the 1st prize for any other black with first-class bunches of Madresfield Court, fine in berry. For Muscat of Alexandria Mr. Osman was an easy winner, with well-finished examples; taking likewise the 1st for any other white kind with Buckland Sweetwater. With Peaches Mr. Johnston won with highly-coloured fruit; and with Nectarines Mr. Paxman held the same position; Mr. Goodman being 2nd in both instances. Mr. Sage, gr. to the Earl of Dysart, Ham House, was 1st for a Pineapple, with a well ripened fruit. In a strong class for Melons, Mr. Aitken took 1st place; and Mr. Lockie the 2nd. Apples, both culinary and dessert, were well shown, Mr. Aitken being 1st for the former, and Mr. Goodman for the latter. Mr. Lockie won for Cucumbers easily, and was very successful in the collection of vegetables,

winning the 1st place for Messrs. Carter & Co., and Webb & Co.'s prizes, showing superior produce. Mr. Wilkins, gr. to Lady Theodora Guest, Hens- tridge, won 1st for Messrs. Sutton's prizes, being also 2nd for Messrs. Carter's. The amateurs show well in this locality, the exhibits being excellent, the same should be said of the cottagers' classes, in which the competition was very keen, the different classes, particularly Potatoes being very well filled.

TAUNTON DEAN HORTICULTURAL.

August 13.—Despite the adverse season, this giant show appeared to be short of but little of its fair proportions; there were, perhaps, fewer specimen plants than we have seen in previous years.

Plants.—As is usual, Mr. James Cypher was to the fore with some of his superb specimens. He had far away the best twelve stove and greenhouse plants in flower, staging a huge *Phenocoma prolifera* Barnesi, *Kalosanthes coccinea*, specially fine in colour; *Ixoras Pilgrimi*, *Régina*, and *Williamsii*, *Bougainvillea glabra*, *Stephanotis floribunda*, *Allamanda grandiflora*, *A. nobilis*, *Statice profusa*, and three good *Ericas*. Mr. Rowland, gr. to W. Brock, Esq., Exeter, was 2nd, his best plants being *Dipladenia Brearleyana*, *Clerodendron Balfourianum*, *Stephanotis floribunda*, *Ixora Prince of Orange* and *Princeps*, &c.

Mr. Cypher also had the best six, *Allamanda nobilis*, *Bougainvillea glabra*, two *Ericas*, and two *Ixoras* making up the number.

In the amateurs' class for twelve plants, foliaged and flowering, Mr. Rowland was 1st, with some fine specimens, such as *Latania borbonica*, *Cycas revoluta*, *Dipladenia amabilis*, *Allamanda Hendersoni*, &c.; Mr. J. Currey, gr. to Col. Pepper, Salisbury, was 2nd.

Orchids were represented by one collection of four plants from Mr. J. Cypher. He had *Epidendrum prismatocarpum*, *Oncidium macranthum*, and *Cattleyas Gaskelliana* and *Sanderiana*. The best newly-introduced plant in flower came also from Mr. Cypher—one of *Cypripedium oenanthum superbum*; and the newly-introduced foliaged plant was *Pteris tremula Smithiana*, also from the same exhibitor.

Begonias have become favourite exhibition plants at Taunton, and they are done well. The best eight in the open class came from Mr. G. Hawkins, gr. to W. H. Fowler, Esq., Taunton.

In the amateurs' division for six single flower specimens, Mr. W. Cuvill, gr. to H. F. Manley, Esq., Bishop's Halt, was 1st; and in that for six double-flowering, Mr. A. Godfrey, West Moulton, was 1st; and Mr. W. H. Fowler, 2nd. Zonal Pelargoniums were very good, large, well-grown and bloomed plants being staged. In the open class, Mr. G. Way, gr. to G. E. Colthurst, Taunton, was placed 1st, with six singles also with four double-flowered; and he was also 1st in the amateurs' class for six plants. Mr. S. Bruford, gr. to Mrs. Hancock, Hales, being 1st, with four double varieties.

Fuchsias were not so good as usual, though they are always shown so finely at Bath, on the other side of the county; but Cockscombs, Petunias, Balsams, Gloxinias, Achimenes, &c., were generally well done, and made pretty patches of colour. Lilies were a good feature, shown as single plants and as collections of four; the white form of *L. speciosum* preponderating.

Groups.—There were two classes for groups of plants arranged for effect, and in each case the 1st prize was taken by Mr. J. Currey, gr. to Col. Pepper, Salisbury, who has made great headway as a decorator.

Foliage plants were well represented by 1st prize eight from Mr. James Cypher. He has, as is usual, richly-coloured Crotons, the old *angustifolius* being finely shown; *Keotia Fosteriana* and *Belmoreana* *Cycas revoluta*, *Latania borbonica*, &c.; Mr. J. Curry was 2nd. In the amateurs' division, Mr. Rowland came 1st with similar subjects to the foregoing. Exotic Ferns were presented by a good collection from Mr. J. Lloyd, gr. to Vincent Stuckey, Esq., Langport, who had fine bold specimens, *Pteris umbrosus*, *Adiantum grandiceps*, and *Davallia Mooreana*, being the most noticeable; and Mr. Rowland was 2nd. Mr. Curry was 1st with six plants.

There was but one collection of hardy Ferns—a very good one—from Mr. Huxtable, gr. to F. W. Newton, Esq., Barton Grange; and Mr. Huxtable was 1st also with four exotic mosses.

Despite the late season, the cut flowers were yet a good feature. The best forty-eight Roses came from Messrs. Perkins & Son, nurserymen, Coventry, a

very good lot, the deep-coloured flowers being very bright; and Dr. S. P. Budd, Bath, was 2nd. Messrs. Perkins & Son were the only exhibitors of twenty-four varieties, three trusses of each, showing very good flowers in this class also. In the amateurs' division, Dr. Budd was 1st with twenty-four blooms, twelve blooms, and twelve Teas, all very good; and to these three collections the judges awarded the *Gardeners' Magazine* Medal for special excellence in culture. Mr. Thomas Hobbs, Lower Euston, Bristol, and Mr. W. H. Fowler also showed good blooms.

Dahlias were not so numerous as usual. In the open class, Mr. Thomas Hobbs won the 1st prize with a clean and well-finished dozen; Mr. Joseph Nation, Staplegrove, was 2nd; while the latter was the only exhibitor of twelve fancy Dahlias. No single flowers were forthcoming, but the Cactus varieties were shown by Messrs. Nation and Fowler. Asters were numerous, especially the flat-petalled varieties. Gladioli were very fine. Mr. W. H. Fowler, Taunton, is an amateur grower of high skill. He was placed 1st, with a very fine stand of twenty-four spikes, and also with six; Mr. H. Godding was 2nd in the former class. Carnations and Picotees were fairly well shown, and cut blooms of Begonias, both double and single, were of fine quality.

The best stands of twelve and six bunches of stove and greenhouse cut flowers came from Mr. W. Iggulden, gr. to the Earl of Cork, Marston, Frome. Hardy flowers in bold bunches were finely shown by Mr. A. A. Walters, nurseryman, Bath; and Mr. R. H. Poynter, in the open class; and by Mr. J. Cording, gr. to Dr. F. H. Moad, Bishop's Lydeard; and Mr. W. E. Hall, Yeovil, in the amateur's division. Special prizes were offered by Mr. B. R. Davis, nurseryman, Yeovil; and Mr. R. H. Poynter, for their strains of Begonias.

Fruit made a very fine feature, being both numerous and good. The best twelve dishes came from Mr. W. Iggulden, who had excellent Madresfield Court and Foster's Seedling Grapes, Sea Eagle Peach, Lord Napier Nectarine, Shipley Apricot, Oullin's Golden Gage Plum, Smooth Cayenne Pine, Brown Turkey Fig, Golden Gem Melon, &c.; 2nd, Mr. James Lloyd, with Madresfield Court and Muscat of Alexandria Grapes, the latter unripe; Queen Pie, Dymond Peach, Pine-apple Nectarine, Moor Park Apricot, &c.

The best four dishes came from Mr. J. Brutton, Yeovil, who had good Black Humbergh Grapes, Dymond Peaches, Pine-apple Nectarine, and Hero of Lockinge Melon; 2nd, Mr. W. Iggulden, who had Muscat of Alexandria Grapes, Grosse Mignonne Peaches, Stanwick Nectarine, and Melon.

The best three bunches of Black Humbergh Grapes came from Mr. C. Warden, The Gardens, Clarendon Park, Salisbury, who had excellent fruit; Mr. Iggulden being 2nd. The best three bunches of any other black were Madresfield Court, finely finished, from Mr. W. Duffurn, gr. to D. Cox, Esq., Weston-super-Mare; Mr. Iggulden being 2nd. Mr. Connelly, gr. to J. R. C. Talbot, Esq., Lyme Regis, had the best three bunches of Muscat of Alexandria; Mr. J. Lloyd was 2nd. The best three bunches of any other white were those of finely-finished Buckland Sweetwater, from Mr. C. Warden; Mr. T. Crossman, gr. to Earl Poulett, Chippenham, was 2nd with the same. The best Melon was Sutton's Monarch, from Mr. A. Turner; Mr. J. Lloyd came 2nd with Hero of Lockinge. Mr. J. Brutton had the best dish of Peaches, staging very fine Dymond; Mr. Iggulden coming 2nd with Sea Eagle. Mr. R. Huxtable, gr. to F. W. Newton, Esq., had the best dish of Apricots in Smith's Large Early; Mr. Iggulden being 2nd with Moor Park. Mr. Brutton was 1st with Nectarine, having fine Pineapples; Mr. Duffurn coming 2nd with Elruge.

The best dessert Pear was Jargonelle, some good fruit being shown by Messrs. Duffurn and Brutton. The best light-coloured Plum was a very fine Oullin's Gage from Mr. Brutton; and he had also the best dark-coloured in Duke of Wellington; Mr. Iggulden coming 2nd with De Montfort. The best Cherries were Governor Wood and Morello; the best dessert Apples, Beauty of Bath and White Astrachan; the best kitchen Apples, Lord Sulfield, Eckliaville, and Hawthornden. Currants of all colours and Gooseberries were very fine.

Vegetables were a remarkable feature, and not less fine were those shown by cottagers. The fertile vale of Taunton produces these in perfection, and the Potatos were especially clean, bright, and of the finest quality in appearance. Special prizes were offered for vegetables by Messrs. Jarman & Co., seedsmen, Chard, Messrs. E. Webb & Sons, seedsmen, Stourbridge, and Messrs. Sutton & Sons,

seedsmen, Reading. Very fine vegetables were shown, but the competition was decidedly the keenest in the case of Messrs. Sutton's prizes. Mr. Henry Moore, Minehead, won the 1st prize in this, and also in Messrs. Webb & Sons' classes. He also had the best six dishes of Potatos, twelve tubers of each, staging superb examples of The Dean, Reading Russet, Satisfaction, Magnum Bonum, Purple Perfection, and Abundance. Mr. J. Greedy, gr. to Major Birton, came 2nd, with a very fine collection also, having Schoolmaster, The Dean, Satisfaction, Prizetaker, Cosmopolitan, and Windsor Castle. Mr. H. Moore had the best dish of a round Potato, showing The Dean, King of Russets; Mr. H. F. Manley was 2nd. The best white Potato was Abundance, also from Mr. H. Moore. Parsnips, Celery, Cauliflower, Carrots, Turnips, Peas, Beans, &c., were wonderfully fine and numerous throughout the show.

Table decorations, bouquets, &c., quite filled a tent. The best arranged table was set up by Mr. James Cypher, in that charming style for which he is so famous. Mrs. Macalister, Taunton, was 2nd. Mr. Cypher also had the best stand or vase, admirably done; and Mr. Thomas Meakin, Clifton, was 2nd. Mrs. Lee, of Taunton, had the best hand-bouquet, Messrs. Perkins & Son taking the 2nd prize. Pretty stands of wild flowers were shown by Miss Jones, Taunton, and Mrs. Macalister; also bouquets of wild flowers and button-holes.

Contributions of plants and flowers, not for competition, were made by Messrs. Kelway & Son, nurserymen, Langport, who had a superb lot of spikes of Gladioli and other cut flowers; by Messrs. R. Veitch & Son, Nurserymen, Exeter, who had plants and cut flowers; a very interesting contribution by Messrs. J. Jarman & Co., seedsmen, Chard, who had plants and a large assortment of cut flowers; and by Mr. B. R. Davis, seedsmen, Yeovil, who had a fine lot of his prize strain of Begonias. All the foregoing were highly commended, and Certificates of Merit awarded to Messrs. Kelway & Son for Gladioli Lord Wolseley, brilliant crimson, and A. G. Swinburne, primrose-blush and pink.

NATIONAL CO-OPERATIVE FLOWER SHOW AND FESTIVAL, CRYSTAL PALACE.

AUGUST 15.—The flower show was but one element of this annual festival, but it was a very important and conspicuous one. As it draws exhibitors from all parts of England and Wales, it is not to be wondered at that nearly 4500 entries were made, and 500 tables, 8 feet long, were required to accommodate the exhibits. The flower show filled the whole of the eastern part of the nave, but in many parts of the building something was going on relative of the festival, and in the grounds of the Palace also. The task of arranging all these exhibits was a very onerous one, but it was well carried out by Mr. G. Waugh and a staff of assistants; Mr. E. Owen Greening, the Managing Director of the Horticultural and Agricultural Association, taking a general oversight of all the engagements of the day. The schedule of prizes, which included some 251 classes, was divided into two main sections, from one of which all professional gardeners were excluded, and the competition confined to working people only; in the other, gardeners, if members of industrial societies, or their employers, members of the horticultural and agricultural associations, were able to compete. Bearing in mind that it is only six years since the first co-operative flower show was held, the conservatory of the Royal Horticultural Society at South Kensington sufficing to take the exhibits, it is remarkable how rapid it has grown in extent, and still more in the quality of the productions. At the first show the exhibitors had a very elementary knowledge of quality in garden productions of all kinds—even the gardeners who were among the exhibitors from the very first; but they have been quick to learn, and we can say that the quality of the exhibits generally which were staged at the Crystal Palace on Saturday was worthy of any exhibition held throughout the country, and it is obvious that the cultivators of vegetables and flowers are keenly alive to the necessity of growing the very best strains. It was noticed more particularly this year that the competition becomes keener in the leading classes as the quality improves, and it was no easy task to select from thirty to fifty dishes of Peas or Potatos, Beans, Carrots, &c.; five worthy awards, where the average merit is so good.

Some of the most trying work judges have experienced was got through on Saturday last, and on

the whole the awards appeared to give great satisfaction.

Plants are, of necessity, one of the smallest features. Vegetables, flowers, and hardy fruits, can be brought safely from long distances if carefully packed; not so plants. Hence they come from points near to the place of meeting; but they improve if not over large. Such a display of annuals has perhaps never before been seen at the Palace, and the most attractive among the bunches were the Sweet Peas; even Mr. Eckford's new varieties were present. African Marigolds were magnificent; and the number of cut Roses shown, as well as their general good quality, testified to the lateness of the Rose season.

Hardy fruits were a great feature, especially the Gooseberries and Currants; and in the gardeners' class for six dishes of fruit, very good Grapes, Peaches, &c., were staged.

Potatos were beautifully clean and bright, and while large generally, yet very handsome. In the Potato, Carrot, Pea, Runner Bean, and Onion classes, there was a close run among numerous aspirants to honours.

The best collection of farm produce, fruits, vegetables, plants, and flowers, arranged as a trophy, came from the Royal Arsenal Co-operative Society, at Woolwich—in every way highly creditable; Mr. T. Osman taking the 2nd award.

That this annual exhibition is leading many of the working-classes to take an interest in their gardens cannot be doubted. That surely is good, looked at from any point of view; and if they can be led to take an interest in and associate themselves with self-governing industrial enterprises, in the management of which they can assist, and share in any pecuniary advantages derived therefrom, surely the good is augmented, and the community benefited. The movement is on the side of industry, sobriety, self-reliance, and thrift, and, as such, it seems to be deserving of every encouragement.

NATIONAL CHRYSANTHEMUM.

A MEETING of the committee took place on the 17th inst., at Auderton's Hotel, Fleet Street, Mr. Robert Ballantine in the chair. The Secretary announced that he had received notice of the death, in May last, in the 71st year of his age, of Mr. Nicholas J. Bott, formerly so intimately connected with the culture of the Chrysanthemum. A letter was read from Mr. H. Briscoe-Ironside, of Sidcup, resigning his seats on the General, the Floral, and the Catalogue Revision Committees of the Society, having, through failing health, been ordered abroad. The Secretary was instructed to convey to Mr. Briscoe-Ironside the great regret of the committee at his resignation, and their hearty sympathy with him in his illness. The vacancy on the General Committee was filled up by the appointment of Mr. J. Williams, on the Floral Committee, by Mr. Norman Davis; and Mr. Taylor to the Catalogue Revising Committee. The Secretary announced that he had made arrangements for a conference on Chrysanthemum sports, to take place in connection with the exhibition at the Royal Aquarium in November next, and that the Rev. Professor Henslow, M.A., would deal with the question from the botanist's, and Mr. Norman Davis from the cultivator's point of view. It was resolved that the conference take place on the first day, November 10, at six o'clock in the evening, and cultivators were requested to send as many sports as possible, and the varieties from which they had originated, to the conference meeting. The Evesham Chrysanthemum Society and the St. John's Gardeners, Amateurs', and Cottagers' Society were admitted into affiliation, and fifteen new members were elected, including one fellow. The secretary reported there were now 72 Fellows of the Society, 651 ordinary members, and 83 affiliated societies.

SHREWSBURY.

AUGUST 19 AND 20.—This celebrated Society held its annual exhibition of plants, fruits, vegetables, and flowers, on the above dates, and may be pronounced as the best hitherto held by the Society, the entries exceeding 2500 this year.

The show was held in The Quarry, the beautiful grounds of the Shropshire Floral and Horticultural Society. The attendance of visitors was exceedingly good. Want of space prevents us giving more than a brief notice of this excellent show, and therefore many praiseworthy exhibits, including a grandly flowered lot of zonal Pelargoniums, cannot be noticed

in detail. The following is a synopsis of the leading exhibits, which were all admirably staged.

Plants.—In the class for sixteen stove and greenhouse plants Mr. Finch, gr. to James Marriott, Esq., Coventry, and Mr. Cypher, Cheltenham, were placed equal 1st. In Mr. Finch's collection was shown the finest plant of *Ixora Dullii* hitherto seen here, having seventeen trusses of its bright orange-red flowers, about nine inches in diameter; also a fine plant of *Sobralia macrantha*, having seventeen well-developed flower spikes and plenty of healthy foliage; and splendid plants of *Kentia Fosteriana*, *Stephanotis floribunda*, and *Allamanda Hendersonii*. Mr. Cypher's best plants were *Cycas circinalis*, *Croton Queen Victoria*, of great size and fine colour; *Latania borbonica*, *Phaenocoma prolifera Barnesii*, grandly-flowered; and *Ixora regina*.

In the class for six flowering plants, Mr. Finch was 1st, staging good plants of *Ixoras*, &c.

Ferns.—1st, Mr. Roberts, gr. to C. H. Wright, Esq., Oswestry, with a fine half-dozen plants, among which may be mentioned *Microlepia hirta cristata* and *Davallia Mooreana*.

Groups.—These were arranged differently from what one usually meets with at shows—a series of mounds, composed of Maidenhair Ferns, various kinds of Orchids and bright foliage plants, with a Palm in the centre of each, the ground between being covered with moss and dwarf foliage plants, the background consisting of a good bank of Palms, Crotons, Lilies, *Masdevallias*, &c., Mr. P. Blair, gr. to the Duke of Sutherland, securing 1st in the leading class, and 2nd in another. Mr. A. Webb, gr. to J. H. M. Sutton, Esq., Newark-on-Trent, was 2nd in the principal group.

Fruit.—A fine show. Out of four collections of twelve kinds staged, Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, Derby, was a good 1st, showing good Black Hamburg, Barbarossa, Muscat of Alexandria, and Foster's Seedlings Grapes, two bunches of each, extra fine Lord Napier Nectarines, Barrington Peaches, Countess Melon, Brown Turkey Figs, Moor Park Apricots, Kirk's Plums, Queen Pine, and Circassian Cherry, a good all-round lot.

Five good collections of nine kinds were staged, Mr. H. E. Kennedy, gr. to Sir C. H. Rouse Boughton, Bart., Ludlow, being 1st. His collection included a dish of Frogmore Pine Strawberry and good Pine-apple Nectarine.

Grapes.—These, on the whole, were deficient in colour. Out of seven stands of black, six bunches in three varieties, two bunches of each, Mr. Bannerman, gr. to Lord Bagot, Battlefield, Rugeley, was 1st, staging good bunches of Alnwick Seedling, Black Alicante, and Black Hamburg; 2nd, Mr. J. Baker, gr. to J. W. Raynes, Esq., Rock Ferry; 3rd, Mr. Iggulden, gr. to the Earl of Cork, Marston House, Frome.

Eleven stands of Black Hamburg, three bunches on each.—Mr. J. Langley, gr. to Rev. Bulkeley Owen, Tedsmore Hall, was a good 2nd, showing large, well-coloured bunches.

Eight stands were shown in the any other black class. Mr. Crawford, gr. to Jas. Thorpe, Esq., Codrington Hall, Newark-on-Trent, was 1st, with grand bunches of Black Alicante. Four bunches of white, in two varieties: Mr. Middleton, gr. to R. Pillington, Esq., Rainford Hall, Birkenhead, was 1st with good bunches of Muscat of Alexandria and Foster's Seedling. With three bunches of Muscat of Alexandria, Mr. Middleton was 1st out of six stands put up, showing handsome solid bunches of a good colour, and large in berry. Any other white Grape, Mr. Iggulden was 1st out of ten lots staged, with Foster's Seedling; Mr. Goodacre being 2nd. Out of eight stands of Black Hamburgs, Mr. Langley was 1st, staging large, well-finished bunches. Any other black than Hamburg, Mr. Pearce, gr. to S. K. Mainwaring, Esq., was 1st, with fine examples of Gros Maroc; eight lots being staged. Finest specimen of black Grape, Mr. J. Crawford was 1st, with a good bunch of Barbarossa—6 lb.

Peaches were largely represented, Mr. Iggulden being 1st, with large fruits of Sea Eagle.

Vegetables.—Seven good collections of twelve kinds were staged, Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood House, Blandford, was 1st, his Lyon Leek, Ailsa Craig Onion, Satisfaction Potato, new Intermediate Carrots, Perfection Tomato, green Artichokes, and Duke of Albany Pea, were his best dishes; Mr. Waite, gr. to Col. Talbot, Glenhurst, being 2nd, with a good all-round lot.

Potatoes.—Out of seven collections of six varieties, six tubers of each, Mr. Combes, gr. to the Earl of

Dudley, was 1st, showing fine specimens of Windsor Castle, Early White Beauty, Cole's Favourite, Sutton's Abundance, Edgemoor Purple, and Satisfaction. Mr. Waite had the best three dishes, in a good competition, of Pride of Ontario, Queen of the Valley, and Sutton's Seedling.

Tomatos.—Out of nine dishes staged, Mr. J. Squibbs, Gresford, Derbyshire, was 1st, with Perfection.

Peas.—Thirty dishes of Peas were staged, Mr. A. E. Payne, Wellington, being 1st, with good examples of Duke of Albany.

Onions.—Mr. Wilkins was 1st, in a good competition, with Ailsa Craig, spring-sown. Mr. Waite being 1st, with autumn sown, showing Lemon Rocca.

Cut Flowers were shown in large quantities. Messrs. Perkins & Sons, of Coventry, being 1st, in a strong competition, choice Orchids, *Pancreatums*, &c., being used in most of the arrangements.

Roses.—Several good stands of twenty-four blooms were put up. 1st, Messrs. Perkins & Sons, in whose collection the Earl of Dufferin, Her Majesty, Niphetos, Mrs. John Laing, and Harrison Weir were conspicuous.

REPORTS OF THE FOLLOWING SOCIETIES HAVE BEEN RECEIVED.

National Carnation Society, Old Trafford; Langcliff and Stainforth Cottagers' Horticultural Society; Marton Horticultural and Industrial Society; Crick Flower Show; Denley Flower Show; Bovey Tracey Cottage Garden Society; Boulevard Amateur Horticultural Society, Radford, Scorton and District Floral and Horticultural Society; Malmesbury Flower Show; Arlington and District Horticultural Show; Shirehampton Flower Show; Pdirig Amateur Floral Society; Pollokshields Society; Stirling Park Gardens Horticultural Society; Wilts Horticultural; Moor Park.

TRADE NOTICE.

THE AFFAIRS OF MESSRS. HOOPER & CO.

This firm, which carried on business many years in Covent Garden and Maida Vale as seed and horticultural manufacturers and merchants, was formed into a company in 1886, with a nominal capital of £100,000, and was ordered to be wound up in May. Under the winding-up order, the summary of accounts, &c., has just been issued by the provisional liquidator, and shows gross liabilities £19,601, with assets disclosing a surplus of £1,234. The contributories' deficiency is £25,347 10s. It appears that the Maida Vale Nurseries were purchased in 1887, the purchase-money for the whole being £23,640, of which £6,640 was paid in cash. The liabilities were satisfied by the vendors, and the business was carried on at the Central Avenue and the Piazza, Covent Garden, at 83, Regent Street, the Maida Vale Nurseries, and at Paris. The failure is attributed to the expenses having exceeded profits, and to loss by the purchase of stock at Maida Vale. From the deficiency account it appears that the expenses have been £16,958, salaries, &c. £3,307, and miscellaneous expenses £10,819; loss on Paris trading, £1,108; and depreciation of property, £8,406. At present a receiver is acting on behalf of the debenture-holders.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

STAFF REQUIRED.—Will you kindly ask one or two of your able contributors to give the labour required to keep the following sized garden in decent order:—There are 2 acres of kitchen garden, 1 acre enclosed within the walls, which are covered with the usual supply of fruit trees, and about the same outside, cropped with vegetables. Flower borders in kitchen garden for a good supply of cut flowers, &c. There are three vineries, Peach, Fig, and Tomato-houses, and a good supply of pits and frames. These are a quarter of a mile from the mansion. Near the mansion-house there is a conservatory, stove and forcing house, fully 1½ acres of

grass, including two tennis greens and mathematical flower garden, consisting of thirty-six good-sized beds, walks, &c. *A Perplexed Gardener.*

CACTUS.—Will any reader give a few hints as to the best method of getting these plants to bloom. Should they be kept in a moist or dry heat? They seem to bloom them at Kew easily. Do they bloom every year? *Epiphyllum.*

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 1. Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending August 15, is furnished from the Meteorological Office:—

"The weather has continued in an unsettled condition very generally. Heavy rain has fallen in the more north-western and northern parts of the Kingdom; but, in the south and east of England, the rain has been comparatively slight, and several fair intervals have been experienced. Thunderstorms occurred in many parts of the Kingdom on the 10th.

"The temperature has not differed materially from the mean. The highest of the maxima, which were recorded on irregular dates in Ireland and Scotland, and on the 14th over England, varied from 77° in 'England, S.', and 76° in 'England, E.', to 67° in 'England, N.W.', and 64° in 'Scotland, N.' The lowest of the minima were registered in most places on the 11th, and ranged from 42° in the north and east of Scotland, to 50° in 'Scotland, W.' and 'Ireland, N.', and to 56° in the 'Channel Islands.'

"The rainfall has been less than the mean in 'England, E.', the 'Midland Counties,' 'England, S.', and also in 'Ireland, S.', and equal to it in 'Scotland, E.', 'England, N.E.', and 'England, S.W.'; in the other districts a somewhat decided excess is shown. A very heavy fall is reported to have occurred in some parts of Lancashire, between the 13th and 14th.

"The bright sunshine has been less than the mean in all districts, except 'England, N.E.' The percentage of the possible amount of duration ranged from 35° in 'England, S.W.', and 33° in 'England, S.', to 21° in 'Ireland, N.', and 14° in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, August 20.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

HEAVY supplies of hard goods to hand, prices ruling low. Kent Filberts in good supply. James Webber, Wholesale Apple Market.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Asters, Bouvardia, Carnations, etc.) and prices in s.d. and s. d. formats.

ORCHID-BLOOM in variety.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing various plants in pots (Aralia Sieboldi, Aspidistra, etc.) and their prices.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing various vegetables (Artichokes, Beans, Beet, Carrots, etc.) and their prices.

POTATOS.—The end of last week's trade was a very bad one. Many parcels had to be cleared at 35s. to 45s. per ton, and those not sold have since been disposed of for cattle use, being so badly diseased. The orders to stop sending this week has had the effect of shortening supplies, with an upward tendency in prices for sound parcels. During the next month markets are likely to be unsteady. Best samples 70s. to 80s. J. B. Thomas.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing various fruits (Apples, Currants, Gooseberries, etc.) and their prices.

FRUITS AND VEGETABLES.

BOROUGH: Aug. 12.—Quotations.—Cabbages, 2s. 6d. to 4s. 6d. per tally; Onions, 2s. 6d. to 3s. per dozen bunches, and 4s. 6d. to 5s. per cwt.; Carrots, 2s. to 2s. 6d.; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; Marrows, 6d. to 1s. per dozen; Peas, 2s. to 3s. per bushel, and 3s. to 5s. per bag; Scarlet Beans, 2s. 6d.; French Beans, 2s. to 2s. 6d. per 12 lb. Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, 1s. 6d. to 2s. 6d. do.; Parsley, 1s. to 2s. do.; Horseradish, 12s. to 14s. per dozen bundles; Cos Lettuce, 4d. to 8d. per score; Eodive, 1s. to 1s. 6d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Beetroot, 3d. to 6d. per dozen roots; English Apples, 1s. 6d. to 3s. 6d. per dozen bushels; Gooseberries, 2s. 3d. to 3s. per half-sieve; Green Gages, 2s. 9d. to 3s. 9d. per flat; Orleans Plums, 3s. per half-sieve; Red Currants, 3s. to 3s. 6d. do.; Black do., 7s. 6d. to 8s. do.; Black Cherries, 4s. to 5s. do.; Raspberries, 37s. 6d. to 40s. per cwt.; English Tomatoes, 3s. to 6s. per 12 lb.

SPITALFIELDS: Aug. 18.—French Beans, 2s. 6d. to 3s. per bushel; Scarlet do., 3s. to 4s. do.; Peas, 3s. to 4s. per sack; Cabbages, 2s. to 4s. per tally; Marrows, 9d. to 1s. 3d. per dozen; Broad Beans, 1s. per bushel.

STRATFORD: August 18.—There has been a good supply of all kinds of produce at this market during the past week, and a fair trade was done at the undermentioned prices:—Cabbages, 3s. to 5s. per tally; Carrots, household, 1s. 6d. to 2s. 6d. per dozen bunches; Mangels, 30s. to 34s. per ton; Onions, Egyptian, 100s. to 110s. do.; do., Oporto, 6s. to 7s. per case; Apples, English, 3s. to 7s. per bushel; Scarlet Beans, 4s. to 5s. per sieve; French Beans, 3s. to 4s. do.; Windsor Beans, 2s. 3d. to 2s. 6d. do.; Red Currants, 3s. to 4s. 6d. per half-sieve; Black Currants, 7s. to 7s. 6d. do.; Plums, 2s. to 3s. 9d. do.; Marrows, 3s. to 5s. per tally.

NOTICES TO CORRESPONDENTS.

ADDRESS WANTED.—Will Mr. H. ALCOCK, late of 35, Ordish Street, Burton-on-Trent, kindly furnish his present address?

ADVERTISEMENTS: E. A. M. Unless you give us more details we cannot answer your question.

APPLE LEAVES: G. B. The fungus on your leaves is the same that causes Apples to crack on the surface. The Americans are using sulphate of copper in fine powder or solution, but we have no experience as to its value in this disease.

BOOKS: F. G. M. Oliver's Lessons, Masters' Botany for Beginners (Bradbury, Agnew, & Co.), or Edmond's Elementary Botany. Read Darwin's Works; do not attempt to learn the natural orders without specimens in hand; start with British plants, first looking over the descriptions given in British Flora.—A. E. Epitome of Gardening (Black & Co.), is suitable for an amateur gardener.

BUSH CHRYSANTHEMUM BUDS: Amateur. If the plants upon which buds have already formed belong to the Japanese family and are late flowering kinds, such as Boule d'Or, Grandiflora, or Etoile de Lyon, for instance, I would advise that they be retained, except they have had their buds set for two or three weeks. All plants belonging to this family should have their buds left now. Should any of the medium or early-flowered kinds have set their buds, they should be removed, the shoots disbudded to one on a branch, and wait for the next bud. The same remark applies equally to the incurved section. From this date onwards, any buds which form of any variety should be retained. Promptly remove all growths which cluster around the buds and down the stem, which will concentrate the whole energy of the plant into the few selected flower buds. E. Molyneux.

CHRYSANTHEMUM BUDS: A. S. The centre bud is what is known most generally as the "crown" bud, being placed in the centre of the young shoots, which spring from the base of the flower-bud. In the case of the Japanese family, if large exhibition blooms are required, "crown" buds which form at this time are the best for producing them, and also many of the incurved section succeed best from that bud. In fact, all do north of London; but south of that point, "crown" buds forming during the early part of this month are too early to give the best results in the "Queen" family. In that case remove the bud and all shoots but one, and wait until another bud is formed. E. Molyneux.

FLOWER SHOWS: Anxious. It is impossible to report all of these, or even to give full accounts of any but the most important. We have before us as we write, notes of more than fifty such Shows held last week alone.

GRAPES: Hortus, Wales.—Your Muscat Grapes are very fair samples—might be better set; more heat at the time of setting is most likely required. There are some spider outlives, which would account for some of the rusty appearance. Have you syringed them? Your Black Hamburgs are, no doubt, overcropped. Dress them in the autumn with good fresh loam and Thomson's Manure.—Subscriber. The berries you have sent us are curiously damaged, as if by mildew, but we are not quite sure of this, and will examine them more fully.

GRAPES NOT COLOURING: A. Cox. Judging from your statement, and the samples sent us, which are quite ripe and sweetly flavoured, the failure we should attribute to the maintenance of a too close

and warm atmosphere during the colouring period. Give more air night and day, keeping the piping warm to promote circulation—a much lower temperature would suit better; also give more water, much more, we should say, than a quarter of a gallon per foot. You should read Vines and Vine Culture, if you have not done so.

Ivy: A Subscriber. Ivy cuttings may be put in now in shady places; pieces with roots do better, but they will succeed without.

NAMES OF FRUITS: M. J. 1, Sea Eagle; 3, Warrington; 5, Whitesmith; 6, Porcupine; other fruits unfortunately smashed. We have no note of any other parcel being received.—C. K. It is somewhat too early to name late Apples with any degree of certainty. Their characters are not yet fully developed. Of those sent, No. 1 may be Gloria Muodi, No. 2 Warner's King, No. 3 Beauty of Kent; others cannot be recognised.

NAMES OF PLANTS: Erectus, 1, Laurelia aromatica; 3, Eucryphia pinnatifolia; 5, Cephalotaxus Fortunei; 8 or 9, Eugenia apiculata; 10, Myrtus sp. We cannot identify more from the species sent. Send better specimens.—W. D. H. Sparganium ramosum.—A. E. R. 1, Centranthus ruber; 2, Lysimachia vulgaris; 3, not recognised.—Bedale, 1, Veratrum nigrum; 2, Lysimachia vulgaris; 3, not recognised.—E. C. C. D. Populus alba, or one of its varieties.—W. Higgin. Potentilla fruticosa.—J. E. Pernetty mucronata.—A. G. L. 1, Thuia occidentalis var.; 2, T. o. var. plicata; 3, Retinospora plumosa; 4, R. pisifera; 5, Juniperus virginiana.—J. W. Pittosporum tenuifolium.—G. W. J. 2, Ficus Parcelli; 3, Pilea muscosa; 4, Begonia fuchsoides; 5, Dipteracanthus affinis, probably—send when in flower; 6, Begonia metallica (incarnata); 7, Begonia, garden variety; 8, Bomaria Carderi; 9, Trachelospermum jasminoides; 10, Anthericum lineare variegatum.—Subscriber, 1, Campanula isophylla; 2, Yucca aloefolia variegata; 3, Francoa appendiculata; 4, Begonia argyrostigma.—R. P. Zephyranthes atamasco.—J. H. Hedychium Gardnerianum.—T. H. E. 1, Sedum spectabile; 2, Helianthemum vulgare, var. Fireball; 4, Veronica spicata variegata; 3, next week.

NEW PEAS: C. Sharpe & Co. A dwarf Pea of compact habit, with about eight or nine large, well-coloured Peas in each pod. The variety seems very productive, but the flavour of the sample sent is only fair.

ONION FLY: A Subscriber. Your Onions are attacked by the maggots of the Onion fly (Anthomyia ceparum). Take up the whole of the infested plants at once with a knife or spud, and burn them. Try soft-soap suds to destroy any maggots which may remain. In winter, trench the ground two spits deep, so as to bury the chrysalids, as the fly cannot reach the surface if deeply buried.

RASPBERRIES: W. Wilson. There are several sorts of Raspberries which fruit in the way you describe. Belle de Fontenay may be named as one. It is well worth growing.

SECOND FLOWERING OF APPLES: Westmorland. Not uncommon. The flowers are produced on the shoots of the year, as in a Rose. A similar thing happens in Laburnum and many other plants.

THE STOTT

SPECIALTIES for DESTRUCTION OF INSECT PESTS.

PATENT DISTRIBUTOR.

Letter received from The Earl of Lisburne
S. Wales, June 29, 1890.
Sir,—Am very well pleased with the Distributor; it does its
work well, and is a most useful invention.—Yours faithfully,
LISBURN.

PATENT SPRAYER.

Extract from letter from Mr. G. Norman, Gardener to
The Right Hon. The MARQUIS OF SALISBURY.
The Gardens, Hatfield House, Herts, April 20, 1891.
SIR,—I am pleased to report that I consider your Distributor
a very useful invention.

PATENT SYRINGE.

Extract from letter from R. White, Esq., Ardarruch,
Gareloch Head, Dumbartonshire.
July 20, 1891.
I consider the Syringe bought from you one of the cheapest
and best I ever had. It is especially good for spraying Odontoglossums.

KILLMRIGHT.

Extract from letter from Mr. J. Young, Head Gardener to
the Zoological Society, Regent's Park, London.
July 22, 1891.
It is the best Insecticide I have ever used, and the cheapest.

FEEDMRIGHT.

Extract from Letter from Mr. T. Wise, Gardener to
F. TAYLOR, Esq., Ash Lawn, Heaton, Bolton.
September 20, 1890.
Your Patent Manure has given us every satisfaction.

FOR PLANTS.

QUICK. LASTING. ECONOMICAL.

The Gardens, Seacroft Heath, Hawkhurst, Kent, March 11, 1891.
DEAR SIR—Having used your "Clay's Invigorator" for some
time, I am exceedingly pleased with the results obtained from
it. As an Exhibitor I have used it upon most sorts of Vege-
tables with great advantage; also upon many sorts of Stove
and Greenhouse Plants, Melons, Cucumbers, Tomatos, Pot
Strawberries, Chrysanthemums, &c. For Lawns it has a quick
and beneficial effect. For Amateurs and those with small
gardens, where there is a difficulty in obtaining stable or farm-
yard manure, your "Invigorator" ought to be of special value,
as it is clean in use, easy of application, and reasonable in
price.—Yours respectfully, J. GILMOUR, Gardener to the
Right Hon. G. J. GOSCHEN, M.P.

Sold by Seedsmen, Florists, and Nurserymen, or direct from the
Works, in 6d. and 1s. Packets, and SEALED BAGS:—
7 lbs. 14 lbs. 28 lbs. 56 lbs. 112 lbs.
2s. 6d. 4s. 6d. 7s. 6d. 12s. 6d. 20s.

The above Trade Mark is printed on every Packet and Bag,
and also impressed on the Lead Seal attached to the mouth
of each Bag.

A SAMPLE PACKET will be sent post-free on receipt of
ONE SHILLING by the MANUFACTURER—

S. C. CLAY,

Marsh Island, Stratford New Town, London, E.

Must be good Salesman and used to growing for Market, as he will be required to make the same pay.—Apply, wages, &c., by letter, to JOHN SHAW, Landscape Gardener, Bawdon, Cheshire.

WANTED, a GARDENER, where a boy is kept. Must be thorough both as to Flowers and Vegetables. Abstainer preferred. Wife must be able to take Laundry.—Apply by letter to Mrs. COLLINSON, Hatfield, Herts.

WANTED, a steady MAN, as SECOND GARDENER, married, to take charge of Glass, and assist outside. Must have a good knowledge of Vines and Plant-growing. Abstainer preferred. Wages, 18s. per week, cottage, and garden.—Apply, H. HATCH, Farnhurst, Cowden, Kent.

WANTED, a good ROSE-BUDDER, for a few thousand stocks.—State particulars to GEO. BOLTON, Buntingford, Herts.

WANTED, a young MAN, not under 22, as SECOND GARDENER. Must be well up in his work, both Indoors and Out.—Apply to H. HOWELL, Fredville Park, near Dover.

WANTED IMMEDIATELY, a thorough good CARNATION GROWER. State age, experience, &c.—Address GARDENER, Loudwater House, Rickmansworth, Herts.

WANTED, shortly, a first-class WORKING FOREMAN.—Well up in Growing Grapes, Flowers, Cucumbers, Tomatos, Ferns, &c., for Market. Good wages will be paid to a steady, reliable man.—Address, with reference, wages, &c., F. M., 47, Hart Street, Covent Garden, W.C.

WANTED, a practical Man as WORKING FOREMAN, SALE-MAN, PROPAGATOR, &c. Must have thorough knowledge and experience. State age, wages expected, where trained and last employed, to THOS. STEAD & SON, Holly Nurseries, Bold, near Warrington.

WANTED, for private place, where part produce is sold, a young MAN, as FOREMAN, under Glass, two under him, and in Rothy. Character for steadiness and industry, with some knowledge in Orchids. Wages, 17s. weekly.—HEAD GARDENER, Whitfield, near Hereford.

WANTED, a first-class WORKING FOREMAN, thoroughly competent to grow quantities of Choice Flowers, Plants, &c., for Market; also Cucumbers, Tomatos, Melons, &c., with a good knowledge of Nursery Work. Applicants must have filled similar positions before, and be capable of managing a place. Total abstainer preferred.—Apply, with refer. wages, and salary required, E. GRIFFIN AND CO., 1, Queen Street, Cardiff.

WANTED, AT ONCE, young MAN for the Houses. One that has some knowledge of Orchids, and could undertake the Sale of Cut Flowers.—J. PREWETT, Swiss Nursery, Hammermith, W.

WANTED, a young MAN in a Market Nursery, used to Tomatos, Cucumbers, &c., to work under a Foreman.—Apply, by letter, to LOMBARA, Post Office, Hextable, near Swanley, Kent.

WANTED a young MAN (Scotchman preferred), for Out-door Work, with experience of Strawberries and Tomatos under Glass. State age.—R. TURNER, Northbourne Abbey, Deal.

WANTED, a young MAN, in a Nursery. Must understand Propagating soft-wooded Plants. Wages, 15s., with rise if suitable.—Apply, 192, Haverstock Hill, N.

WANTED, a sharp, active young MAN. Must be quick at Potting, and careful at Watering. 1s. per week.—State age, with references, to TURNER BROS., Florists, Garston, Liverpool.

WANTED, a MAN thoroughly acquainted with all kinds of Forcing in Houses, for Market purposes.—Apply, J. P., West Hall, Mortlake.

WANTED, an ASSISTANT SHOPMAN, for a good Provincial house. One with some knowledge of Plants preferred. State age, experience, and salary expected.—H. C., Messrs. Nutting & Sons, 105, Southwark Street, London, S.E.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first-rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

STEPHEN CASTLE, F.R.H.S., has on his List, among others, a HEAD GARDENER of thorough good reputation, with high-class characters, which will bear strict investigation. Full particulars on application.—Ashford Vineyard, Fordingbridge, Salisbury.

GARDENER (HEAD), and ORCHID GROWER.—Age 31; seventeen years' experience in Orchids, Stove and Greenhouse Plants, early and late forcing, hardy Fruit, Flower, and Kitchen Gardens.—WILLIAM LAKE, Quorn Lodge, Loughborough, Leicestershire.

GARDENER (HEAD).—Particulars of Advertiser, nearly nine years in present appointment. With testimonials, three in number, on application. Staying until engaged.—ROBERT NELSON, Hawthorn, Ravenstonedale.

GARDENER (HEAD).—Middle-age; energetic. Skilled all round, including Decorations. A successful Grower of Choice Fruits, Flowers, Vegetables, Orchids, &c. Had the management of twelve Houses, Large Garden. A Gentleman recommends.—GARDENER, 29, Oxford Terrace, West Norwood, S.E.

GARDENER (HEAD).—Age 30, married when suited; fifteen years' experience in all branches of the profession. Midland Counties preferred. Excellent testimonials.—ASHWELL, Bedford Road, Murlinger, Sandy, Bedfordshire.

GARDENER (HEAD), where one or two Under ones (or more) are kept.—Age 29, married.—Mr. PLUMTRE recommends his Second Gardener (of five). Nearly six years here. Thoroughly knows his work.—Freyville, near Dover.

GARDENER (HEAD).—J. B. JONES, Head Gardener to Sir Robert Allcock, Bart., Ditham Hall, Newmarket, and previously Head Gardener over twelve years to T. J. Provis, Esq., J.P., late of The Grange, Elbowme, Salop, desires a re-employment to any Nobleman, Lady, or Gentleman. Disengaged early in September. Please address as above, with all particulars.

GARDENER (HEAD); age 41.—Experienced in all branches, including early and late forcing and management of good establishment. Five years' recommendation.—F. W., 13, Castle Street, Hertford.

GARDENER (HEAD).—A Gentleman wishes to recommend a Head Gardener, age 41, who has been in his employ for the last fifteen years. Well up in forcing Fruit, Flowers, Vegetables, Orchids, Stove and Greenhouse plants, &c.—Apply, in first instance, to E. S., 29, Argyle Road, Bognor.

GARDENER (HEAD WORKING), married, two children, (youngest age 12); thoroughly experienced in Early and Late Forcing, &c. Highest references from present and former employers.—T. W., 7, Ellingham Road, Reigate.

GARDENER (HEAD WORKING).—Age 36, married; twenty years' experience in Stove and Greenhouse Plants, Flower and Kitchen Gardens, Early and Late Forcing. Leaving through change in establishment. Good characters.—B. S., Croxley, Rickmansworth.

GARDENER (HEAD WORKING). Age 39, married; a thoroughly good, practical, and competent Gardener. Twenty-three years' experience in Growing Grapes, Peaches, Figs, Melons, Cucumbers, Mushrooms, Tomatos, Stove and Greenhouse Plants, Flower and Kitchen Gardening, Orchids; Early and Late Forcing. Abstainer. Highest references.—GARDENER, Oakwood, Chichester, Sussex.

GARDENER (HEAD WORKING), or good general FOREMAN; age 18.—Mr. FRISD, gardener to the Hon. P. C. Glyn, Rookwood, Godstone, can confidently recommend a thorough practical man as above; fourteen years' experience, including Orchids and Chrysanthemums for exhibition.

GARDENER (HEAD WORKING).—Age 28; married, no family. Sixteen years' practical experience in all branches. Excellent character.—A. C., Melway Villa, Paddock Wood, Kent.

GARDENER (HEAD WORKING).—Age 50; thoroughly practical in all branches, and character will bear strict investigation.—A. B., 59, Faulkner Street, Bishopsfields, Chester.

GARDENER (HEAD WORKING).—Age 32, married. Seventeen years' experience in Stove, Greenhouse, and Flower and Kitchen gardening. Seven years and nine months in last situation. Good characters from last and previous employers.—SAUNDERS, Cul-de-Sac Road, Molesey, Surrey.

GARDENER (HEAD WORKING, or SINGLE-HANDED).—Age 32; married, two children; seventeen years' experience; three years' good character from present situation, seven previous.—GARDENER, Trentham, Finsworth, Hants.

GARDENER (HEAD WORKING), or would not object to a good SINGLE-HANDED place.—Age 19, married, two children; practical knowledge of his work both inside and out. Can have good references, and he well recommended as a hard-working, trustworthy man.—WOOD, Holmeborough, Redhill.

GARDENER (HEAD WORKING).—Age 33, married; nineteen years' practical experience in the growth of Fruit, Flowers, and Vegetables. Indoors and Out. Seven years in present situation as Head. Excellent character.—G. L., 2, Weston Cottages, Lembroke Road, New Southgate.

GARDENER (HEAD WORKING).—Age 30, married, one child (1 year); abstainer. Life experience in Peaches, Melons, Cucumbers, Tomatos, Mushrooms, Stove and Greenhouse Plants, Flower Gardens, Chrysanthemums, &c. Kitchen Garden a specialty, and Early and Late Forcing. Excellent references as to ability and trustworthiness.—GARDENER, Little Brickhill Manor, Blechley, Bucks.

GARDENER (WORKING).—Age 36, married; twenty years' experience in Glass, Fruit, Flowers, and Vegetables; Land and Stock, if required. Six years' good character from present situation.—A. SMITH, 24, Egin Terrace, Maida Vale, London, N.W.

GARDENER (SINGLE-HANDED).—Age 29, married, one child; abstainer. Understands Vines, Melons, &c., and the general routine of Gardening. Excellent references.—H. GREEN, Culworth, Banbury.

GARDENER (good SINGLE-HANDED, or with assistance).—Situation wanted as above next month; highest reference. Wife thorough Landlady, if required.—C. H. Wickin, Newport, Essex.

GARDENER, good.—Age 44; understands his duties. Could manage Land, Stock, and Poultry. Wife good Landlady.—JAMES CARLTON, New Town, Hatfield, Herts.

GARDENER (Scotch); age 29.—W. MACKAY can highly recommend a thorough good practical man as above; fourteen years' experience; first-class testimonials.—69, South Audley Street, Grosvenor Square, W.

GARDENER, where assistance is given.—Middle age; married, no family. Thorough in all branches; upwards of four years in last situation.—E. B., 1, Bath Cottages, Eastworth, Chertsey.

GARDENER (SECOND), where three or four are kept.—Age 23, single; eight years' experience Inside and Out. Good character.—W. BROWN, Colley Cottage, Reigate Heath, Surrey.

GARDENER (SECOND), or FOREMAN, in a good establishment.—Age 4, single. Both preferred. First-class references from past and present employers.—STEPHEN MALLETT, Morpeth House gardens, H. Wick.

GARDENER (UNDER).—Age 22; five years' experience, Inside and Out, and can have five years' references, if required.—H. YOUNG, Bulsey Road, Winton, Bournemouth, Hants.

GARDENER (UNDER), in a Gentleman's Establishment.—Age 23; can be well recommended. Eight years' experience Inside and Out. Good character.—W. BROWN, Colley Cottage, Reigate Heath, Surrey.

GARDENER (UNDER, or SINGLE-HANDED), where there is no Glass; no objection to a small Greenhouse.—Single; highest references.—M. JERMY, Eaton Croft, Newmarket Road, Norwich.

To Nurserymen and Others.

MANAGER, or FOREMAN, in a small Nursery, or as MARKET GROWER, where a steady, reliable man, interested in his work, is required.—Age 39, married. South preferred.—W., 15, Elm Park Road, Oxford Road, Reading.

NURSERY MANAGER.—Many years' practical knowledge in leading Nurseries. Would take occasional journey, if required. First-class references from late employers.—ORCHS, The Vineyards, Garston, Liverpool.

Market Growers.

MANAGER.—Well up in Tea Roses, Ferns, Cut Flowers, Grapes, Tomatos, Cucumbers, &c., in quantity for Market. Twenty years' experience. Good references.—ALPHA, 1, Grove Road, Upper Mitcham, S.W.

PROPAGATOR and GROWER.—Well up in Pelargoniums, Cyclamen, Fuchsias, Primulas, Calceolarias, Cinerarias, Genetsas, Hydrangeas, Bonvardias, Ficus, Ferns, and General Market Plants, Vines, Tomatos, Cucumbers, Forcing Lily of Valley, Balbs, &c. Good reference.—H. GARDENERS' Chronicle Office, 11, Wellington Street, Strand, W.C.

PROPAGATOR and GROWER.—Twelve years' experience, several years in leading London nurseries. First-class references.—W. H. CHAPLIN, 35, Stamford Road, Finsham, London, S.W.

PROPAGATOR and GROWER for Market.—All Soft-wooded Stuff, Cut Flowers, Tomatos, and Cucumbers. No objection to take charge of a Branch Nursery.—FOREMAN, Ashford Nursery, Staines.

FOREMAN; age 25.—O. CATTING, The Gardens, Bayfordbury, Hertford, will be very pleased to recommend a young man, as above. Pains-taking and trustworthy; two and a half years in present situation.

FOREMAN and GROWER.—Age 30; fifteen years' experience in Fruit and Plant Culture, Cut Flowers, &c. Highly recommended from good firms for ability and industry.—R. E., 15, Narcissus Road, West Hampstead, N.W.

To Nurserymen.

FOREMAN, PROPAGATOR, or ORCHID GROWER.—Thoroughly experienced. Excellent references.—E. A., Messrs. W. H. Smith & Son's Bookstall, Waltham Cross Station.

To Nurserymen and Florists.

FOREMAN.—Age 30, married.—Advertiser seeks re-employment as above. Good all-round Trade Experience. Knowledge of Bulbs, Seeds, &c. Good at Wreaths, Bouquets, and General Furnishing. Good references.—A. R., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

FOREMAN, in a Market Nursery, under Glass.—Well up in Carnations, Roses, Gardenias, Cucumbers, Tomatos, Strawberries, and Soft-wooded Plants.—A. B., Lock Road Cottage, Ham Common, Surrey.

JOURNEYMAN.—Age 22; seven years in good Fruit Establishment. Can be well recommended.—H. HOLMES, Manor Nursery, Normandy, Guildford.

JOURNEYMAN, under a Foreman, in a private place.—Experience in general work and Fruit forcing. Well up in picking.—HEAD GARDENER, Whitfield, near Hereford.

JOURNEYMAN.—Age 23; good references.—T. MOORE, Post Office, Crimbleham, Downham Market.

JOURNEYMAN, in the Houses.—Age 22. Good character. Eight years' experience. Both preferred.—J. P., Mr. Miller, 3, Roman Road, Frenchwood, Preston.

JOURNEYMAN, Inside and Out, or Outside.—Age 21; seven years' experience; good character.—W. D., 94, Olinada Road, Stamford Hill, N.

JOURNEYMAN (FIRST-CLASS), in a leading Nursery.—A German Gardener, 21 years of age, well up both Inside and Out, six years' experience (twelve months in England), seeks a situation as above; in or near London preferred. Best testimonials; strong, willing, and pains-taking.—G. S., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

IMPROVER.—Age 22; seven years previous experience, Inside and Out, under Head Gardener; well recommended.—SCHURE, care of Mr. Hawkins, Weington Road, Itkley, Yorks.

To Gardeners.

IMPROVER.—Age 18; three years' experience in Nursery; abstainer; good reference.—ERNEST, 9, Custom Street, Victoria Dock Road, E.

IMPROVER, or SECOND, under Glass.—Age 12; four and a half years' good character from present employer. No objection to pay premium.—S. POPELLE, 160, Oldbury Road West, Smethwick.

IMPROVER, in the Houses.—Age 18. Market or private. Five years' experience. Good character.—C. FOX, The First, Lambly, Notts.

TO GARDENERS and OTHERS.—Situation wanted for a young man (18) in good private Garden. Three years' excellent character from a Nursery.—"PONICA," Steorvale Nursery, Christchurch, Hants.

TO GARDENERS.—C. SUTTON, Gardener to the Right Hon. Earl Stanhope, Chevening Park, Sevenoaks, Kent, wishes to recommend a youth (age 16). Twelve months' experience. Premium given.

TO NURSERYMEN, &c.—Situation wanted in a Market Nursery; well to Palm-, Ferns, Carnations, and general soft-wooded stuff; age 21; seven years' experience.—G. H. L., Gardeners' Chronicle Office, 11, Wellington Street, Strand, W.C.

TO NURSERYMEN.—Situation wanted by a young Man (age 20) in a Market Nursery. State wages, &c.—B. BIGGS, 53, Tauton Road, Lee, S.E.

WOODMAN, or to make himself useful in a Nursery or Kitchen Garden. Wife good Landlady, No family. Ten years last situation.—J. BARNFIELD, Brownsea Island, Poole, Dorset.

COWMAN.—A GENTLEMAN wishes to recommend middle-aged married man. Height, 5 feet 9 inches. Thoroughly understands Stock.—D. ALCOCK, French's Nursery, Cumberwell Green.

SHOPMAN, or MANAGER.—Age 32; thorough knowledge of Seed, Bulb, Plant, and Flower Trade. Good references. State particulars.—W. HARRIS, Hammerwood, E. St. Grinstead, Sussex.

SHOPMAN.—Age 30; seventeen years' experience. Thorough knowledge of Seed, Bulb, and Plant Trade.—ELDER, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (ASSISTANT).—Age 25; good knowledge of the trade in all branches. Good references.—J. H., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

CLERK.—Accustomed to Bookkeeping, &c.; many years in the Nursery and Seed Trade Offices; good references.—J. F., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

To Nurserymen, &c.

CLERK (age 32) desires situation, where the services of a thoroughly competent and reliable Clerk are required. Long experience. Highest references.—ALPHA, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S OINTMENT and PILLS.—RHEUMATISM and NEURALGIA.—Though the former disease more especially attacks persons of all ages, and the latter ruthlessly selects its victims from the weak and delicate, the persevering use of these remedies will infallibly cure both complaints. After the affected parts have been diligently fringed with hot brine, and the skin thoroughly dried, Holloway's Ointment must be rubbed in firmly and evenly for ten minutes twice a day, and his Pills taken according to the printed directions wrapped round each box of his medicine. Both Ointment and Pills are accompanied by instructions designed for the public at large, and no invalid who attentively reads them can now be at any loss how to doctor himself successfully.

EXHIBITIONS.

CRYSTAL PALACE, GREAT FRUIT EXHIBITION, SEPTEMBER 4 and 5, 1891. For Schedules and Entry Forms apply to Mr. W. G. HEAD, Superintendent, Gardens Department, Crystal Palace, S.E. Entries close on August 28.

GLASGOW and WEST of SCOTLAND HORTICULTURAL SOCIETY. GRAND AUTUMN SHOW, St. Andrew's Hall, Glasgow, on WEDNESDAY, September 2, 1891. Prize Schedules may be obtained from any of the Directors, from CHARLES MACDONALD WILLIAMSON, Treasurer, 194, West George Street, Glasgow, or from FRANK GIBB DOUGALL, Secretary, 167, Caning Street, Glasgow.

BRIGHTON HORTICULTURAL ASSOCIATION. GRAND AUTUMN SHOW of PLANTS, CUT FLOWERS, and FRUITS, September 9 and 10. TWENTY POUNDS offered for EIGHT STOVE and GREENHOUSE PLANTS, in flower. Schedules may be had of E. CARPENTER, Secretary, 96, St. James Street, Brighton.

1892—The Summer Show Schedule will include Classes for Stove and Greenhouse and Fine Foliaged Plants, Pelargoniums, Ericas, &c.

NATIONAL CHRYSANTHEMUM SOCIETY, ROYAL AQUARIUM, WESTMINSTER, S.W. EXHIBITION OF EARLY CHRYSANTHEMUMS, DAHLIAS, GLADIOLI, &c., WEDNESDAY and THURSDAY, SEPT. 9 and 10. Schedules of Prices, and all information, to be had of—RICHARD DEAN, Secretary, Ranelagh Road, Ealing, W.

BRADFORD CHRYSANTHEMUM SHOW, NOVEMBER 6 and 7, 1891. Schedules post free. GEO. R. TAYLOR, 102, Godwin Street, Bradford.

LEEDS PAXTON SOCIETY'S CHRYSANTHEMUM SHOW. Schedules now ready, and may be had on application to the Secretary, JAS. SMITH, Asket Hill, Leeds.

THE TOWER FURNISHING COMPANY (Limited), SUPPLY GOODS ON HIRE, direct from the Manufacturers; one, two, or three years' Credit without Security. Purchasers have the choice of 100 Wholesale Houses. Call or write for Prospectus. Address, SECRETARY, 43, Great Tower Street, E.C.

J. WEEKS and CO., HORTICULTURAL ENGINEERS to Her Majesty, H.R.H. the Prince of Wales, H.M. Government Admiralty Department, War Department, Royal Horticultural Society, Royal Botanic Society, Parks, and Public Buildings. Patentees of the Duplex Upright Tubular Boilers. King's Road, Chelsea, S.W.

Landscaping Gardening. ARTHUR M. KETTLEWELL (Author of 'The Theory and Practice of Landscape Gardening'), brings experienced and careful personal attention to the artistic arrangement of Ornamental Grounds, Parks, Gardens, &c. Excellent testimonials from former patrons. Address, Titley, R.S.O., Herefordshire.

Royal Parks, &c.—Grass Seeds. THE COMMISSIONERS of H.M. WORKS, &c., are prepared to receive TENDERS for the SUPPLY of GRASS SEEDS for use in the Royal Parks, &c., during the year 1892. Forms of Tender, containing full particulars, may be obtained at this Office, any day except Saturday, between the hours of 12 and 3.

Tenders are to be delivered before 12 o'clock, Noon, on TUESDAY the 8th proximo, addressed to THE SECRETARY, H.M. Office of Works, 12, Whitehall Place, London, S.W., and enclosed, "Tender for Grass Seeds, Royal Parks, &c." The Commissioners do not bind themselves to accept the lowest or any tender.

H. W. PRIMROSE, Secretary. H.M. Office of Works, &c., 12, Whitehall Place, S.W. August 19, 1891.

FOR ORCHIDS, and GARDENERS to Grow Them, apply to SANDER'S, St. Albans. The finest stock of Orchids in the World. 30 minutes from St. Pancras.

E. D. PYNART VAN GEERT, NURSERYMAN, Ghent, Belgium. AZALEAS CAMELLIAS, RHODODENDRONS, CLIVEIAS, PALMS, FERNS, ORCHIDS, and all other best stuff for the Trade. Apply for the SPECIAL PRICE LIST.

Azaleas, Camellias, Rhododendrons, Palms, ORCHIDS, &c.—AT LOW PRICES. PLANTS GROWN SPECIALLY FOR ENGLISH TRADE.

C. VUYLSTEKE, Nurseryman, Loachristy, Ghent, Belgium. Wholesale CATALOGUE now ready, and may be had free, of—Messrs. R. SILBERRAD and SON, 25, Savage Gardens, Crutched Friars, London, E.C.

Dutch, Cape, and Exotic Bulbs.

ANT. ROOZEN and SON'S CATALOGUE for Autumn, 1891, containing details of their immense Collections of New, Rare, and Fine Bulbs and Plants (104 pages in English) is now ready, and will, as usual, be sent, post-free, on application to their Agents, Messrs. MERTENS and CO., 3, Cross Lane, St. Mary-at-Hill, London, E.C.; or themselves direct, at Oudeveer, near Haarlem, Holland. N.B.—No connection with any other firm of the same name.

MARLY LILAC
 (Well Padded).
 The best of all for Forcing. Thousands
 for Disposal.

CROUX ET FILS,

SEEDLING PLANTS

OF CHOICE

Florists' Flowers.

We have much pleasure in offering the following in Strong, Healthy, Transplanted Young Stuff, from our superb strains.

Free by Post, at prices quoted.		Per Doz. s. d.
Auriculas, Alpine , very choice strong young plants, for blooming next season	2 6
Calceolarias, herbaceous , splendid strain	2 6
Carnations and Picotees , from choicest named flowers per 100, 1 s. 6d.	1 6
Cinerarias , large-flowered, very fine, per 100	10s. 6d.	1 6
Hollyhocks , choicest double 6 for 2s.	3 6
Primulas, Alba magnifica , Splendid Pure White	3 6
" Crimson King , deep Crimson, magnificent colour 6 for 2s.	3 6
" Choicest Red, White, or Mixed , per 100	10s. 6d.	1 6
Hyacinths, Early White Roman , fine selected bulbs Per 100, 1s. 6d.	1 6
Narcissus, paper White 7s. 6d.	1 0
" New large-flowered 10s. 6d.	1 6
" Double Romau 7s. 6d.	1 0
Lilium Harrisii , fine bulbs 5s. 0d.	7 6
" Extra fine 8s. 0d.	10 6

Primulas, double Pure White, splendid for furnishing an abundance of Cut Flowers throughout the Autumn and Winter. Well rooted, strong young plants, from 3-inch pots. Per 100, 42s.; per dozen, 6s.; 3 for 1s. 9d.

Our Fine Illustrated CATALOGUE of DUTCH and other FLOWER ROOTS, NEW and CHOICE ROSES, FRUIT TREES, &c., should be read by all intending purchasers before Ordering. Post-free, 3d., or Gratis to Customers.

DANIELS' BROS.,
TOWN CLOSE NURSERIES, NORWICH.

DUTCH and CAPE BULBS and PLANTS,
DIRECT FROM THE GROWERS AT
GROWERS' PRICES.

ROOZEN BROTHERS,
OVERVEEN, HAARLEM, HOLLAND.

Delivered entirely free in Aberdeen, Belfast, Bristol, Cardiff, Cork, Dover, Dublin, Edinburgh, Glasgow, Gloucester, Gool, Grangemouth, Greenock, Grimsby, Guernsey, Harwich, Hull, Isle of Man, Leith, Limerick, Liverpool, London, Londonderry, Middlesbrough, Newcastle-on-Tyne, Plymouth, Portsmouth, Southampton, or any other port in direct communication with Rotterdam or Amsterdam.

Orders over £2 10s sent free to destination to any place in England, Scotland, or Ireland. Club (Joint) Orders for the same amount also delivered free to destination. No charge for packing or packages.

Full particulars of our enormous Collection of Bulbs, with List of splendid Novelties, will be found in our NEW LIST for 1891, eighty-eight pages in English, which will be sent to all applicants, post-free.

ROOZEN BROTHERS,
OVERVEEN, HAARLEM, HOLLAND.

TWO GRAND NOVELTIES.

A PURE WHITE BEDDING CLEMATIS, and the **FERN** which has lately received so many of the highest awards and proofs of admiration.

CLEMATIS SMITH'S SNOW-WHITE JACKMANII.—The flowers are paper-white, about the same size as those of the old purple Jackmanii, but produced in even greater profusion. It is unrivalled for beds, and also for climbing. Ready in August. 7s. 6d. each.

PTERIS TREMULA SMITHIANA.—This is a very valuable and distinct Fern. No Collection should be without it. Illustration and description free. 5s. to 10s. 6d. each.

BULBS.—The best procurable.

STRAWBERRIES.—All leading kinds. Descriptive LISTS free.

Also all the best varieties of **CLEMATIS** ready for planting out.

RICHARD SMITH & Co.,
Nurserymen and Seed Merchants,
WORCESTER.

EDINBURGH II.

In our next number will be published a series of brief Notes on the Objects of Interest to Gardeners in and about Edinburgh, together with Illustrations, for the use of intending Visitors to the

GREAT INTERNATIONAL FRUIT and FLOWER SHOW,

To be held in the Waverley Market, September 9, 10, 11,

In the following week will also be published a Report of the Exhibition, together with

Numerous Portraits of the Officials of the

ROYAL CALEDONIAN HORTICULTURAL SOCIETY, including that of the President.

The Most Noble the **MARQUIS of LOTHIAN K.T.**

As a large extra circulation of these numbers is anticipated, they will be excellent mediums for advertising. Advertisers should communicate at once with **Mr. A. G. MARTIN**, the Publisher, 41, Wellington Street, Covent Garden, W.C.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 29, 1891.

WOOLPITS.

ONE of the most charming walks in Surrey is to start at Gomshall, from the range of hills striking east and west between Dorking and Guildford, and going almost due south through Peaslake. Passing over the next line of hills to Ewhurst and Cranleigh, at a point just west of Holmbury Hill, we come close to the site of Sir Henry Doulton's new house, Woolpits, which is now complete, and possesses interest for both architects and the public as the work of Messrs. Ernest George & Peto, and as the residence of a great director of English industry.

The road passes by the half-timbered entrance lodge, which has a beautiful outlook to the south-west, from which the carriage-drive winds up to the site of the mansion, which is on a piece of level ground on the hillside. The view from the windows, looking down the valley and over the long stretch of level country to the South Downs, is beautiful. On the right, the view is bounded by the steep ascent of a fir-covered hill, on the side of which Woolpits is built; and, on the left, rises Holmbury Hill, also well wooded. On the further side of the road, and rising partly up the hill of Holmbury, are extensive ornamental grounds and a lake.

The lake is connected with the grounds by two walks, one leaving the house at its south-eastern corner, crossing the park and the public road by a steep descent, with sets of wooden steps; the other passing from the main entrance through a wooded hollow, on the opposite side of the road, to a different side of the lake. After skirting the water, and crossing over two rustic bridges, a branch walk descends the embankment at the lower end, and leads into the road, which gives access to Woolpits Wood. This sheet of water has been formed in a valley within sight of the house.

The enclosure has been planted with masses of Rhododendrons and other shrubs, whose flowers and forms are reflected pleasingly in the water. A shelter or summer-house, with a beautiful prospect over the lake and park, with its masses of old trees, has been constructed over the boathouse, and is itself decidedly picturesque. The beautiful situation of Woolpits can be fully appreciated from this side. The two best views of the house are one from the carriage-drive.

north-east, and one from the side of the hill to the south-west. A branch road from the carriage-drive to the right leads to the stables and coachman's cottage, supported by a bold mass of old Oaks. This is the nucleus of a plantation, which extends thence along the northern boundary, and completes the needful shelter and enclosure. A continuation of the stable road conducts to the back of the kitchen garden, which is walled on three sides, and fenced by a Holly hedge on the south. It abuts closely to the stables, being shut off from the carriage-drive by a sufficient breadth of shrubbery. A favourable position for Roses occurs in a border to the south of the garden; and the walks on entering the kitchen garden at both ends are spanned by Rose arches.

The spot where the kitchen garden stands is a fairly level one, being almost the only bit of flat ground on the property. There is a range of glasshouses against the north wall, with garden sheds in the rear; and supplementary forcing-houses and pits further behind. At the time of writing, November 20, there were two houses—which are used for Cucumbers, Melons, and Tomatos in the summer—filled with a fine collection of winter-flowering zonal Pelargoniums, one blaze of colour of very fine trusses of flowers.

By permission of Sir Henry, the houses and grounds are occasionally thrown open to the people of the neighbourhood. The houses are in autumn very gay with Chrysanthemums, &c. A quantity are grown in 32 and 48-pots, for house and table decoration from 1 to 2 feet in height, and prove to be most useful where exhibition blooms are not required.

Besides the somewhat uncommon gathering of herbaceous plants, there is a fine collection of trees and shrubs, comprising nearly everything that is really worthy of cultivation that will stand the climate in the grounds, Rhododendrons, Hollies in great variety, ornamental Thorns, elegant flowers, graceful forms, and striking foliage being freely intermingled. Roses and other climbers grow on the walls of the mansion, cottages, and buildings.

The southern part of Woolpits Wood, sloping to the west, and looking out into a charming country, has been planted with a collection of Conifers, with clusters of Birch and other deciduous trees, the standard trees being chiefly Oaks. From this part of the Woolpits estate, and looking east, we see the well known Leith Hill, about four miles away, said to be the only eminence from which St. Paul's Cathedral and the sea are both visible. A noted landmark on the Downs is the Chanclebury, or Chanctonbury, ring which was set out by Mr. Charles Goring of Wiston, in 1760. He lived to record in verse the success of his plantation in 1828. To the left is Shoreham Gap, through which, under favourable atmospheric conditions, the sea is discernible. By passing round the ends of the two half-encircling hills, an expanse of country with other hills in the west becomes immediately visible, while there is really no limit to the many happy aspects which travelling a few yards in almost any direction may not develop.

The house (see fig. 30, p. 245), built of red brick and cream-coloured terra-cotta facings, is all the more picturesque, because, although on high ground, it is backed up by higher hills and woods from every leading point of view, and this takes away much of its appearance of newness.

The grounds were laid out by the late Edward Kemp, of Birkenhead. Although he had then retired from the active pursuit of his profession, it was as a mark of personal regard and friendship that Mr. Kemp in 1854 undertook to lay out

and develop the beautiful estate of Woolpits, in Surrey.

In 1886, Sir Henry Doulton secured the services of Mr. H. W. Perrin to take charge of the gardens and grounds generally.

ORCHID NOTES AND GLEANINGS.

CATASETUM CILIATUM.

This elegant little *Catasetum* has just flowered, probably for the first time in Europe, in the collection of M. Robinow, Esq., Hawthornden, Palatine Road, Didsbury. It has recently been imported from the Amazon district. The species was described by Rodriguez (*Gen. et Sp. Orch. Nov.*, i, p. 130), with which description I have succeeded in identifying it. It belongs to the section Pseudo-Catasetum, but is very distinct from *C. roseo-album*, its nearest ally. The sepals and petals are greenish-white, the former reflexed, the latter erect and larger. The lip is triangular, acute, and concave; whitish, tipped with deep maroon-purple, with purple bristle-like hairs half an inch long on the sides near the base, and with light purple transverse lines on its basal half. The pedicels and short column are purplish, the latter without antennæ, as in this section. The flowers, which are just over an inch across, are remarkably like some peculiar bees on the wing. According to Rodriguez, it is a native of Parí, and grows on the Palm, *Mauritia armata*.

ODONTOGLOSSUM WATTIANUM.

This handsome *Odontoglossum* has already improved on becoming established, as an eight-flowered raceme has been received through Messrs. Veitch, of Chelsea, with flowers fully $3\frac{1}{4}$ inches across their broadest diameter. The sepals and petals are yellow, the former with large, the latter with smaller chocolate blotches. The lip is lemon-yellow, with a large purple blotch in front of the nearly white crest, and numerous similar spots on the stalk and basal half of the subpandurate limb. The column and stalk of the lip are each 8 lines long, and form an angle of 45° with each other. It is wonderfully distinct; indeed, its exact affinity is still doubtful, and probably is the finest species which has appeared since the advent of *O. Harryanum*.

DENDROBIUM STREBLOCEAS VAR. ROSSIANA.

A variety of this remarkable *Dendrobium*, in which the lip is wholly white, appeared soon after the introduction of the typical form, and received the above name from Professor Reichenbach. It has considerably improved on becoming established, for Madame E. Gibez, Sens, Yonne, France, now sends a raceme bearing seven of its remarkable flowers. The under-part of the undulate sepals is green, as are also the spirally-twisted petals. These latter are very curious. They are erect, quite parallel, $2\frac{1}{2}$ inches long, and have precisely the appearance of a pair of twisted horns, as the name implies. The species is closely allied to *D. stratiotes*, and equally attractive. The flowers remain several weeks in perfection.

SORRALIA LOWII.

This species closely resembles a dwarf form of *S. sessilis*, Lindl., except that the flowers are of a uniform bright purple, or rose-purple shade. What appears to be the same thing has just been received through Messrs. James Veitch & Sons, of Chelsea, though it is even dwarfer than before, flowering on a stem under 10 inches high. The fugitive flowers of this genus often coupled with a rather tall habit, has, to some extent, affected their popularity as garden plants, though travellers are unanimous in praising their charms as seen in a wild state. The present species is sufficiently dwarf, brightly-coloured, and floriferous to be worthy of attention. At present few plants are known.

CATASETUM NASO ♀.

On two or three occasions a plant of *Catasetum Naso* at Kew has produced a raceme of its singular

male flowers, whose general appearance may be readily seen by a glance at t. 4792 of the *Botanical Magazine*. This year it varies its proceedings in a very interesting way, by the production of a female raceme. Perhaps it is only called a raceme by courtesy, for the single flower now expanded has absorbed all the nutriment, leaving a number of bracts and abortive buds above it. It is, however, a case of the greatest interest. The flower is about as large as in the other sex, light green, the sepals and petals three-quarters of an inch broad, and the lip an inch in diameter, with a narrow purple margin, and a few teeth. This organ is superior, as in every other known case; and, of course, the column is very short, without antennæ, and, like the ovary, very stout. One such flower appeared at Syon House, when the above-cited plate was prepared, and is represented by Mr. Fitch in the original drawing, but omitted in the published plate. The omission is significant. In fact, the drawing was sent to Lindley, who labelled the plant "*Catasetum naso*," but the detached female flower "*Monachanthus viridis*." Probably this circumstance explains Sir William Hooker's suspicion that it might be a sport of *Catasetum tridentatum*, for in those days only this vague term could be applied to the curious phenomena occasionally observed in the genus. *R. A. Rolfe*.

MORMODES ROLFEANA, L. Linden.

Sepals and petals light brown on a light green ground, and with darker green stripes. The face of the very fleshy rigid lip is brownish crimson, also the back of the column, the front of this organ and the back of the lip being greenish yellow. The species require the same treatment as the *Catasetums*. A sunny situation suits them best; nevertheless, they should be shaded when the sun is too hot. After flowering, all the species lose their leaves, when the amount of water given should be considerably reduced for a period of several weeks, while the plants are in a state of semi-repose. When the new growth appears, the amount of water should be gradually increased, in order to restore the plant to full activity. *Lindenia*, t. 289.

LILIA GRANDIS, VAR. TENEBROSA.

Sepals and petals, dull copper-coloured; lip, purple; disc, black-purple; edge, white. *Lindenia*, t. 290.

DENDROBIUM LEUCLOPHOTUM.

A north Queensland species, with elongated pseudo-bulbs; flowers, white, in many-flowered racemes; sepals, ligulate; petals, oblong acute; lip, trifid. *Lindenia*, t. 291.

CATLEYA BICOLOR.

An autumn-flowering species. Segments, clear brown; lip, amethyst-violet. *Lindenia*, t. 292.

LILIA FLAVA.

Flowers, yellow; segments, linear narrow; lip, convolute; anterior lobe, flat-fringed. *Orchidophile*, *Junc.*

CHISWICK NOTES.

THE representatives of the Ware and District Horticultural and Mutual Improvement Society visited the Chiswick gardens of the Royal Horticultural Society on Wednesday in last week, and derived much pleasure from the visit. The old garden was looking well, and this gardening contingent doubtless derived information as well as pleasure in their round of the garden, looking at the various trials, &c., that are now in operation, both in the vegetable and floral way.

In the former the Runner and Dwarf French Beans, Onions, Turnips, Tomatos, &c., furnished much interest. In the floral way, may specially be noted the masses of Carnations then in flower, Sweet Peas, Violas, and Pansies, showing the wealth of material at hand for the outdoor embellishment of our gardens. Perennial Asters and Sunflowers, whose nomenclature will probably cause burning questions to arise, deserve a passing note. The house of those useful decorative plants (Fuchsias) would be the

means of note-books being called into requisition, to jot down the names of the striking sorts; and to admirers of zonal Pelargoniums for house decoration, the claims of these plants would not be overlooked.

In the fruit department, attention was arrested (outdoors) by the crops of Apples, Pears, Plums, &c., which are fairly good; whilst indoors, the big conservatory promises a good supply of Grapes, as usual; and the long vinery looks well with its fine bunches of Gros Colmar, Alicante, &c., which will be seen to greater perfection as the season advances.

The fruit-evaporator in operation furnished an excellent item in the day's programme; the machine for paring Apples evoked interest. Altogether, associations of gardeners might do much worse than include Chiswick in the programme of their annual horticultural outings.

The serious storms have recently played some mischief with the Carnations, a few of the best of which may be noted amongst the following varieties:—In the whites, good, were Snowdrift, White Queen, Penelope, and Mrs. Frank Watts; Comtesse de Paris is a very free-blooming pale blush; Maggie Laurie is a beautiful delicate blush. Scarlets furnish bright and pleasing patches of colour, the more noteworthy sorts being Rowena, bright scarlet; Guiding Star, good strong habit of growth; The Moor, a fine dark crimson; Feuerball, deep scarlet; Dan Godfrey, scarlet flake; Albrecht Duesser, deep rose, crimson flake; Edith, pale pink, spotted scarlet. The now well-known Mrs. Reynolds Hole, terracotta, was seen in capital condition. Amongst the yellows—obviously a showy and useful class—may be mentioned Will Threlfall, bright yellow; Germania, the latter perhaps more suited to pot culture; Canary, pale yellow; Theodor claims attention on account of its peculiar colour, which may cause it to be valued by some, this being a dull slate. Noticeable amongst the Picotees were Redbraes, Romeo, Favourite, Mr. Rudd, and Mary.

Eckford's Sweet Peas form quite an attractive feature. Of fine quality are the following:—Captain of the Blues, the standards bright purple-blue, with pale blue wings—a very striking and fine variety; Queen of England, white, of large size and good substance; Mrs. Gladstone, delicate pink standards, the wings blush, edged with delicate pink—a singularly pretty and pleasing variety; Senator, a large bold flower, finely expanded, standards shaded and striped chocolate on creamy ground—a charming variety; Princess of Wales, a beautiful variety, shaded and striped mauve on a white ground; Isa Eckford, creamy-white suffused with rosy-pink.

A house of well-grown and flowered Fuchsias, before referred to, deserves a few additional notes. There is nothing startling in the way of novelties to record; we seem to have almost reached perfection in this particular flower. The old Rose of Castile is still a favourite flower, and is here well represented. First of the Day is a good single; Red Spitfire is a showy variety, having bright scarlet sepals, corolla well-formed, and of deep magenta; Phenomenal is a very fine double with scarlet tube and sepals, a dark purple and blue corolla. Another good double is Alophe Legour, sepals large and well reflexed, corolla violet rose.

Amongst the yellows may be mentioned Aurora superba, tube and sepals rich salmon, corolla large, spreading, orange scarlet suffused with yellow, fine free habit of growth, a distinct variety. Earl of Beaconsfield, one of the best for decorative purposes; the flowers are produced in large clusters, and constant bloomer. Mr. Randell, somewhat similar to the preceding, for general decorative purposes a capital variety. Winifred Glass has a blush tube and sepals, rich carmine corolla, shaded magenta; small, but very free. Flocon de Neige, white corolla, large, and well formed, sepals, clear carmine. Mrs. Mein, tube and sepals bright crimson scarlet; a well-reflexed flower, and of good shape.

In the Fancy section, worthy of note is Erecta var. Novelty, novel and distinct, tube and sepals stained white, sepals broad, corolla light pink, margin rose, free; a plant of strong habit, the flowers erect, and thrown well above the foliage.

EARLY FRUITS, &c.

The young trees are bearing fairly well this season. A small but excellent sort, of fine aromatic flavour, is Irish Peach (sometimes known as Early Crofton). Some of the pomological authorities recommend the tree to be lightly pruned, as it bears at the points of the shoots. A very handsome dessert Apple, but a somewhat "shy" bearer, may be noted in Red Astrachan; whilst "good cropper" must be applied to that excellent culinary sort, Lord Suffield.

A very small Pear, but useful on account of its being the earliest, is Doyenné d'Été, of refreshing flavour, and withal, of very pretty appearance.

Two decidedly good early Plums are the following:—River's Early Prolific, a valuable market sort. It is good for dessert, and also possesses the merit of being one of the best flavoured when cooked. St. Etienne, brought into notice by receiving Certificate honours at the meeting of the Fruit Committee on August 11, is an excellent cooking yellow variety of small size.

Among Tomatos Perfection is, of course, good; and Chemin, of recent introduction, may be noted as one of the best and distinct sorts, its fruits being large, smooth, red.

SALVIA PATENS.

A large bed of this is very conspicuous just now, being indeed a sheet of its very large intense blue flowers. A mass such as this has a striking effect in a border.

HELIANTHUS DORONICOIDES.

This is a good border species, a good-sized bed bere of its fine large yellow flowers presenting quite a glare of colour.

POLYGONUM SACHALINENSE.

This is a grand plant of immense size. A happy spot for it is on a moist herbaceous border, or fringing some water.

BACONIA CORDATA.

This is a bold and handsome hardy foliage plant, suitable for planting in the wild garden, or in isolated positions on the lawn, where its ornamental foliage is seen to advantage; it bears a spike of creamy-white flowers.

OLEARIA HAASTII.

A large bush of this good shrub has been very noticeable, crowded with a profusion of its sweetly-scented star-like flowers.

LYLES.

To lovers of these (and they are many), the interesting, and comprehensive collection at Chiswick will present many and various features of interest, as the various character of the plants develop some delightful bits of colour—green, gold, and silver.

Lastly it is satisfactory to find, that owing to the improved financial condition of the society, something is being done to reinstate the houses and frames which were allowed perforce to get into a sad state of dilapidation during the Kensington régime.

PLANTS IN FLOWER AT MESSRS. JAS. VEITCH AND SONS.

In addition to a good show of the ordinary Orchids which flower at this season, there are many very rare and beautiful species and varieties in bloom at the Royal Exotic Nurseries, Chelsea. Among them should be noted a plant of *Laelia Amesiana* (*L. crispata* × *Cattleya maxima*), and which even surpasses the favourite *Laelia xoniensis* in beauty. The plant in question is a noble one, with five leading growths and several flowers. The new *Laelio-Cattleya Proserpine* × (*L. Dayana* × *Cattleya velutina*) is in bloom, and proves to be a neat-growing plant and a profuse bloomer; the whole flower is of a delicate shade of lilac, closely veined all over with crimson in a manner not seen in any other Orchid. Among the *Cypripediums*, the new *C. macrochilum* × (*C. longifolium* seed-bearer × *C. Lindenii*) has a four-flowered scape of blooms, resembling in colour those of *C. caudatum* Wallisii, but with a curiously large and elongated pouch, which

is beautifully spotted inside. The rare *C. Aylingii* (*niveum* × *ciliolare*), too, is in bloom; also the handsome *C. Youngianum* ×, of which the variety raised by Messrs. Veitch is a specially fine one, rivalling in beauty the favourite *C. Morganæ* ×; *C. tonsum superbum* also exhibits its large and curious flowers; and *C. Canhamianum* ×, *C. orphanum* ×, *C. Tautzianum* ×, and other rare kinds, are in bloom.

Among other noteworthy plants here in flower are several examples of *Saccolabium Hendersonianum*, and specially good, *S. celeste*, *Renanthera matutina*, *Ceolozyne Cumingi*, *Dendrobium rhodostoma* ×, *Sobralia xantholeuca*, a large *Peristeria elata*, and *Laelia crispata*, with fifteen spikes, bearing together 105 flowers. There are, too, some excellent varieties of *Cattleya velutina*; and among the *C. gigas*, one approaching to *C. Hardyana*, and with a peculiarly pretty yellow marking at the sides of the labellum.

A noble bank of Lilies, chiefly made up of the newer forms of *Lilium auratum*, exhibits them at their best. The showiest are the specimens of *L. auratum rubro-vittatum*, with a broad crimson band down the middle of each petal. *L. a. virginale* is a very fine pure white. Two of the best in habit, and in size and form of their flowers, are *L. auratum macranthum*, a noble variety, with large pure white flowers with the middle of each petal rich yellow, but without chocolate spots; and *L. a. platyphyllum*, which resembles *L. a. macranthum*, but has reddish-brown spots along the middle of the segments.

EXPERIMENTS WITH ASPARAGUS.

In a recent *Bulletin* from the Ohio Agricultural Station, Professor W. J. Green reports an experiment on "Seed-bearing and Non-Seed-bearing Asparagus." The male and female flowers of the Asparagus are borne on separate plants; hence, as is well known, all the plants do not produce seeds.

Seed-bearing is an exhausting process, and, as might be supposed, those plants that yield seeds have less vigour than those that do not. In order to determine the difference in vigour between the seed-bearing and non-seed-bearing plants, fifty of each were staked off in a plantation of about half an acre. When the cuttings were made, the shoots taken from male and female plants were kept separate, and the weight of each recorded.

Observations upon the two kinds of plants were extended through the seasons of 1889 and 1890, and cuttings were made in the ordinary manner. The results are as follow:—

Asparagus, products from Male and Female Plants.

	From fifty male plants.	From fifty female plants.
	Ounces.	Ounces.
First period, ten days	37	21
Second period, ten days	101	68
Third period, ten days	255	164
Fourth period, ten days—	213	154
Total for the season	610	407

The total average gain of the male plants over the female was a little more than 33 per cent., while in the first period the gain was 43 per cent. The greatest difference between the two lots occurred during the first period, showing that male plants are earlier than the others. The shoots from the male plants were also larger than those from the female. Male plants can be secured by dividing old roots or by selecting such two-year old seedlings as do not bear seeds.

THE USE OF RUBBER BANDS IN BUNCHING ASPARAGUS.

India-rubber bands are found to be superior to string or netting, for bunching Asparagus, because they hold the stalks in place better, and they are also cheaper when the labour of putting them on is considered.

The method employed in bunching with rubber-bands is to slip a band over an ordinary tea-cup—one with straight sides and without a handle—fill the cup with Asparagus shoots, the heads downwards, then slip the band from the cup to the bunch. This makes a bunch of about the right size, and gives the upper end a nicely rounded appearance.

All that remains to be done is to slip on another band and to square the butts with a sharp knife. Possibly a metallic cup would answer better, being thinner, but a tea-cup is not objectionable in this particular. If smaller bunches are desired than the smallest cup that can be found, it is not necessary to fill the cup. Two thousand bands suitable for bunching will weigh about one pound. Two bands are used for a bunch. *J. J. Willis, Harpenden.*

FRUIT FARM NOTES.

Fruit farming and jam-making have been much advocated of late, but that the former is no new industry is evidenced by what is to be seen at Ramsey, near Harwich, on the eastern coast, where Mr. Ward has many acres of trees, most of which he planted over forty years ago; some of the Apples and Pears being of very large size, as they are not restricted, or subjected to much pruning. This will readily be understood when it is stated, that a single tree of the latter has, in a single season, yielded over a ton of fruit, the sort being Golden Knap (Drop), a Scotch variety; the Pears are small, and not of good quality, although they seem to sell in the market. Other kinds that are largely grown are Williams' Bon Chrétien, Conseiller de la Cour, and Madame Treyve. But strange to say, one of the greatest favourites, Louise Bonne, is hardly represented, as it is found to cauter so badly, that it is almost given up as a failure.

Of Apples, Mr. Ward has upwards of one hundred kinds, but he says that twenty would be better; those he thinks most highly of are Keswick Codlin, Lord Suffield, Duchess of Oldenburgh, Warner's King, Tower of Glamis, Cox's Orange Pippin, Blenheim, Alfriston, and Mère de Ménage.

Plums are grown in immense numbers, there being acres of them, in thickly planted rows, and all literally laden with fruit, some so much so as to have the branches quite borne down by their weight. It is plain, therefore, that the frost, so fatal in many parts, did not reach Ramsey; but then the land lies near the sea, directly between two tidal rivers, the Handford water and the Stour, the elevation being about 50 feet, but quite open and somewhat wind-swept, as there is little shelter near. The Plums most in favour are the following:—Early Orleans and Early Rivers, the first-mentioned being larger and a little earlier in ripening, therefore a very desirable kind; Victoria was, of course to be seen in quantity, as well as Prince of Wales and Jefferson. Mr. Ward thinks very highly of Autumn Compôte, and a sort the writer of this is unacquainted with, the fruit being large, oval, bright red, and hanging thickly on the trees.

Damsons, from some cause or other, have been neglected at Ramsey, as only a few old trees were to be seen; but two years ago Mr. Ward had 200 planted, the sort being the Farleigh, and they now are crowded with fruit, and look the picture of health. The ground under the trees is all occupied with Gooseberries, Currants, and Raspberries, the chief kinds among the first-mentioned being Golden Drop, Crown Bob, and Warrington.

Strawberries are all in the open, exposed to sun and air, the rows being about 2 feet 6 inches apart, and the plants in the lines half that distance, and strong and well they look, with finely-developed crowns, as they ought to have, from the treatment they receive, there being no denudation of foliage beyond that just outside the plants when the runners are cut away and removed, and the land cleared after the fruit is all gathered. When fresh plantations are made, the practice with Mr. Ward is to crop between the rows with Onions or Lettuce the first year. Sir Joseph Paxton and British Queen are the chief sorts

Mr. Ward cultivates, and both seem quite at home on the land.

Being so far away from any great city, I was curious to know where all the fruit on the place went to or could be disposed of, and in reply to the query, Mr. Ward said, "I hardly know, but it all goes—some to London, Tiptree, Walton, Dovercourt, Harwich, and other parts;" and he seemed to have no fear of foreign competition, for, said he, when I mentioned the subject, "where should we be without the foreigner, as up till now we have had nothing but soft fruit in the market?" A good deal of continental produce is landed at Parkstone close by.

Besides being a fruit cultivator, Mr. Ward is also a farmer and a market gardener in a large way, and has great breadths of Potatoes that look remarkably well, and at the time of my visit (August 14) there was not a diseased leaf to be seen. Ashleaf is the kind grown for early work, followed by Satisfaction and Magnum Bonum, the last-mentioned forming the bulk. The tubers lifted for me to see were remarkably clear and fine, and the crop heavy and good.

The Celery at Ramsey is grown in trenches, and three rows of Paris Cos Lettuces along the ridges between, thus turning all the land to account. Cucumbers are sown in the open ground, and were just coming into bearing, the bulk of produce being sent away in barrels to market. That Ramsey must be a favoured spot as regards climate is shown by the Broccoli standing last winter as well as other green-stuff, which was killed elsewhere, or so cut as not to be of much use. The soil is a good greasy loam, resting on the London clay, and therefore well adapted for the purpose to which it is put. *J. S.*

BOTTLING OF FRUITS.

Fruit can be had all the year round nearly equal to fresh-picked fruits. Those who possess a small garden, often waste small perishable fruits, of a tender nature, especially where the market towns are some considerable distance away, the prices sometimes very low, and the market glutted. To prevent this loss, bottling of small fruits will be of great advantage to the grower, as bottled fruits meet with great demand, in fact, they are much preferred to jams, possessing more the natural flavour of the fruit. To have fruit either for bottling or preserving, it must be manufactured on the ground. Bring the factory to the fruit—it saves carriage, and unnecessary packing and handling. Pick your fruits, such as Currants, Gooseberries, Plums, Apricots, Cherries, and all kinds of small fruits, straight into the bottles from the trees. The fruit should not be dead-ripe, but rather under ripe, as it keeps whole, and adds much to the appearance after cooking. Put as much fruit into bottles as possible, giving them a shake occasionally, so as to get them packed firmly together, taking care not to have them broken. After the bottles are well-filled with fruits, pour clean water into them until it runs over the rim; see particularly to this, as nothing looks worse than a bottle not being full. The corks should be of the best quality, free from holes; and fitting tightly. They will require some force to drive them down; place small pieces of tin on the top of the corks, about the size of a shilling, to keep the wire from cutting them. As a certain amount of expansion takes place in the cooking, and is apt to raise the cork, if not tightly secured, wire as you would an ordinary soda-water bottle.

Place the bottles in cold water into an ordinary fish-kettle or pan, upon the bottom of which a cloth has been placed to keep the bottles from touching the pan. The water must be poured in within 1 inch or so of the top of the bottles. The process must be slow at first with the fire, otherwise the bottles are apt to crack. Have your thermometer in the pan so as to be able to watch the rising of the temperature. Let it rise gently until 165° is attained, which must take one hour—thus the process is very slow. Let them cool gradually. Take a mixture of resin and a small quantity of oil boiled together, then dip the end of cork into the mixture while hot, which seals over any minute holes, making the bottle quite

air-tight, otherwise fungus spores will enter and develop. Place the bottles on their sides in any cool place. For home consumption the flavour is much better when no water is added; for trade purposes, adding water to them gives the bottles a better appearance. When no water is added the fruit shrinks, and consequently the bottle is not full. Their flavour, when prepared in this way, is equal to fresh-gathered fruit. When cooking for use never add sugar to them until served up, as sugar toughens the skins, especially of Plums and Cherries. *J. T.*

VEGETABLES.

SPINACH.

LAST winter again gave convincing proof of what a valuable vegetable this is, for when almost everything else in the kitchen garden was killed, Spinach seemed to bid defiance to the weather, and passed safely through. This immuoy from injury, no doubt, arose in some measure from its lowness of growth, and the friendly covering of snow that laid over it so long, thus protecting it from the hard frost, to which other vegetables were more exposed, and from the effects of which most of them perished, as we had no wind all through the season. To make sure of having a good supply through winter and spring, it is necessary to sow twice, as sometimes, if the autumn is warm and open, the first sowing runs or becomes too forward for the leaves to be of much use for picking. For spring use, the best situation for Spinach is a sheltered border facing south, although for first gatherings beds or rows on the open quarters do very well. Wind is often more fatal than frost, and on a warm sunny border Spinach grows away freely as soon as the days begin to lengthen, and affords many gatherings before much can be had from that in the open. For the first supply to pick during late autumn, the third week in August is the time to sow, while that for spring should be got in towards the end of September. In many gardens it is a very difficult matter to grow good Spinach, on account of wireworm in the land, and I used to experience much trouble from these, till I applied soot, which I can most strongly recommend; the way to use it is to sow just enough over the ground to blacken it, and then dig it in. If the land is poor, rotted manure should be used; for to get fine leaves, Spinach must be well fed, and then it is succulent and tender. The old prickly-seeded is far surpassed now by the Victoria, which produces larger leaves and of a much more fleshy substance, and should therefore be grown instead of the other, as besides the superior qualities it is quite as hardy and not so apt to run as the prickly. The Victoria is a stronger grower, and needs more room; the rows should be at least 18 inches apart, and the plants not nearer than half that distance, as then they will have space to develop. In preparing for sowing, it is important to have the land firm and the surface raked fine, and when brought to that condition the drills should be drawn, making them about 1½ inch deep, and sowing the seed very thin, which will save labour and time in pulling up plants. Not only is soot good for digging into the land, but it is also first-rate as an early spring dressing to scatter between the rows and hoe in before the Spinach has made much growth, and if that is done its beneficial effects will soon be apparent in the improved colour and the greater crop of fine leaves. *J. Sheppard.*

THE DELL, EGHAM.

THE beauties of Baron Schroder's gardens are well known to most gardeners and garden-lovers in Europe, and many in America doubtless call to mind with pleasure the sights they have seen there when visiting England. Year by year the liberality of the Baron, and the care and thoughtfulness of his gardener, Mr. H. Ballantine, add new beauties to

it, the last, the extensive rockeries, being one of the most attractive. In these a defective spot has been beautified, and in their construction Pulham has done his work well, artistically winding and sinking or raising the rockery as the situation required, and introducing pieces of water in several places with considerable effect. Beyond these circumstances, the rockery has been fortunate in being skilfully planted; the capping of these massive rocks, which cannot be carried up beyond a certain height, being especially well done.

It is needless to enumerate the beautiful alpinæ and herbaceous perennials in flower, suffice it to mention a few. In one of the pieces of water is a charming view, in which the flower is given by a huge mass of white *Iris Kämpferii*, another of *Menyanthes trifoliata*, the surface of the water being studded with the fine leaves and flowers of the Water Lilies, and in the foreground a large mass of *Sarracenia purpurea*. Beyond are large patches of the

THE ORCHIDS.

Turn we, then, to the Orchids in the extensive blocks of houses devoted to them, after the manner of visitors to The Dell generally. In them we find several important changes, evidently for the better, have taken place. For some subjects new houses have been erected, and for others a change of quarters has been given, which, in most cases, has had a salutary effect. The fine collection of specimen *Cattleyas* still inhabits the large structure built for them, and in which there are some fine blooms on the different forms of *C. gigas*, *C. Gaskelliana*, and *C. Mendeli*. Here, too, is a large specimen of *Sobralia Warscewiczii* in flower, also the handsome *Lælia callistoglossa*, the pretty *Dendrobium lineale*, and the fine crimson *Broughtonia sanguinea*, which is said to bloom from early spring onward.

In the Fernery, with its stately Tree Ferns, we find the specimen of *Sobralia xantholeuca*, so often noted, in flower; it is now some 8 feet across, and

we find a good show on specimens of *Anguloa Ruckeri*, *Zygopetalum Gautierii*, *Odontoglossum bictonense album*, *Oncidium panchrysum*, *O. hæmatochilum*, *Mormodes luxatum eburneum*, and some charming specimens of the lovely orange-scarlet *Lælia monophylla*, one of them with twelve flowers. This gem of an Orchid puzzled every one to grow until cool treatment was tried with it, and then it was found to be a very free plant and wonderfully floriferous.

In the East India House, which has the collection of *Phalaenopsis* on one side and growing *Dendrobæ* on the other, the noble *Aerides Sanderianum*, *A. nobile*, *A. affine*, *Vanda Roxburghii*, *Catasetum Bungeothii*, *Platyclinis filiformis*, with fifty spikes; the perennial flowering *Dendrobium rhodostoma* ×, with fourteen spikes; *D. crystallinum album*, *Celoglyne Massangeana*, some *Phalaenopsis*, and some grand specimens of *Utricularia montana* and *U. Endresii* are in flower, the last named literally

FIG. 32.—FOOLHITS: SIR HENRY DOULTON'S SEAT IN SURREY. (SEE P. 241.)

different Heaths, *Campanulas*, *Epimeliums*, and other dwarf plants, and among them the elegant spikes of Foxglove, the scarlet *Kniphofia*, *Mecynopsis Wallichii*, with 5 feet spikes of large pale blue flowers; large clumps of Ferns—the *Adiantum pedatum* being especially fine—and other things in beauty and size beyond what is generally met with. Here, too, are planted all the compact-growing *Coniferae*, such as Golden Yews, *Retinosporas*, *Thujas*, &c., and which it is intended to keep to the form required by the use of the knife after the manner carried out at the entrance-gate, and about the gardens generally, with so much success.

The magnificent *Araucarias*, *Sequoias*, Cedars, *Abies*, and other *Conifers* and shrubs with which these gardens are beautified, seem not to have suffered by the late severe winter, and the clumps of flowering perennials in various parts of the garden seem more than usually bright, their show being considerably enhanced by the brilliant display of summer flowers bedded out near the mansion, and in which the several beds of tuberous *Begonias* play an important part.

bears a profusion of its large pale yellow blooms. It commenced to flower in May, and it will be a fine sight for some time to come yet. In the first division of the next range of lean-to houses, the forms of *Masdevallia chimæra* are good. In the second, among well-grown *Odontoglossums*, in flower, were a fine tuft of *Promenæa xanthina*, a superb and large form of *Odontoglossum Wallisii*, and some fine forms of *Odontoglossum Harryaoum*. In the third division the most prominent objects are a specimen of *Maxillaria venusta*, with over fifty flowers; *Nanodes Medusa*, *Masdevallia Gaireana* ×, *M. racemosa*, *Epidendrum vitellinum*, *Cochlioda vulcanica*, sending up over thirty spikes, &c., and in this cool house the Filmy Ferns seem to thrive well.

In the next range the rare *Cypripedium Fairrieanum* and its hybrids are doing well, and some large masses of *Dendrobium longicornu* are in flower. Here the collection of *Vanda tricolor* varieties are in grand health, with some of them in bloom, as well as fine specimens of the elegant *Ionopsis utricularioides*, *Miltonia Schroderiana*, and *Zygo-colax leopardina* ×; and continuing along the range,

sending out a shower of pretty sky-blue flowers, all around the baskets in which they are growing. The large collection of *Cypripediums* in bloom have some fine forms of *C. Harrisianum* ×, *C. Curtisii*, *C. superbiens*, *C. chloroneurum* ×, *C. numa* ×, *C. Volonteanum*, *C. Dominianum*, *C. orphanum* ×, *C. ænanthum* ×, *C. Euryandrum* ×, &c.; and in the *Nepenthes* house are some well-bloomed *Galeandra Baueriana*. The *Odontoglossum*-house, which contains, without doubt, the handsomest and most valuable specimens in the world, although not at its showy season, is far from bare of flower.

In the large stove, among the handsome scarlet *Anthuriums*, &c., are the *Dendrobiums* of the *D. densilorum* section, and among those in bloom a fine specimen of *D. Guibertianum* with three spikes. In the other plant-houses the *Achimenes* are good. *Begonias* very showy, *Carnations* well bloomed, and all the other things in the usual condition expected at The Dell; whilst the vineries and other fruit-houses, which equal in extent the Orchid part of the establishment, and are as neatly kept, are in crop and condition all that could be desired.

FLORISTS' FLOWERS.

THE AURICULA.

GROWERS are always anxious to compare notes with each other, even if it has to be done by letter; and, so far as I can gather, this year the growth and appearance of the plants are better than usual. Mr. Horner, writing this week from Lowfields, Kirkby Lonsdale, says the growth is very vigorous; he uses the word "proud." Our own plants are also vigorous, and a large number of them have produced, and are producing, autumn trusses. With us this free-blooming character generally follows a good autumn growth, but the plants have time to form a new heart again before the winter; when they flower later, the chances of a good spring truss is more remote. In the north, the growers have not much trouble with autumn blooms. Mr. Horner rarely has more than five per cent. which throw up trusses; whereas in our own collection, and also in that of Mr. Henwood, at least fifty per cent. of the full-sized plants will flower. Neither of us try any special system of culture to prevent it, for whether the plants are kept moist or dry at the roots, the results are the same. We have finished repotting the whole of the full-grown plants. The alpiners came last; generally they are not repotted until September, but I thought it better to see to them at the earliest possible opportunity, which for us this year was the last week in July. We finished the show varieties early in the same month.

The repotting of the plants affords an opportunity to remove any offsets that are ready. These are planted at once in thumb pots, which are filled about two-thirds with the ordinary potting soil, the top portion being made up of quite sandy loam and leaf-mould. In this the offsets rapidly establish themselves, and I find these small thumb pots are much better for the purpose than the larger small 60's are. The best position for them is in handlights on the north side of a wall.

Seedlings to flower next year should be potted on as the plants increase in size. They make the most growth in August, September, and part of October. We have sown the seeds saved this year both from the show varieties and the alpiners. We expect a few plants to appear between the time of sowing and the last days in October. A larger number vegetate in February. I have often urged the raising of seedlings, as affording an inexhaustible fund of instruction and amusement to amateurs, and I find that the advice has in numerous instances been followed. This is not the time to describe the system of crossing, which will be alluded to in its season, but advantage should be taken to obtain the very best varieties in the various classes.

There are four classes of show Auriculas, and the best three in each would give the twelve best Auriculas. The following are the best, as recorded by the vote of the leading growers in the spring of the present year: Green edged, Rev. F. D. Horner, Simonite; Colonel Taylor Leigh; Prince of Greens, Trail. Grey-edged: George Lightbody, Headley; Lancashire Hero, Lancashire; Mabel, Douglas. White-edged: Conservative, Douglas; Acme, Rad; Smiling Beauty, Heap, Selts; Heroine, Horner; Mrs. Potts, Barlow; Black Bass, Woodhead. The twelve best alpiners are Edith, Turner; Sunrise, Unique, Mrs. Ball, Pallas, King of the Belgians, Mungo McGeorge, Diadem, Gorton; Love-Bird, Douglas; Philip Frost; Mrs. Meiklejohn, Meiklejohn; and Macida. Most of the above were raised by Mr. Turner, of Slough.

THE CARNATION AND PICOTEE.

This has been a very late season. Our own flowers were not of a high order of merit this year, the flowers small, and the petals thin. The plants themselves did not suffer, and layering was completed by Aug. 11, so that we will hope to have a good lot of plants for next season. I find it is rather difficult to save seeds of the best double varieties, the petals are too much

crowded together, and pollen is not easily found. Such varieties have also a tendency to burst the calyx, and it is a question whether seedlings should be raised from them, even if it were easy to do so. The demand in these days is for varieties with broad, well-formed, shell-like petals, which are regularly arranged in the calyx. Such varieties should be selected as seed and pollen-bearers, if the flowers are well-marked with flakes and bizarres of rich purple-rose and scarlet, or if they are self of bright and decided colours. The pollen-bearing flowers should be of good form, as well as of the most desirable colours and markings. The seed-bearer should be of vigorous habit; this is of the greatest importance, as the Carnation and Picotee are required to winter out-of-doors, and to bloom in the flower garden. Amateurs are anxious to obtain varieties of yellow-ground Carnations and Picotees, as well as good self-coloured yellow varieties, that will succeed out-of-doors. The best yellow self for the open border, is Pride of Peshurst.

There are numerous new varieties still untried. [Germania seems to be a good hardy yellow self. Ed.] The seed-pods now forming on the plants must be protected from wet by a glass shade, as the pods, unless protected, are likely to rot. All the seeds I have saved have been from plants grown in an airy glass-house. Encourage the growth of seedlings by keeping the ground clean between the rows with the Dutch hoe. Seedlings a year older should be marked and layered as the flowers develop. *J. Douglas.*

ROSES.

Pot-grown Roses.—The full beauty of the Rose is best appreciated in the open garden, where they are planted in groups and well cultivated by rich feeding and deep working of the ground, so that during the summer months pot Roses are not needed; this is quite true, as most cultivators and admirers of the Rose will admit. Although the plants are not wanted for flowering at present, this is no reason why they should not be carefully looked after, in order that they may be well prepared for flowering when the time comes. I wrote about the spring treatment of pot Roses in the *Gardeners' Chronicle*, April 11, 1891, p. 471. Our own plants produced many very fine flowers under the treatment there recorded, but the flowers passed away in April and May, and the Rose bushes are now in an open position out-of-doors. They usually retain their healthy appearance out-of-doors without much trouble if the leaves can be daily syringed, and the roots are supplied with water as often as they need it. We have no accommodation for very large specimens, and the moderate-sized examples seem to succeed best with annual re-potting; and as the future success of the plants depend upon the constituents of the material and the quality of the work, the utmost care is necessary.

The more vigorous growing hybrid Perpetual Roses and hybrid Bourbons delight in fibrous turf from an upland pasture with a clayey loam underneath; this should be enriched with a fourth part of decayed stable manure, and as much leaf-mould, with a little coarse white sand to keep the whole porous; some bone-dust may be added to the extent of an eight-inch potful to each barrow-load of the compound. Any of the Rose plants that have well filled the pots in which they are growing with roots, may have a good shift, using clean flower-pots between 2 and 3 inches wider than those in which the plants were growing in previously. Some varieties, owing to their less vigorous habit, or some constitutional derangement, do not make many roots, and when the time for repotting comes round, we may find the soil rather sour owing to the roots not running freely through it; these require rather different treatment. The poor soil may be removed, and the plants may be returned into the same-sized flower-pot as that from which they have been removed. In all cases perfect drainage is necessary, clean crocks should be used, and over them a thin layer of the fibrous part of the turf loam from which the clay particles have been well shaken out. The difference between careless potting and a careful attention to even the smallest details of the work, is not much as regards labour, but it is a great deal

when we come to count the advantages to the plants. The one may mean the drainage choked up a month or so after re-potting, and the other a clear outflow for the superfluous waters until the end of the season; in the one case unhealthy growth, and in the other a vigorous healthy development with the production of well-formed handsome flowers. The plants in our garden have a good position out-of-doors, and both the hybrid perpetual and the Tea Roses produce some nice flowers in the autumn; but as the cold damp nights set in the flowers do not open well, unless the plants are placed under glass. They do not need an artificially-heated atmosphere, as the dry airy greenhouse protects the flowers from damp, causing them to open beautifully. I need not say that all insect pests and parasites must be kept from the leaves. They are so liable to be attacked by mildew, that, probably, no collection of Roses is ever free from it. If the Rose bushes are not large, dipping them in a tobacco liquor and sulphur mixture, destroys red-spider, thrips, greenfly, and mildew at once. Once only were the leaves attacked by the Orange-fungus, which came to us with some pot Roses that had been purchased; it was detected on its first appearance, and all the portions of leaves attacked were cut off and burned. The Roses were dipped in the mixture indicated above, and this was the first and last of the Orange-fungus in our garden, either from pot Roses, or Roses in the open garden. The hybrid perpetual Roses do not suffer much as regards the health of the plants by being left out late in the autumn. If continuous rains set in, which are likely to drench the roots too much, we lay the pots on their sides. The Tea-scented Roses are more tender in respect both of the plants and the flowers, and if left out late, the leaves sometimes drop off, and at other times they become plentifully besprinkled with black fungus spots. I ought also to add, that the Tea Roses succeed better with a more open compost, and if some brown fibrous peat can be obtained to add to the potting soil, the Rose will be the better for it. When well grown in the summer and autumn, they flower well later, and more profusely, than most of the hybrid perpetuals. We have had beautiful blooms and buds with the Chrysanthemums. The autumn flowering does not militate at all against their flowering well in the spring and early summer the following season. Some varieties of Roses are much better adapted for pot culture than others; indeed, some are not adapted to it at all, and those who are desirous of cultivating Roses in pots, and have but little knowledge of the subject, would do well to entrust their order to a dealer who thoroughly understands them. The Tea-scented Roses are the most esteemed for the purpose, and a few of the best are Alba rosea, Amazone, Anna Ollivier, Belle Lyonnaise, Catherine Mermet, Comtesse de Nadaillac, Devoniensis, Etoile de Lyon, Gloire de Dijon, climbing; Hon. Edith Gifford, Madame Berard, climbing; Madame Falcot, beautiful in bud; Niphotos, Souvenir d'Elise Vardon, Souvenir de S. A. Prince, Sunset, and The Bride. Hybrid perpetuals are harder Roses, and more easily managed by the inexperienced cultivator. The better varieties for pot culture in this section are:—Alfred Colomb, Alphonse Souper, Boule de Neige, Captain Christy, Charles Lefebvre, Dr. Andry, Duke of Edinburgh, Eugène Levet, François Michelin, Heinrich Schultzeis, Jules Margottin, La France, Madame Gabriel Luizet, Madame Victor Verdier, Marie Baumann, Mrs. John Laing, Senateur Vaisse, Victor Verdier, and Violette Bouyer. *J. Douglas.*

DEVONSHIRE FERNS.

It is but natural that the county of Devon with its luxuriant Ferns, and possessing a surface territory of, at least, 2500 square miles, comprising a great number of fertile valleys and sheltered combs, and an extensive coast line—should be unusually rich in flowering and flowerless plants. These number many hundreds of species; in fact, it has been said that quite two-thirds of the kinds known as being indigenous to Britain, are to be found there; moreover, there is no spot in the land where the birds sing so sweetly. I was, however, not prepared to receive the information given in the notes contributed by "The Strolling Devonian" in the county-chat column of the *Devon Weekly Times* recently, that the kinds of Devonshire Ferns were so numerous that the admirers of those interesting plants were in

sad trouble and perplexity as to their identification, and that there was no Fern book in existence which gave plain English descriptions and illustrations.

Things must have strangely altered since I left Alphington, unless the "Strolling Devonian" has erred. There was a time in past years when I found delight in the study of the Ferns of my native county, and made a hobby of it, searching out their haunts in every district, and so far as I am aware, there were only about a score of species, including some extremely rare ones, which ere now I fear have been annihilated, for, of late years, the advertisements of the Fern stubbers have been continuous, and every issue, of one newspaper in particular, reveals tempting offers from persons — especially females — who practise this work of destruction and vandalism. I, for one, do not see much harm in the removal of a few of our native Ferns by the amateur or student; and, with a view of helping the "Strolling Devonian" and his puzzled friends, I may say that cheap, trustworthy, illustrated books on Ferns are easily obtainable, remembering that many species are known by different generic names, which, I suspect, has contributed to the confusion he speaks of, because some authors adopt one and some another. For example, the common Male Fern according to a recent publication is named *Nephrodium Filix-mas*, and by another authority *Aspidium Filix-mas*, whereas most people know it as *Lastrea Filix-mas*. The Lady Fern was known as *Athyrium Filix-femina*, but this has been altered to *Asplenium Filix-femina*, and the hard Shield Fern has long enjoyed the title of *Polystichum aculeatum*, but now is styled *Aspidium aculeatum*. Moreover, the old scaly Fern known everywhere as *Ceterach officinarum* is catalogued as *Asplenium Ceterach*. These are but a few of the changes, and so the world goes rolling on, which goes to prove that in Fern lore, at any rate, it is necessary to keep in close touch with "to-day," for it seems the lesson gained yesterday stands in danger of being reckoned a farce and a delusion.

The Ferns most frequently found growing wild in Devonshire are:—the Brake Fern (*Pteris aquilina*); the Male Fern (*Nephrodium Filix-mas*), the Lady Fern (*Asplenium Filix-femina*), the Hart's-tongue (*Scolopendrium vulgare*), the common Polypody (*Polypodium vulgare*), the rough Spleenwort (*Lomatium spicatum*), the Maidenhair-Spleenwort (*Asplenium Trichomanes*), the black Spleenwort, known in Covent Garden as the French Fern (*Asplenium Adiantum nigrum*), the Scale Fern (*Asplenium Ceterach*), the hard Shield Fern (*Aspidium aculeatum*), the Royal or Flower Fern (*Osmunda regalis*), the wall-rue Spleenwort (*Asplenium Ruta-muraria*), the crested Shield Fern (*Nephrodium spinulosum*), the great crested Shield Fern (*Nephrodium spinulosum dilatatum*), the soft Shield Fern (*Aspidium angulare*), the sea Spleenwort (*Asplenium maritimum*), the Beech or Mountain Polypody (*Polypodium Phegopteris*), the common Mooswort (*Botrychium lunaria*), the Adder's Tongue (*Ophioglossum vulgatum*), and the Filmy Fern (*Hymenophyllum tunbridgense*), &c.; but some of the last-named were very scarce years ago, and can now, I expect, be only found in private gardens, where, latterly, the various forms of British and exotic hardy Ferns have been manipulated and many seedlings raised, so that now we have in cultivation hundreds of garden varieties, many being extremely novel and beautiful. *W. Napper, Chelsea.*

FORESTRY.

SEASONABLE WORK—AUGUST.

NOTWITHSTANDING the cold backward weather which we experienced in many parts of the country during the spring and early summer, yet on the whole vegetation and trees have made satisfactory progress, and in Ireland I think I never saw things looking better—many of the trees, both forest and ornamental, are actually loaded with fruit and fine

healthy-looking foliage. There appears to be a fine crop of haws, hips, and wild fruit generally, which will prove useful and valuable in due course. Haws gathered and sown at once at this season of the year generally vegetate next summer, by which means a great deal of trouble, expense, and time are saved. Sow the haws broadcast upon well-worked ground in good condition, such as has carried a crop of early Potatoes, and formed into beds about 4 feet wide. A bushel of fresh collected haws should be allowed for about 20 lineal yards of a bed the size specified. The haws should be sown in a regular and uniform manner on the surface, pressed down with the back of a spade or roller, and covered with about half an inch of fine soil. In cases where the haws are sown in autumn, the covering should be rather deeper than the former, but as these do not vegetate the first summer, a crop of surface-rooting plants may be raised on the same ground without interfering with the haws below.

This is a very proper time of the year for pruning forest and ornamental trees where requisite. What I mean by pruning is, the removal of double leaders at the top, cutting back strong unwieldy side branches in order to lessen the risk of fracture by wind, and promote the formation of a uniform well-balanced top. Trees that are apt to bleed at the wounds where branches have been cut off, such as the Sycamore, Birch, &c., may be pruned at this season with impunity, as the wounds made at present soon heal up without any injurious effect. It is a mistake to neglect the pruning of young trees until such time as the branches or leaders to be removed have acquired a large size. Pruning should always be executed when the branch or leader to be removed can be cut off with a sharp pruning-knife; but in cases where the work has been neglected, and where the pruning-saw has to be used, the lips of the wound had better be pared and made smooth with a sharp knife, to prevent the lodgment of water, and in some cases it will be an advantage to dress the surface with a coat of thick paint, the same colour as the bark of the tree. The pruning chisel, fixed to the end of a strong pole is a very efficient implement for cutting off rival leaders at the top, as it not only saves the trouble of climbing, but likewise leaves a smooth sloping surface to the wound, which soon heals up, without any injurious effect whatever.

When trees are well managed in this way in early life, they seldom require much pruning in after years, and in order to promote the formation of clean timber, free of knots in the trunk, this should be brought about, as far as possible, in the course of thinning. Trees should always be allowed space for their full and healthy development, at the same time they should be thinned in such a way that the side branches gradually lose their vitality and fall to the ground of their own accord, by which means by the time they attain maturity the stems present fine clean shafts almost of a cylindrical shape, and free of knots or stumps for a distance of about two-thirds of the length of the stem. Isolated trees, however, and such as are growing around the margins of plantations, should have their dead branches cut off, otherwise they will become carbonised and as hard as horn, and thus lay the foundation for a loose knot in the timber. Pruning should always be conducted in such a way as to direct the whole energies of the tree to the formation of wood in the trunk, and thus prevent them from wasting their substance in the support of several stems and large unwieldy side-branches. Bush trees are very ornamental as specimens on the lawn or elsewhere, but as timber trees for utility they cannot be compared with such as has been pruned in early life and kept to one stem. Early and judicious pruning leaves no mark or blemish of any kind upon the tree; but when large branches or limbs are cut off the case is quite different, as large wounds often lay the foundation for rot and decay, and thus reduces the value of the timber to a large extent, and in many cases brings about the premature death of the tree. This system, however, of removing large limbs and branches from trees cannot be called pruning—mutilation is the

proper term, and in order to prevent confusion these terms should be always kept in view and well defined, the former is beneficial, and the latter destructive.

Young plantations should be examined frequently, and superfluous growths of whatever kind should be cut back or removed altogether according to circumstances. In my early days, Oak was often pruned in such a way as to promote the formation of crooks and bends for ship-building, but as iron is now being largely used for that purpose the training of Oak seems to command less attention, although at the same time knees and bends for boat-building generally meet a ready sale and good prices. From this it is to be gathered that large Oak trees with massive limbs are often very valuable for that purpose, and in training trees to one stem the Oak in a great measure may be exempt, and allowed more latitude to form bulky heads. Trees of this kind require considerable space to ramify, and should be grown along the margins of plantations and similar situations, where they have plenty of field to extend their limbs without crushing their neighbours. *J. B. Webster.*

BELGIUM.

GHEENT.

At the August horticultural meeting at Ghent, the plants shown were not very numerous, but were all noteworthy. Certificates were awarded for—1, *Asparagus trichophyllus*, from M. L. Desmet-Duvivier, an excellent variety; 2, A species of *Cattleya*, a natural hybrid, to MM. Edm. Vervaeet et Cie.; 3, *Adiantum palmatum*, from MM. Desbois et Cie., very rare and elegant; 4, *Cypripedium concolor* var. *Gardenianum*, from the same exhibitors, a hybrid of *Godefroyae* and *C. concolor*, with a flower like the latter, but of a paler shade; 5, *Lilium aratum cruentum*, from M. Bl. Pyaert Van Geert, with splendid flowers, which were much admired; 6, *Dracæna argentea striata*, from the same exhibitor. The following Certificates of Merit for good cultivation and blooming were awarded:—1, To *Pteris serrulata densa*, from M. L. Desmet-Duvivier, a charming specimen, exceedingly well cultivated; 2, to *Cattleya gigas atropurpurea* (unanimously awarded), from MM. Vervaeet et Cie., with fifteen superb flowers; 3, to *Clianthus Dampieri*, from MM. Desbois et Cie., grafted on *C. punicicus*, and of dwarf habit; 4, to *Impatiens Sultani*, with variegated foliage, from the same exhibitors, a very pretty specimen.

ANTWERP INTERNATIONAL EXHIBITION.

The gardens of the Royal Athenæum, where this Exhibition is located, are transformed into a magnificent garden, which has been lavishly stocked with representatives of the different floras of the globe. The large and fine *Chamaerops excelsa* of MM. Ang. Van Geert and G. Vincke-Dujardin, *Chamaerops humilis*, a fine plant of *Phormium tenax*, and a splendid *Dracæna lineata*, from the last-named exhibitor; *Elaeagnus Fortunei foliis marginatis*, *Testudinaria elephantipes*, an immense *Euonymus japonicus argenteo variegatus*, from M. Louis Desmet; *Chamaerops excelsa*, and a specimen *Clethra arborea*, from Madame Osterrieth; *Cassia floribunda* and *Hebe grandiflora*, from Madame G. Grisar; *Acer polymorphum palmatifidum*, and a splendid *Doryanthes Palmeri*, from MM. Desbois & Cie.; *Phœnix canariensis* and *Phormium tenax*, from M. D'Haene; and some pretty *Bouvardias*, bloomed by M. Vermeulen, are all remarkable for sturdy growth and excellent cultivation.

I would commend to the notice of amateurs the pretty Japanese plants from MM. Desbois, those from China and Japan from M. Ch. Van Geert, and his fine group of *Yuccas* and *Agaves*; *Arucaria excelsa* from M. G. Vincke Dujardin, and especially the splendid collection of Japanese and Californian Conifers; very pretty also are the plants of *Acacia paradoxa*, sent by M. Jules De Cock.

M. Pauwels shows some fine specimens of

Orchids; especially noteworthy is an *Oncidium divaricatum*, with an enormous cluster of flowers. The fine collection of Mexican Cacti from M. Vermeulen, the Japanese Lilies from MM. De Herot and Strecker, and the cut Gladioli from Madame Osterrieth, are all interesting.

CULTURAL NOTES.

BLANCHING.

This means the whitening of the leaf or leaf-stalk of the plants. Blanching is effected in plants by growing them in darkness for a period ranging from ten days to a fortnight, according to circumstances. Celery is blanched out-of-doors by drawing the leaf-stalks together at the top and covering them with a few inches thick of soil on both sides up to the heart of the individual plants, repeating the operation two or three times during the progress of growth. Cardoons may be blanched in a similar manner as Celery. Lettuce plants are blanched by tying the leaves together near the top with bands of matting when nearly full grown. Home varieties of the Cos Lettuce, owing to the infolding habit of the leaves, blanch naturally. Endive is frequently blanched by covering the plants where they are growing with Fern, pieces of slate, and boards; but in the event of wet weather setting in, a large number of the plants become a prey to damp. Endive and Lettuce plants are also blanched by lifting them from frames and transplanting in shallow boxes, pots, &c., putting them in Mushroom-houses, cellars, and such-like places, from which daylight can be shut out, putting fresh plants in at short intervals—say, every fortnight or three weeks, to keep up the succession. Chicory and Seakale are blanched in the same way, the roots being put into pots and boxes, and soil packed round them after they have shed their leaves in late autumn, or by covering the roots with pots or long narrow boxes, and again covering them with fermenting leaves, &c. *H. W. W.*

INDIA.

The authorities at Kew, in conjunction with the Government of India, have devised a scheme for the organisation of a botanical survey of India, and the welding of the scattered departments into a federation with the Calcutta Botanic Garden as the centre. The details of the scheme are given in the current number of *Nature*, from which we condense the following particulars, noting, by the way, that this is only another illustration of the general principle upon which the Director of the Royal Gardens, Kew, is working to secure a regularly organised Botanical Department for the whole empire, varied in detail according to circumstances and requirements, and of which the staff shall be so selected, that any man who enters may rise by successive steps to the higher positions.

The Botanic Garden, Seebpur, Calcutta, is officially recognised as the acknowledged centre of the Botanical Survey of India, to which should be referred the solution of all problems arising out of the practical or scientific study of Indian botany. Dr. King, the Superintendent of the Royal Botanic Gardens, Calcutta, thus becomes, henceforth, the Director of the Botanical Survey of India. Dr. King will specially undertake the direction of the botanical survey of Burma and Assam.

The investigation of the Flora of the Madras Presidency and of the Hyderabad and Mysore States, has been entrusted to Mr. M. A. Lawson, the Government Botanist and Director of Cinchona plantations.

In Bombay, Dr. Cooke, Principal of the College of Science, Poona, is officially recognised as in charge of botanical research in that presidency.

The Director of the Botanical Department, Northern India, is Mr. Duthie, formerly the Superintendent of the Botanic Garden, Saharanpur. Mr.

Duthie accompanied the Black Mountain Expedition, and acquired information concerning the flora of the country, which had, hitherto, not been botanically explored. During the last three years, Mr. Duthie has also been deputed to Simla, in the hot weather, to assist in the preparation of the *Dictionary of the Economic Products of India*, and during the same period he has been actively engaged in the botanical exploration of Rajputana and the central provinces. Neither the Straits Settlements nor Ceylon are included in the scheme, they being Crown colonies. The arrangement is, therefore, as follows:—

Under the Superintendent, Royal Botanic Gardens, Calcutta (Dr. King)—

The provinces of Bengal, Assam, and Burma; the Andamans and Nicobars, North East Frontier, expeditions.

Under the Government Botanist of Madras (Mr. M. A. Lawson)—

The Presidency of Madras, the State of Hyderabad, and the State of Mysore.

Under the Principal, College of Science, Poona (Dr. Cooke)—

The Presidency of Bombay, including Sind.

Under the Director, Botanic Department, Northern India (Mr. Duthie)—

The North-Western Provinces and Oudh, the Punjab, the Central Provinces, Central India, Rajputana, North-West Frontier expeditions.

PLANT PORTRAITS.

AERIDES AFFINE VAR. *GODEFROYANUM*, *Revue de l'Horticulture Belge*, August 1, 1891.

CYDONIA JAPONICA ALBA, *Garden*, Aug. 8.

CYMBIDIUM ELEGANS, *Orchid Album*, t. 430.—A handsome species, with a pendulous, densely packed raceme of yellow flowers.

CYPRIPEDIUM ENGELHARDTII, *Lind.*—A hybrid between *C. insigne* Mauli and *C. Spicerianum*. The upper sepal has the colouring of the first-named, but the petals and lip are of a golden-yellow. A remarkable plant. *Lindenia*, t. 285.

CYPRIPEDIUM LAWRENCEANUM VAR. *HYEANUM*, *Orchidophile*.

DIPLOTA YUNNANENSIS, *Revue Horticole*, p. 247.—A shrub allied to *Diervilla*, and a native of Central China. It is described by M. Franchet as having white flowers veined with brown.

DIPLADENA THOMAS SPEED.—Flowers white, with a golden throat, *Revue de l'Horticulture Belge*.

DRYMOPILEUS OLIVIFORMIS, *Garden and Forest*, July 15.—A representation of a fruiting specimen of this Palm.

FRANCISCEA CALYCINA GRANDIFLORA, *Garden*, July 26.

GERANIUM ARMENIUM, *Revue Horticole*, August 1.

IRIS ALATA VARIETIES, *Gartenflora*, July 15, t. 1351.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

PINES.—Any potting that is required should be done as soon as possible, so as to get root growth made, for unless the plants have plenty of roots they can hardly be expected to make much progress when required in the early part of the year. Newly-potted plants should get plunged in a mild bottom heat of 80° to 85°, and not have much moisture at the roots. I like a frame or pit with a steady heat for plants at this stage, as if unduly excited now they often throw imperfect fruits. Suckers should still be potted up, using the stronger stock for the purpose, and not too large pots. A frame may be used for a time, covering it at night so as to maintain an even temperature. In frames, the great danger arises from excessive moisture, so that only those suitable should be used for the young stock.

Successions coming into fruit may get occasional supplies of liquid when in robust condition. Less shade will now be required, and therefore less moisture; still, a moist growing atmosphere must be maintained, with fire-heat in dull weather. Those swelling up need similar treatment, avoiding too much moisture overhead. A batch of late fruiters should now be selected from the Cayennes, Roths-

childs, and others, and, if possible, a pit or house devoted to them, so as to give them more atmospheric moisture, with less air than those plants that are to fruit next spring, closing early, and only shading for a short time, if necessary, in the middle of the day. Some fresh manure-water should be placed in the evaporating pans, for the next few weeks, once or twice a week. Ripe fruits should be removed to a cool room; if required to keep some-time, they should be suspended by the stalk. Queens that are finishing their fruits should get a dry cool atmosphere, and a free circulation of air to prolong the fruiting period as long as possible.

LIFTING UNHEALTHY VINES.—This period of the year is a good time to undertake this work, if the crop is secured, and the wood matured. In the case of Vines which shank, weak foliage, or exhausted borders with the roots at the bottom, now is a good time to begin lifting. The old soil should be removed with a fork, beginning at the outside, and the old material taken away; the roots all carefully preserved by laying them in damp mats, and keeping them moist, taking care to save all fibrous roots, and if found in a bad state, the work should be vigorously proceeded with, the border remade all through, if necessary, with new drainage, not omitting to put in drain pipes to secure fresh air to the drains, to keep them sweet—this is readily done as the work proceeds. The old decayed roots must be cut back to a live part, and the small fibrous roots carefully spread out, and all kept as near the surface as possible, making the new compost firm, and in doing so, taking care in ramming not to injure the roots. If the roots are very bad, the border can be narrowed, and not made up to the allotted space; this can be completed another season. A layer of fresh stable litter should be put over the surface when finished, the border being well saturated with tepid water, and the house kept shaded and close, also syringed several times daily. In most cases a restricted border will be best, adding soil as the young roots come to the outside in after years. In lifting, the important part of the work is to get the roots re-covered without exposure, to keep the air close and moist, and to give the roots a good compost of turfy loam, old mortar, crushed bones, and charcoal or wood ashes. Loam being the principal material, it should be as sound as possible, not too light or poor; and it is also advisable to use plenty of wood-ashes, charcoal, and old mortar, in preference to a large quantity of decayed manure—the latter, when used to excess, especially with a deficiency of roots, causing the new material to become sour before the young roots can take hold of it. I find Thomson's Vine Manure the best and safest for this purpose, and would only use the animal manures as a top-mulch on the surface. With newly-lifted Vines a little extra care is required for a few weeks by careful airing and shading, and as the foliage assumes an erect, firm state, more air and less shade will be required. It is surprising how soon old Vines take to their new conditions if kept moist by syringing and damping all parts of the house. The greatest difficulty is with very late Grapes, or in unheated houses, but these may successfully be operated on just before the Vines break, but it is a delicate work, and requires despatch and experience. I would rather advise starting much earlier, and getting the crop taken, and doing the work in the autumn, as there is a certainty of success at that season; besides, when done early in the year, the Vines flag in the summer, and do not do nearly so well. It is also advisable to crop very lightly the first season, and not force hard, allowing them to break naturally, as forcing and cropping heavily would certainly undo the good that had been secured by lifting them. They should be permitted to grow freely, and the terminals allowed free run, stopping the laterals when they touch to prevent crowding. *G. Wythes, Syon House, Brentford.*

PLANTS UNDER GLASS.

BOUVARDIAS.—Young stock planted out in pits or frames will have made much more growth than those grown in pots, and where it is intended to take the plants up and pot them, there should be no delay in doing it, or the roots will not take sufficient hold of the new soil, and the plants will not bloom satisfactorily. Care will be necessary not to injure the plants in any way when potting or lifting them. A compost consisting of three-fourths good loam, one-fourth rotted manure and leaf-mould in equal quantities, and sand in due proportion, will be found suitable for these plants. The potting should be done moderately firm, and the plants stood in a house

where they will get sufficient light, and enough heat to induce some amount of top and root growth. Keep the house or pit rather close for a few days, and use a thin shading during the middle of the day when the weather is bright. Syringe lightly overhead in the afternoons at closing-time, but avoid giving too much water before the roots begin to take to the fresh soil. Bouvardias in pots, which have been kept in pits or frames during the summer, should be shut up early in the afternoons, so as to induce them to grow freely during the next few weeks; and, if possible, have them placed in a pit where a little fire-heat can be turned on at nights, and in the day time also in cold wet weather. A small quantity of weak manure occasionally will assist them. Keep all flowers picked off for the present.

MIGNONETTE.—At the present time sow seed of Mignonette for flowering in the winter, later sowings not having sufficient time to get well established before winter sets in. The seeds may be sown in 32's, using a compost consisting of half good loam, and a quarter each of rotted manure and leaf-mould, and a fair sprinkling of sand and old mortar broken small, mixing the whole well together; have the pots well drained and filled with the above compost to within 1 inch of the rim, sowing the seed evenly, but not too thick on the surface, afterwards covering the seed lightly with the finer portions of the compost. Place the pots in a cold frame, in a sheltered but sunny position; damp the soil lightly with the syringe till the seedlings appear, and shade them when the sun is bright. Thin the plants as soon as they are large enough to handle, but it is always advisable to leave a few more plants than will remain finally, when about four plants should be left in each pot. The plants may be grown in frames till there is danger of severe frost, when they should be removed to a light position in the greenhouse.

CAMELLIAS.—All these plants should now be examined, the leaves cleared of dirt and scale. The white scale is one of the worst of plant foes to deal with, as but few plants can bear so strong an application of an insecticide, as is necessary to kill the insects. Plants having this species of scale insects, should have the strong wood cleaned with a hard brush, and the leaves with a sponge or soft brush. Now that the baneful practice of cutting the shoots of Camellias when taking the flower is generally discontinued, the extra vigour which is thrown into the plants by the side shoots being left intact, causes the bloom-buds to set in much larger quantities, and calls for more thinning of the flower buds. This operation of bud reduction should be done at once, two or three buds only being left on each shoot.

Plants growing in beds and borders sometimes make a second growth at this time of the year instead of setting their flower-buds, but this is usually caused by over-much water being afforded them; and any plants which show signs of this should have water withheld entirely for a time, which they will bear without dropping their buds, as would follow this course of treatment were the plants growing in pots. *R. Milner, Penrice Castle, Swansea.*

THE KITCHEN GARDEN.

WINTER CROPS.—Now that the various plantings of Brussel Sprouts, winter Greens, Broccoli, &c., have obtained a good start, they should be gone over, all discoloured leaves removed, and the ground thoroughly cleared of weeds. The plants should be supported by having the soil drawn up to the stems. Continue to plant out on rich ground more Early London Coleworts and the hardy green variety; also early kinds of Cabbage of those sown in June.

CARDOONS.—Keep the stems of these plants in an upright position by gathering them together and tying them with matting. A stake should be put to each plant to prevent injury by rough winds.

GLOBE ARTICHOKEs.—Remove all old flower-heads and stems as these by remaining impoverish the plants. Those planted out in spring should be afforded liquid-manure, and, on light soils, should be mulched with decayed manure. These plants, if liberally treated, will produce fine heads in September and October.

CRESS.—A few rows of American, Australian, and Normanly Cress should now be sown. These take the place of Watercress in winter. Sowings should be made in such a position that they can be covered with glass or mats in severe weather. The leaves should not be cut like curled Cress, but the

outer ones should be picked at short intervals, and the plants will then continue to push forth fresh ones. There is but little danger of it running to flower at this season.

RADISHES.—A good sowing of these should be made on well-prepared soil. Slugs are very partial to them. Dustings of soot and wood-ashes will be found good preventives; but it is best to catch them, which is not a difficult task, if a few Cabbage or Lettuce leaves be laid about, and every morning examined, and the slugs killed.

PARSLEY.—The rougher leaves should be cut off, in order to induce robust growth. To enable the plants to withstand the winter, transplant the thinnings into blank spaces in the lines. Dust the plants with soot, and keep the hoe plied amongst them. Put some at once into cold frames or pots, so that in the event of hard weather, there may be some leaves to pick. When Parsley is swept clear of snow to obtain a picking, many of the plants perish. A sowing on a warm and rich border may yet be made, and should it withstand the winter, it will be found of much value in the early part of the summer.

TURNIPS.—In favoured districts these may still be sown. Thin out the plants of earlier sowings, and ply the hoe amongst these and all other crops until they cover the ground.

ENDIVE.—Plant out from the seed-beds at intervals sufficient quantities to form a succession. These plantings should be available for giving a supply throughout the winter; both for bleaching on the ground, and also for lifting and storing into frames. More forward plants should be prepared for use, either by being tied up or by having flower-pots put over them whilst dry; these will be bleached and ready for use in about eight or ten days from the date of covering. Where suitable accommodation exists, another small sowing can be made in a cold frame, to be afterwards transplanted into others for very late spring use. In making provision for the winter supply of Endive, preference should be given to the Batavia variety; it stands frost better than the curled one, keeps longer in a usable condition, and being tender and less bitter in flavour, is generally in great request for salads during the winter months.

LETTUCES.—Good provision should also be made of these, by planting out from the seed-beds all the most forward and strongest plants. Both Lettuces and Endive should be allotted warm, sheltered borders, and good, light, rich ground.

ONIONS.—These should be taken up when the tops and necks drop and begin to shrivel, and allowed to remain on the ground for a few days in fine weather, turning them over frequently, so that they may become thoroughly ripe and firm, choosing a bright sunny day to store them; an airy dry shed should be selected, wherein to place them for a time on open shelves, spread out thinly, afterwards to be sorted and cleaned. This is a suitable time for harvesting seeds; when they are not sufficiently ripe and matured at the time of gathering, they should be placed under conditions favourable for drying slowly. *C. J. Waitt, Glenhurst Gardens, Esher.*

THE HARDY FRUIT GARDEN.

ALL fruit trees pruned early will now require the young shoots to be stopped and trained. The double and single lateral cordon Apples, trained to wires for an edging, should have the leaves overhanging the fruits snipped off so as to obtain good colour and size. These tiny trees usually crop heavily when properly root pruned, &c., and they should be freely thinned, and some assistance afforded them to produce fine samples. Repeated applications of liquid manure, guano, or other suitable manures, should be given them early, and if the soil be light, surface root-ers should be mulched with manure, and subsequently drenched with slightly tepid water to wash down the manurial properties. As the young growths appear pinch them, while the ends which may not have filled their allotted space should be carefully tied to the wires with soft bast, taking great care not to tie them too tightly, or they may get injured.

UPRIGHT CORDONS, which usually, or ought to, consist of the choicest Pears, should receive all necessary attention, keeping the soft breast-wood stopped hard back, while some of the leaves may be clipped backed to freely expose the fruit to the light. Do not over-crop, but thin freely, to allow the trees to build up for another season's crop. Trees planted

on a well-prepared border, if limited, should be mulched, and frequently deluged with slightly tepid water; this will greatly improve the size of the fruit, as well as the flavour. Clapp's Favorite, Williams' Bon Chrétien, and B-arrié d'Amanlis Pears may be gathered a few at a time, and put aside to ripen. Do not let these Pears hang too long on the trees; the flavour is never so good, neither do they keep so well as when gathered a trifle under-ripe. To follow these, Malme Freyve, Triomphe de Vienne, Fondante d'Automne, Louise Bonne of Jersey, &c., will be found capital sorts, but these will not be ready to gather yet.

HORIZONTALS AND ESPALIERS trained should also be gone over again, and the young sappy growths cut off. But any which may not yet have been summer pruned should be shortened closer than those done early. Let all this work be finished off as fast as possible, going over young standards and thinning out the heads where too thick, spurring in the inner shoots to four buds. The shoots of Nuts should also be shortened if not done—not too closely, while the suckers and all useless spongy wood should be cut away entirely.

Grafts will also require looking after, and if the scions have taken well, and made good growth, they should be shortened back, especially standards, thus lessening the danger of breakage by wind. Remove the ties, and strip the stems of useless young wood. See that good labels are provided, and a note kept of all the sorts. Remember where there is any grafting to be done in the coming spring, to reserve shoots of the most suitable and best kinds especially for that purpose. *H. Markham, Merworth Castle, Malton.*

THE ORCHID HOUSES.

THE CATTLEYA HOUSE.—In this house are grown usually, the *Lelia purpurata* and *L. elegans* in variety, the chief rooting season for which is now coming; and any plants which may be in an unsatisfactory state should be repotted, great care being observed in the carrying out this work, especially in getting well-rooted plants out of the pots. I always break the pots gently, and with a thin knife detach the roots from the sides of the pots, the best knife for this purpose being a painter's pallet-knife; but roots which are attached to the crocks are allowed to remain intact, and carefully placed in the new pots, other potsherds being placed around them so as to secure proper drainage. Good fibrous peat and sphagnum moss are all that is necessary for packing about the plants, inserting here and there pieces of clean crocks. But small quantities of sphagnum should be used with these *Lelias*, just inserting a piece here and there upon the top to serve as a tell-tale when the plants are getting dry. After re-potting, the plants should be kept from the direct rays of the sun until it can be seen that the new roots are pushing into the new material; water should then be afforded, and not before, observing always to use the materials in a moist condition.

THE ODONTOGLOSSUM HOUSE.—The season has again come when preparation should be made for re-potting the whole of the occupants of this house, clean pots—new ones if possible—clean potsherds, and good fibrous peat, being employed. If in turning the plants out, they should be found to be very firm in the pots, it is better to break the pots than sacrifice the roots. When the plants are taken out of the pots, every particle of the old material should be removed from the roots with a pointed stick, rinsing the latter in rain-water. In repotting a well-rooted *Odontoglossum*, the new pot must not have the crocks for drainage placed in first, but one piece only should be placed over the hole, then the roots should be carefully placed in, and other crocks added, one at a time, taking care not to crush the roots when doing this. Although this may seem a rather tedious operation, it is not in reality, and a large number of plants may be got over in a day with a little practice. As the potting of each plant is completed, the pot should be just dipped quickly under water up to the pseudo-bulbs, this will moisten the top of the compost without making it soddened. I should have previously remarked that *Odontoglossums* must be potted firmly. Abundance of air should be afforded at the top of the house at night, when it will be found that the plants, in the early morning, are covered with condensed moisture. The temperatures in the warm house may remain as given in my former calendar, but no fire-heat should be employed for *Odontoglossums* for some time to come. *A. G. Catt, Parkfield, Hallou.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

FRIDAY, SEPT. 4 { National Fruit Growers' Association, at the Crystal Palace.

SHOWS.

TUESDAY, SEPT. 1—Kelso.

WEDNESDAY, SEPT. 2 { Stirling (two days).
Paisley (two days).
South of Scotland, at Dumfries.
Glasgow and West of Scotland.
Bath (two days).
Royal Caledonian, at Edinburgh (three days).

THURSDAY, SEPT. 3—Dundee (three days).

FRIDAY, SEPT. 4 { Crystal Palace Fruit and National Dahila, held together (two days).

SALES

MONDAY, AUG. 31 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Dutch Bulbs, at Stevens' Rooms.

TUESDAY, SEPT. 1 { Dutch Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, SEPT. 2 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Liliums, &c., at Stevens' Rooms.

THURSDAY, SEPT. 3 { Dutch Bulbs at Protheroe & Morris' Rooms.

FRIDAY, SEPT. 4 { Imported and Established Orchids, at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 5 { Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—59°·8.

The Co-operative Flower Show. THE very successful festival, to which we alluded last week, marks an era in the history of horticulture. This show was very large, the entries reaching to about 4500, and the quality is improving as each successive exhibition comes round. But important as these qualities are, they are the least important of the many that give to this festival of labour its peculiar value and special importance. For at this annual exhibition there was not only a muster of the trophies and the successes of co-operative production and distribution, but we had horticulture in its most charming guise as a handmaid to industry.

These annual festivals tend directly to the ennobling of labour. Continued and extended, they will do much to abate the sweating system, and substitute homes for hovels wherever the latter still exist in town or country. Many considerations powerfully impressed us at the festival, such as the position of the exhibitors, and the quality of their products, considering the circumstances and conditions of the growers. Could the histories of these conditions be revealed, some of them would prove as pathetic, and far more instructive than many novels. Here are cases of defeat, of success, and of non-showing, as illustrative of the spirit of these co-operative workers:—

A man was holding up his Turnips—enormous samples of green-topped farm ones, and by far the largest in the show—in evident surprise that they could have been prizeless. "Too big and coarse, my friend, for the Palace, but capital for the cow on the three acres," dissolved the gathering frown into a cheery smile. It seemed he had taken twelve firsts, and was rather apologising to his group of friends for defeating them so often.

A third, a railway guard, was deeply absorbed

among the Begonias. "Have you been successful?" "No, sir; having to run up a special this morning, I could not attend to them myself on the journey nor here, and so I left them at home, though I could have beaten the best here easily; for you must know, Begonias are my hobby, though I have to grow and train them almost wholly by lamp-light, and an hour or so among them rests me so after my long runs."

And so on inquiry it will be found at these festivals that the miner, the weaver, the millhand, the bricklayer, the blacksmith, the carpenter, the mason, the mechanic, find rest from their monotonous toil among their flowers, fruits, and vegetables. Nor is rest only found in such pursuits, but greater power for labour and life in industrial enterprise. For as was well pointed out by Mr. D. T. FISH and Mr. WRIGHT, in declaring the Co-operative Flower and Fruit Show open, at the request of Mr. GREENING, this was a great technical school for making the heads of all these industrial workers more wise, and their hands more skilful. If such is the effect on those most familiar with plants and their products, who shall estimate their education and influence on practical workers, seeing them for the first time? Certain it is there was no sign in that great busy hive of industrial workers in the Palace, of those apathetic dullards of whom the poet contemptuously sang—

"A Primrose by the river's brink,
A yellow Primrose was to him,
And it was nothing more."

Now these flowers, fruits, leaves, vegetables, were Roses, Stocks, Mignonette, Apples, Pears, Plums, Gooseberries, Currants, Peas, Potatoes, Beans, Tomatoes, Marrows, &c., to these hard-headed, horny-handed co-operatives, and they were much more—furnishing for example, higher ideals, purer pleasures, better health, greater plenty, and purer life.

So much has been said of the exhibitors, that there is little time left to praise their products. It may be said of them in the mass what GEORGE ELIOT said of the women, that they matched the men—that is, in this case, the exhibitors. Improvements on former shows were chiefly in two directions. There were fewer bad exhibits, and greater variety in the good samples. In most classes there were still a few samples staged that ought to have been left at home or rejected by the committee. But on the whole, the exhibits in all departments were excellent, and there was no one interested in the food question but must have marked the enormous increase in the entries of Tomatoes, Vegetable Marrows, Cucumbers, Peas, Runner and French Beans, Shallots, Beet, Lettuces, and even Onions, with special pleasure. When these shows were first started, Potatoes, Broad Beans, Cabbages, and Onions largely occupied the space. Besides collections of Vegetables in competition from the northern, southern, and western districts of England, there were in one class of the great show alone, that from members of industrial co-operative societies only, sixty-seven dishes of Runner Beans, forty-two of French Beans, forty-five of Broad Beans, sixty-nine of Beet, seventy-nine of Onions, eighty-six of Peas, forty-six of Shallots, forty-nine of Vegetable Marrows, and twenty-six of Tomatoes. Carrots, Turnips, and Potatoes were plentiful, and fine as usual; while Celery and Cucumbers were more numerous, and there were no fewer than forty-eight dishes of Lettuces. These facts suffice to show great changes in the food supply of the people, and if it be true, to some extent at least, as some affirm, "that as a man eateth, so is he," it follows that these great industrial exhibitions and festivals of labour must have

a material influence on the physical health and industrial development of the nation.

Adon Mount,
Dulwich.

THIS is situated on a hill overlooking Dulwich Park, commanding extensive views of the country.

The situation is bleak, and the soil poor, being London clay, with outcrops of Woolwich and Reading gravel. Many thousands of tons of turfy loam from neighbouring fields, which are being rapidly built upon, have been brought here, and this will account for the luxurious growth and wealth of flowers to be seen in the garden, which covers about 4 acres.

The garden, with the exception of small spaces reserved for lawns for tennis-ground, is one huge herbaceous border. One long vista, a green path overlooking Dulwich Park, is very effective. The apparent confusion of flowers has, however, been studied, for we see a large mass of *Tropeolum canariense* growing up a stump along with *Clematis Jackmanii*; and beneath these clumps of *Coreopsis* and *Gaillardias*, associated with blue Cornflowers, the blue and yellow forming a pretty contrast. The great mass of the plants consists of the hardiest herbaceous plants, such as Foxgloves, *Harpalum rigidum*, *Rudbeckia*, (*Eurotia*, seedling *Hollyhocks*, both double and single; *Helianthus*, *Anemone japonica*, &c., as well as hardy annuals, e.g., Poppies, in great profusion and variety; *Campanulas*, *Delphiniums*, *Phlox Drummondii*, *Geletias*, *Nasturtium*, &c. Excepting in the places occupied by spring-flowering bulbs, where *Asters* and *Pelargoniums* are planted, the whole of the ground is completely covered by herbaceous plants, which are allowed to grow without any attention beyond removal of dead leaves and flowers. Such gardens as this are almost independent of the weather, for in this wet month the *Phloxes* are looking splendid; whilst, if it had been hot and dry, the *Gaillardias* and similar plants would be far better. In spring, a nook outside the ubiquitous border is filled with *Daffodils* and *Primroses*, and hereabouts a little pool suffices for the culture of water-plants.

Our illustration (fig. 31, p. 250), represents the most formal portion of the garden; it is a view of the south side, and shows a series of terraces formed by walls of concrete. These terraces are planted with Poppies, Foxgloves, Heaths, *Thalictrums*, *Iris*, and other plants, the walls being covered with variegated *Ivies*, which being slow in growth, are very suitable for such places. The seeds of the annuals are mixed with soil, and simply scattered about and allowed to grow almost in any place.

There is, of course, a kitchen garden, though the vegetables are well nigh crowded out with the Poppies and other herbaceous plants. There are several glasshouses, one conservatory being built over the billiard-room, which is lighted by a window in the middle of the floor of the conservatory; another, a cold vinery facing south is planted with Black *Hamburgh* grapes, and is utilised as a smoking-room—good crops of grapes were ripening at the time of our visit. Tomatoes are grown in a house devoted to them; when they are turned out of thumb-pots they are planted upon a stage made of concrete, and the roots just covered with soil, which never exceeds 3 inches in depth, but more is added as the roots appear on the outside. Judging from the crop, this plan appears to answer well.

If we might venture to suggest any change in this remarkable garden, it would be that a larger admixture of the best hardy evergreen coloured-leaved and deciduous flowering shrubs be made.

HER MAJESTY'S GARDENER.—We are informed that Mr. JONES, who for many years has had the direction of the gardens at Windsor and Frogmore, is retiring from his arduous duties. We were under great obligations to Mr. JONES at the time of the publication of our illustrated Windsor Supplement, as well as subsequently. We are glad to be able to congratulate Mr. OWEN THOMAS, of the Chatsworth Gardens, on his appointment to succeed Mr. JONES. The task is, no doubt, onerous and difficult, but Mr. THOMAS is, we believe, thoroughly fitted for the post, and we wish him all success in his new undertaking. Mr. THOMAS enters on his new duties on October 1.

Germany, and has not one at all resembling the parent; and amongst the seedlings are heavy red-edged, rose-edged, scarlet-edged, a fancy crimson-maroon Carnation, and a very large yellow-ground fancy Picotee. He also exhibited several varieties, including his fine seedlings, as well as the new sorts of BENARY'S and others. Mr. ROBERT SYDENHAM also sent a fine collection. A good discussion followed.

STORIES OF SENTIMENT.—By H. KAINS-JACKSON (ELLIOT STOCK).—This little book contains six or seven tales, all relating to various forms of the same "sentiment"—love. All are readable and inter-

esting, we find no mention of the remarkable work of the late Professor ALEXANDER DICKSON.

"MEEHAN'S MONTHLY."—The second number opens with a coloured plate of *Nuphar advena*, the American representative of our common yellow Water Lily. JOHN BARTRAM'S garden has, at the instance of Professor MEEHAN, been secured as a public park for the citizens of Philadelphia. Many of the fine trees planted by BARTRAM still remain.

FLORA OF CHINA.—The last issued part of the *Journal of the Linnean Society* (vol. xxvi., n. 176), contains the continuation of the enumeration of all

FIG. 31.—FLOWER GARDEN AT ADON MOUNT, DULWICH. TERRACES ON SOUTH SIDE. (SEE P. 250.)

W. T. THISELTON DYER, PH.D.—We are pleased at the opportunity of offering our congratulations to the Director of Kew on the occasion of his receiving the honorary degree of Doctor of Philosophy from the Imperial Leopoldine-Caroline Academy of German Naturalists, the oldest Scientific Society north of the Alps. The compliment is proportionate to the merit of the recipient.

BIRMINGHAM GARDENERS' ASSOCIATION—At a special meeting, August 19, Mr. C. H. HERBERT, of the Sparkhill Nurseries, read a paper on the Carnation and Picotee, giving details of cultivation, propagation, and his results of fertilising. Mr. HERBERT saved seed from BENARY'S superb yellow

resting; some would be still more so, were they less burdened with incidents bearing but slightly upon the plot. The characters are cleverly sketched, the scenery domestic yet not too commonplace. The book is clearly printed, on good paper, the cover neat and legible, and not gaudy or disfigured by a crude coloured illustration.

"DICTIONNAIRE DE BOTANIQUE."—Two numbers of this very useful publication are before us, bearing testimony to the diligence and care of Mr. BULLON. The third volume is now complete, and the fourth volume opens with a part which carries the text as far as "Smer." Under the head of

known Chinese plants, by J. B. FORBES and W. B. HEMSLEY. The present part brings the work down to the Daphnes (*Thymelacææ*). Chinese Rhubarb is the produce of *Rheum officinale* and *R. palmatum*. Several new Lauracææ are described and illustrated by Mr. HEMSLEY. The "Enumeration" is very serviceable to all who are concerned in the flora of China, and we trust that when it is completed, a supplement may speedily be given containing the species described in France and elsewhere since the publication of the earlier parts.

MUSSEL, BRUSSELS, AND BROMPTON PLUM STOCKS.—Frequent enquiries reach us concerning

the origin of these various stocks, employed by nurserymen for Plums, Peaches, &c., and but little seems to be known with certainty about any of them. Mr. W. PAUL, of Waltham Cross, in reply to our inquiry, says:—"I am quite unable to tell you when the Mussel, Brompton, and Brussels stocks originated, nor have I seen it stated in any work on gardening from what source they have been derived. ROGERS, in the *Fruit Cultivator*, third edition (1837), p. 359, says of the Mussel:—"It is a wild sort, but where it was first found is unknown; it has, however, been used as a stock for Peaches and Nectarines for the last 150 years." I have not the least doubt that all these stocks were originally selected from sowings, natural or artificial, of seeds of cultivated Plums. Certain seedlings appeared to the eye and mind of the experienced horticulturist likely to prove of value for stocks, and were consequently preserved, propagated, and, confirming the anticipations of their possessors, handed down for general use."

FRUIT CROPS IN KENT.—A correspondent at Sittingbourne reports that there are enormous crops of Pears and Plums in that district, but only a short crop of Apples.

THE GENUS MASDEVALLIA.—The second part of this monograph, issued by the Marquess of LOTHIAN, with the assistance of Miss WOOLWARD, has just appeared. It is uniform with Part I., reviewed in this journal last January, and contains drawings and descriptions of the following ten species,—*Masdevallia civilis*, *M. corniculata*, *M. cucullata*, *M. infracta*, *M. leontoglossa*, *M. maculata*, *M. picturata*, *M. Reichenbachiana*, *M. Schlimii*, and *M. Tovarensis*. The beautiful hand-coloured plates and the full and accurate scientific descriptions, with the interesting historical and biological notes of each species, from Consul Lehmann and others, are all of as high a standard as those we criticised early in the year. The present number includes *M. infracta*, the oldest species after *M. uniflora*, on which RUIZ and PAVON founded the genus in 1798. *M. infracta* was discovered by DESCOURTILZ, a French traveller and botanist, in 1809, but it was not till 1833 that LINOLEY published the first description in his *Genera and Species of Orchidaceous Plants*. It is of great interest to the student of geographical distribution, for its only known habitat is the Organ Mountains in Brazil, about 60 miles north of Rio Janeiro, and according to Mr. VEITCH'S *Handbook*, "upwards of 2,000 miles from its nearest ally in the Peruvian Andes." Miss WOOLWARD is also very clear about *M. picturata*, a species once confused by REICHENBACH with *M. meleagris* of LINDLEY, which, however, appears to be quite distinct. This charming little plant grows as far North as Costa Rica, thus representing almost the Northern limit of the genus as *M. infracta* does the Southern. We shall look forward with renewed interest to the appearance of Part III.

FLOWER-BEDS AT KEW.—In the Royal Gardens may be found, as is most appropriate, various modes of bedding to illustrate various styles, and to gratify different tastes. The old style of bedding is happily much less rampant throughout the country than it used to be, and those who wish to know what to substitute for it should see the numerous beds at Kew. Among them we may mention one of *Galtonia candicans*, intermixed with a small-flowered *Fuchsia*, beds of *Lilium longiflorum* by itself, and associated with dark foliage beds of *Anemone japonica* and other select *Hypericum Moserianum* × plants, as *Hydrangea paniculata grandiflora*. It is in such matters that Kew should set an example, furnish object lessons, and leave the authorities of the parks to follow their own more hackneyed course.

HOLLYHOCKS.—Messrs. STUART & MEIN send samples of a fine collection of Hollyhocks, the flowers are large, well-formed, globose, full, and varied in colour. Among them are *Crimson*, primrose flushed with buff; *John Findley*, dark red; *Cygnets*, white; *Pride of Laxton*, cream-coloured,

flushed with pink; *Robert Martin*, pale red; and *Conquest*, deep red.

PRESENTATION AND FAREWELL SUPPER TO AN EDINBURGH NURSERY EMPLOYÉ.—Mr. JOHN DAVIDSON, for a number of years foreman of the fruit tree department of Messrs. DICKSONS & Co., was entertained at supper on Saturday last in the Royal Exchange Hotel, Edinburgh, prior to his leaving Scotland to try his fortune as a fruit grower in California. The occasion was taken advantage of by numerous professional friends and brethren of the British Order of Ancient Free Gardeners—in which order Mr. DAVIDSON has been an able worker—to give tangible expression to their appreciation of his worth. By the Grand Master of the Order he was presented with a cheque for a handsome amount; by Mr. PEALING, florist, Edinburgh, with a purse and money on behalf of the Eden Lodge of the Order, and on behalf of the members of the east of Scotland district with a gold Albert chain and appendage. Mr. DAVIDSON is an enthusiastic pomologist, and carries the best wishes of a wide circle of friends and professional brethren with him to the land of his adoption.

REICHENBACHIAN ORCHIDS.—Owing to the peculiar restrictions imposed by the late Professor REICHENBACH in his will, it is not possible to consult the original specimens which formed the materials upon which many of his species are described in our columns. Under these circumstances, any grower who may happen to have flowering specimens of any plant named by the late Professor, will confer a great benefit on horticultural science by transmitting a specimen for preservation to the Herbarium of the Royal Gardens, Kew. Such specimens should be sent to the Director, Royal Gardens, Kew.

THE JARDIN DES PLANTES.—The Director, Professor CORNU, has issued a list of plants offered in exchange to other botanic gardens and institutions; amongst them are some undetermined species from Tonkin and Yunnan.

"AGRICULTURAL GAZETTE" OF NEW SOUTH WALES.—The May number contains illustrated articles on the grasses of the Colony, by Mr. F. TURNER, Botanist to the Department of Agriculture.

CARDIFF CHRYSANTHEMUM AND FRUIT SHOW will be held on November 18 and 19 next, not on November 11 and 12, as in National Chrysanthemum Society's schedule.

THE AVOCADO PEAR has fruited this season in the open air at Golfe Juan, Nice, and a figure of the fruit is given in the *Revue Horticole*.

THE SHREWSBURY FLOWER SHOW.—The gross receipts of the exhibition from all sources, amounted to the large sum of £3000; including gate-money, on the first day, £351 16s.; and on the second day, £1413 11s.; tickets sold beforehand, £625; subscriptions £400. Fifteen thousand visitors attended on the first day, and 45,000 on the second.

CONTRIBUTIONS FROM THE UNITED STATES NATIONAL HERBARIUM.—The last part contains a list of the plants collected by Dr. EDWARD PALMER in western Mexico and Arizona, drawn up by Mr. J. N. ROSE. Eleven plates illustrate the report. *Tabebuia Palmeri* is a beautiful flowering tree with large Paulownia-like flowers, light mauve at the base with white and yellow patches. The wood of this tree is hard, and is used for building purposes.

MISHAPS TO FLOWER SHOWS.—The Newcastle Show, which was to have been held in the Leazes Park, promised to be a great success, fifty more entries than at any previous show having been received. A terrific gale raged all the previous night, and towards the morning it increased in violence; about 6.30 A.M. the tents were blown over with a terrific crash. The devastation was such, that the whole had to be cleared away. Fortunately, few exhibits were staged. The large Palms, Coniferae, and some hardy trees

and shrubs, had been laid on their sides. A collection of plants from Mr. WATSON of Newcastle, received some damage; but the ruin everywhere to the tents, &c., was so complete that the committee, after holding a meeting on the grounds, at which the Mayor of Newcastle was present, determined not to hold the exhibition in any form. The plants in vans, and fruit, flowers, &c., sent by railway were returned unpacked; and at the time when the judging usually commenced, the torn canvas, split poles, &c., were nearly all packed up ready for removal. The tents at four other local exhibitions in this neighbourhood have been blown down during the last three weeks; but none has been so completely ruined as that of Newcastle-upon-Tyne. The storm raged also along the Irish coast. The annual flower show of the Royal Horticultural Society of Ireland, which was opened on Tuesday, August 25, in Lord IVEAGH'S grounds in Stephen's Green, Dublin, and was to be continued on the following day, was completely ruined by the storm. The grounds presented a sad spectacle, the four large tents in which the exhibits were displayed, being uprooted from their fastenings, and the flowers and fruits scattered about in all directions.

BRITISH FRUIT GROWERS' ASSOCIATION.—At the Conference to be held by the above Association in the Crystal Palace on September 4, at 4 P.M., the subjects for discussion will be—"Pruning," and "Gathering, Packing, and Storing Fruits," to be introduced by practical addresses. At Edinburgh, the Conference is to be held in conjunction with the International Show on the second day, namely, September 10, at 3 P.M. The programme will include an address on the "Present Condition and Prospects of Fruit Culture," "Fruit Culture for Profit in Scotland," "Strawberries for Market," "Gathering, Packing, and Storing Fruits," and several other important subjects. Further particulars can be had on application to the Hon. Secretary, Mr. LEWIS CASTLE, Hotham House, Merton, Surrey.

MR. D. T. FISH.—We hear that our well-known and energetic correspondent, Mr. D. T. FISH, is leaving Hardwicke, the gardens of which he has directed so ably for years, and means to devote his time to the duties of judging at large shows, landscape gardening, and literature, and we and all our readers will heartily wish him abundant success in his new career.

A FLOWER SHOW AT BETHNAL GREEN.—Of all places in which to look for a flower show, Bethnal Green would appear to be one of the most unlikely, and yet a Society known as the East London Amateur Floricultural and Chrysanthemum Society has just been established there, for the purpose of creating a love for and extending the cultivation of flowers in East London. Many agencies are now being set on foot to raise the level of the social life in the East of London, and one of them is the Society just alluded to. Bethnal Green is a great district for cabinet making, and a considerable majority of the members of the Society are engaged in this work; but it is only those who are strictly amateurs who are permitted to compete for prizes. The radius covered by the Society's operations, is about four miles from Bethnal Green Museum in each direction, but of the many plants staged for competition at the first exhibition held on the 24th inst., all came from within a half-mile radius of the Museum; the farthest point west was Brick Lane, and eastward was Globe Road. There are 110 members, and each subscribes half-a-crown annually. The officers and committee are all working-men, managing their own affairs in their own way, and it must be admitted, with considerable promise of success. Many of these working-men have small greenhouses in their back gardens, in which they grow the plants they exhibit. Some of them are very homely structures, with means of artificial heating set up in a rough-and-ready fashion, but suited to the purpose intended. It is during their leisure hours from labour—generally after the day's labour is over, that time is found in which to give attention to the plants. One member in-

formed us that he worked fourteen hours per day, and found refreshment from labour in attending to the few subjects he grows. It is during winter, when the days are short, light wretched, and fogs abounding, that the pressure of difficulties in cultivation are most severely felt, and when the utmost the cultivator can do is necessary to maintain his plants alive. Plants are also grown in windows to a much larger extent than is imagined by any one walking along the main thoroughfares of Bethnal Green. The most striking window-plant shown was a huge Fuchsia trained to a homely trellis in the shape of a tennis hat, just as much as any one could comfortably lift; it was feathered with foliage to the very bottom, and considering the circumstances under which it is grown, well bloomed. In all probability this plant was at least four or five years old. The Fuchsia is the favourite plant of the Eastender; next comes the zonal Pelargonium, and the Paris Marguerite, Chrysanthemum frutescens, but probably being out of bloom, not a specimen put in an appearance. Cannas, in the form of fine plants; Coleus, a few well-flowered examples of *Plumbago capensis*, *Begonias* of the Rex type—one in particular was very good; Lili-um

competition were sent by Mr. SMITH, gardener to S. GARDINER, Esq., Clapton, which included two most remarkable specimens of Webb's Sensation Tomato in pots, bearing magnificent fruit; and some very fine specimens of *Adiantum cuneatum*; a good collection of ornamental-foliaged plants from Mr. WYATT, the gardener at the French Hospital in Victoria Park; and a large and tasteful group from the President, Mr. J. ANDREWS, florist, Cambridge Heath.

PARK SUPERINTENDENTS.—In consequence of the death of Mr. COCHRANE, Mr. MELVILLE has been appointed to the care of Finsbury Park, which, under Mr. COCHRANE'S management, had become well known for good gardening and for the growth of *Chrysanthemums*. Mr. MOORMAN, of Brockley Park, has been appointed in place of Mr. MELVILLE, an account of whose work at Dulwich was given in a recent number. Superintendents are now required for Brockley Park, Lewisham, and for Waterlow Park, Highbury. A small salary and a residence are offered in both cases. Application should be made to the Clerk of the County Council, Spring Gardens, W., before September 13.

fully open, were about twice the size of the largest Nerine bloom, and of a faint lilac-pink shade, with a bluish flush down the centre of each petal; but to describe the flower as blue, as I was informed it was, required a considerable exercise of the imagination. As I had heard from my friend Mr. Baker that A. Halli was only a garden name, and not the correct botanical name of the plant, I sent him one of the flowers for identification, and now hear from him that he has identified it under the second name above given. I consider it to be a plant of merely botanical interest, and of very little merit from a horticultural point of view. *W. E. Gumbleton.*

AN EXTRAORDINARY CROP OF PEACHES.—The largest crop of Peaches which it has ever been my fortune to see, I met with the other day at Whitehall, Hawthornden, Midlothian, the residence of R. G. Warner Ramsay, Esq. The trees were standards growing in a lofty and otherwise roomy span-roofed house. One tree of Bellegarde had a spread of about 16x12 feet, height about 15 feet. It is impossible to say precisely how many fruits this tree bore at the time of my visit, but there could hardly be less than from sixty to seventy dozen. The probability is there were considerably more; the branches were so over-weighted by the crop, that they had to be slung up and supported by wire hooks. A Stirling Castle, of rather smaller size, bore an almost equal weight of crop to that of the Bellegarde. The individual fruit was very fine and large. Many exceeded six ounces in weight, and few were much less than that respectable weight. The colour was superb, and the flavour and texture faultless. Royal George, and others in the same house, also standards, though inferior to the two trees named in point of crop and the size of the fruit, were yet bearing splendid crops. In other compartments of the same range of houses were other Peach trees, trained in the usual way, to trellises, all bearing splendid crops of grand fruit. The exceptional healthiness of the trees was very notable. There was no extreme luxuriance of annual growth; the great crops, which are a yearly occurrence, prevent that, but the compact short-jointed shoots, and the clean shining bark of stems and older limbs, without a vestige of gumming or gnarl of any kind, betokened the most perfect health. The excellent management of Mr. Leyden, who has had charge of the gardens for over twenty years, along with the advantage of a very superior soil, can alone account for such splendid results year after year. *W. S.*

THE POTATO CROP.—In spite of 7° of frost which was experienced on May 17, when the haulm, which was 6 inches high, was cut down to the surface, and nearly a fortnight elapsed before there was the slightest attempt at a secondary growth, the Potato crop is an abundant one—in fact, I never saw the yield better amongst mid-season varieties; but, unfortunately, slight signs of disease are apparent in the tubers. There are so many really first-class cooking varieties, and which at the same time possess excellent flavour, that the wonder to me is, that any other sort is grown. Some people appear to be satisfied, providing the tubers cook well; they never seem to notice the flavour at all. In addition to Sutton's Seedling, Lady Truscott, and Reading Russett, which can always be depended upon for their good qualities, I grew this year Sutton's Fifty-fold; I must say, that for good cropping and cooking qualities, I have not seen its equal as a mid-season variety. It has but a shallow eye, the flesh quite white, and the tubers of good size. I think people generally are now alive to the ill-advised opinion of some in the matter of growing so many kinds of Potatoes. It is more generally found that about six sorts is enough for the largest establishment, where nothing is needed beyond meeting the home consumption. *E. Molyneux.*

THE VARIEGATED ENGLISH ELM.—One of the arboreal features of Ealing at the present time is a variegated English Elm, standing in the private garden of Mr. William Clark, at Ashton House, on the north side of the Green. The tree stands in one corner of the grounds, close to the Green, and some of the branches hang over it. It is a lofty specimen probably nearly a century old; and every portion of it, from the suckers, which are thrown up from the roots, to the top of this splendid tree, have the leaves broadly margined or thickly blotched with white. It is acknowledged to be one of the finest examples of variegation in our common English Elm known; while it is strikingly picturesque and handsome. As to the history of the tree, I can get no information; but, I am told

THE LATE MR. JOSEPH FYE MESTON.

anatum, Petunias, succulents, the Onion Plant of the Londoners, Gloxinias, Castor-oil and India-rubber plants, Musk, *Cyperus alternifolius*, and others, were present, but the Fuchsias largely preponderated, and, on the whole, they were well grown and flowered. There were classes for collections of foliage as well as flowering plants, and groups of miscellaneous plants. There were enough to fill the Oxford Hall, a building connected with the Oxford Mission at the East of London, which was placed at the disposal of the Flower Show Committee, free of charge; and a little hunting and hanging-baskets made the interior quite cheerful, though the light was bad for showing off the flowers to the best advantage. Cut flowers were represented by Dahlias grown at Clapton, also by Asters, Pansies, &c. The best plant selected from the show was one of *Ficus elastica*, shown by W. RICHARDS, a cabinet-maker, so healthy, clean, and well-feathered with leaves to the base of the pot that it would have done credit to any conservatory. Collections of plants not for

HOME CORRESPONDENCE.

AMARYLLIS HALLI OR LYCORIS SQUAMIGERA.—In the month of November, 1887 (as I am informed by my label), I purchased at a comparatively high price, from a leading firm in Haarlem, what purported to be a full size flowering bulb of the above-named plant, which was sent under the first of the two names above cited. I was given to understand that the plant was a hardy *Amaryllis* from North China, with blue flowers. During the three intervening summers my bulb, much to my disappointment, only produced each year from eight to ten strap-like leaves, and no following bloom spike in the autumn, as I, each year, expected it to do, so that I almost began to despair of ever seeing what its supposed flower was like. About the middle of July of this year, however, it produced a fine healthy flower-spike, which quickly grew to the height of 2 feet, and exactly resembled in appearance that of a strong-growing Nerine. There were five flowers on the spike, which, when

by old inhabitants, that many years ago, when Ealing was the village Thack-ray knew as a school-boy, and before modern Ealing was commenced, a brook ran along by the side of this Elm, and there is reason to believe it is an accidental seedling. The most remarkable feature about it is, that until I called attention to the existence of this tree in our local paper, last year, no one appeared to have noticed its existence. By the side of the tree is the Ealing Liberal Club, and anyone standing upon the balcony to the first floor windows can see this beautiful Elm to the best advantage. It is, in all probability one of the finest pictorial trees in the county of Middlesex. *R. Dean.*

CRINUM MOOREI ALBUM—I read with pleasure that the bulb of a Crinum which was given me in Madeira four years ago under the name of *C. giganteum* has bloomed in the cold frame at Kew, and is now rightly named *C. Moorei album* or Schmidtii. This bulb, which I gave to Kew last year, is a most interesting example of the power of adaptation to circumstances that some organisations possess. In Madeira this bulb rests during the heat and drought of the summer in Funchal, and grows and flowers during the winter and spring—conditions not much unlike our summer. For the first two years that I grew it, it started into growth in autumn, and consequently required heat to keep it vigorous at such a season, and it did not flower. The third year it started into growth in January, and flowered in June, and went to rest in August, when I sent it to Kew, where it must have been in a dormant state till late this spring. The fact of its blooming in May and June, and in Madeira in March or earlier, coupled with the belief that this Crinum came to Madeira from the Gold Coast, made me hesitate to believe it could possibly be a form of *C. Moorei*, in spite of the exact resemblance in growth and shape of flower—hence one good reason for sending it to the authorities at Kew. A grand clump of this fine Crinum in a Madeira garden, with thirty spikes of its snow-white blossoms on long stalks above the bright green foliage, was so beautiful a sight that I asked for a bulb, never dreaming it could be possible for such a magnificent Lily to be hardy, or nearly so, in England, and I am consequently equally surprised and pleased to know it is a white form of the hardy Crinum Moorei, which will grow and flower wherever the *Amaryllis Belladonna* thrives. *Edward H. Woodall, Scarborough.*

FERNS AT COLWYN BAY.—The following list of Ferns, which survived last winter, may be useful to cultivators of hardy Ferns. The most injurious frost that we had was 17° without snow. The *Todeas* are planted in peat by the side of a small stream, and overhung by a Portugal Laurel bush, and they had a few branches of Laurel stuck in the ground amongst them. *Hypolepis millefolium*—sometimes erroneously sold as *Hypolepis anhriscifolia*—is an exceedingly pretty species, which is running all over the fernery, threatening to become a nuisance. I have not included British species:—

<i>Onclea sensibilis</i>	<i>Polystichum acrostichoides</i>
" (<i>Struthiopteris</i>) <i>germanica</i>	" <i>manitum</i>
<i>Dennstaedtia davallioides</i>	" <i>fulvum</i>
<i>Microllepia strigosa</i>	" <i>lepidocaulon</i>
<i>Cystopteris bulbifera</i>	" <i>vestitum</i>
<i>Hypolepis millefolium</i>	" <i>setosum</i>
<i>Lomaria nuda</i> (?)	<i>Lactaria atrata</i>
" <i>fluviatilis</i>	" <i>acuminata</i>
" <i>protera</i>	" <i>decomposita</i>
" var. <i>Chilensis</i>	<i>Osmunda cinnamomea</i>
<i>Woodwardia radicans</i>	" <i>Claytoniana</i>
<i>Asplenium angustifolium</i>	" <i>gracilis</i>
<i>Polystichum concavum</i> (= <i>Lastrea Standishii</i>)	<i>Todea superba</i>
	" <i>pellucida</i>

A. D. Walker, Nant-y-Glyn, Colwyn Bay.

SUMMER PRUNING CURRANT BUSHES.—If it were necessary, another season has fully proved to me the advantage gained by the summer pruning or pinching of the shoots of the Currant in assisting the ripening of the fruit. Red Currants especially receive attention in this respect: the branches are limited to about ten to each tree; each of these are from 4 to 5 feet long, so it can easily be imagined there is plenty of space between the branches. The bushes grow freely, and bear heavy crops of fruit the whole length of the branches every year without fail. Much of this I attribute to the thorough maturation of the wood and buds, which is attained through the action of the sun on the branches. About the second week in June we commence to cut off all shoots to within about three eyes from the base, which enables the energy of the tree to be concentrated in the swelling of the fruit. There is another excellent reason for

the summer-pruning of Currant bushes—the fruit is much cleaner by being thoroughly washed by the rains, which improves the berries considerably in appearance. *E. M.*

A WHITE FLOWERED CENTAUREA NIGRA.—I send you some flowers of the white *Centaurea nigra*. The original plant was found in the midst of the common Hardhead in a field near here. In the borders here this white variety flowers until winter. Has it been noticed before? *William Foster, Stroud, Gloucester-hire.*

THE WAR OF THE ROSES.—Mr. Leadman, in his account of Yorkshire battles, *Prælia Eboracensia*, after describing the terrible conduct at Towton on Palm Sunday, 1461, says, "I cannot conclude the story of Towton without allusion to the little dwarf bushes peculiar to the field of the White Roses and the Red. They are said to have been plentiful at the commencement of the century, but visitors have taken them away in such numbers that they have now become rare. The plants are said to be unique, and unable to exist in any other soil. The little Roses are white with a red spot on the centre of each petal; as they grow old, the under surface of the petal becomes a dull red colour." This is most likely a very dwarf or stunted variety of *Rosa canina*, or the Dog Rose, which is indigenous to Britain; but it may be doubted as to this particular variety being confined to the field of the white Rose and the red. It might, however, be interesting to many could farther information respecting these Rose bushes be obtained, and this may possibly be furnished by some of the numerous readers of the *Gardeners' Chronicle* who may reside near to, or who may have recently visited this celebrated battle-field. *P. G.*

PEACH AMSDEN JUNE.—This Peach, an introduction from America, is making a great reputation in the West of England as an early variety, coming in several days before Hale's Early, also an American variety. Fruit growers in the Bath district, like Mr. S. J. Pavitt and Mr. George Cooling, speak in the highest terms of it, both as to its earliness and quality. Mr. Pavitt stated that this season he gathered fine fruit from a tree on a west wall the first week in July, and that notwithstanding the late cold season. He thinks that, given the usual warm early summer weather at the end of May and in June, it would be possible to gather thoroughly ripe fruit by the third and fourth weeks in the latter month. It has a fine sweet flavour, comes large and handsome; the tree is a free grower, and it bears freely. The Bath Peach-growers praise it highly, and predict for it a great popularity. *R. D.*

LILIUM AURATUM.—I saw, last week, two bulbs of this Lily, both planted this season, and each having two stems; and one bulb had forty-five, and the other eighty-four blooms. *H. G. Brulford, Clapton.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 25.—The attendance of Fellows of the Society and the general public at the Drill Hall, James Street, Westminster, could only by courtesy be called a good one, although the exhibits were such as generally appeal to the popular fancy. Dahlias and Gladioli formed the chief features, and together they made a brilliant display.

The Rev. H. Honeywood D'Ombraïn gave a concise lecture upon "Gladioli." It was of a practical nature, dealing with preparation of soil, planting of bulbs, and staking of flowers. He recommended the bulbs to be deprived of their outer-coats before planting, and then to be divided into two, leaving an eye to each half. All the flowers which Mr. Flower exhibited were from cut bulbs, as also were those shown by the lecturer last year at the Crystal Palace. In his opinion, the varieties of French and English origin were equally good. A discussion followed upon the cause of the disease; much difference of opinion existed, and no remedy was suggested.

Orchid Committee.

Present: Mr. James Douglas, in the chair; James O'Brien, Secretary; and Messrs. E. Hill, H. Ballantine, H. M. Pollett, and Dr. Maxwell T. Masters.

Thomas Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), exhibited *Laelia elegans Bleheimensis*, a fine form of the *L. e. Tur-*

neri section, but with a broad labellum, the side lobes and the front of which is of a clear rosy-crimson. Mr. Statter also sent cut spikes of three other forms of *L. elegans*, also *Laelia amanda*, *Cypripedium Morganæ* × *Odontoglossum Harryanum*, and *Dendrobium Dearei*, for which a vote of thanks was passed.

Messrs. James Veitch & Sons, Royal Exotic Nursery, sent their new hybrid, *Laelio-Cattleya Nysa* × (*C. labiata Warscewiczii* (gigas) × *Laelia crispata*). The segments are pale lilac, the front of the labellum dark crimson, and presenting some of the features of *Laelio-Cattleya exoniensis*. The plant being weak, the committee requested to see it again. They also sent a specimen of *Cypripedium Cleola* × (*C. reticulatum* × *Schlimii albiflorum*).

G. Palmer, Esq., Springfield, staged *Cypripedium apiculatum* × *Springfield* var. (*Boxalli barbatum*), which seemed to be rather darker in colour than the original form.

Messrs. F. Sander & Co., St. Albans, exhibited *Laelio-Cattleya hybrida Behrensiana* (*Laelia elegans* × *Cattleya Loddigesii*). The habit of the plant resembles that of *Cattleya superba*; the flowers are large, sepals and petals bluish-white; the front lobe of the lip broad and flat, and of a bright rosy-crimson. Messrs. Sander also showed *Masdevallia Measuriesiana* × (*M. amabilis* × *M. tovarensis*), a small variety with a slender, twin-flowered stipe of white flowers tinged with rose.

R. J. Measures, Esq., Cambridge Lodge, Flodden Road, Camberwell (gr., Mr. H. Simpkins), sent examples of *Cypripedium leucochilum* and *C. tortile*, both provisionally named. The former is supposed to be a natural hybrid between *C. Godefroyæ* and *C. bellatulum*, and the latter a new species from Dutch East Indies; it resembled a small form of *C. philippinense*, but with shorter and more twisted petals. The Committee requested that these be referred to Kew.

Malcolm S. Cooke, Esq., Kingston Hill (gr., Mr. Callimore), sent a cut spike of a fine form of *Cattleya velutina*, and three varieties of *Laelia elegans* Turnerii.

F. Wigan, Esq., Clare Lawn, East Sheen (gr., Mr. W. H. Young), staged *Aerides suavisimum*.

Mr. J. Prewett, Swiss Nursery, Hammersmith, sent a well-grown plant of *Dendrobium Phaleopsis Statterianum*.

Messrs. Charlesworth, Shuttleworth & Co. exhibited *Zygopetalum grandiflorum* (*Datemanilla grandiflora*), a curious and handsome species, with greenish sepals and petals, striped with chocolate, and white fringed lip.

Messrs. Seeger & Tropp, 112, Lordship Lane, East Dulwich, showed a plant of *Sobralia leucoanthera*, segments reflexed, pure waxy-white, and the front of labellum yellow. C. J. Lucas, Esq., Warnham Court, Horsham, sent *Dendrobium undulatum*. Mr. Jas. Douglas, The Gardens, Great Gearys, Hoard, showed a cut spike of *Cypripedium Lowianum* with six flowers.

Floral Committee.

PRESENT:—W. Marshall, Esq., in the chair; and Messrs. H. Herbst, G. Phippen, George Nicholson, H. C. Leach, Charles Turner, W. Goldring, B. Wynne, R. Dean, Henry Cannell, Charles Jeffries, Thomas Baines, Wm. Bam, Charles E. Pearson, William Ingram, Charles Noble, John Fraser, William Hy. Williams, James Walker, and Rev. H. Honeywood D'Ombraïn.

A Silver Banksian Medal was awarded to Messrs. Hugh Low & Co., Clapton, for a collection of Lilies, including a beautiful box of *Lilium ochroleucum* (syn. *Wallichianum superbum*), trumpet-shaped, cream, with golden centre; also *L. nepalense*, yellow, shaded with brown.

Messrs. J. Veitch & Son, Chelsea, exhibited baskets of *Eucryphia pinnatifolia* and *Colletia spinosa*, both full of white flowers; also *Retinospora squarrosa sulphurea*, a variety with young growths sulphur-colored; *Cupressus arizonica*, with glaucous, loose feathery branches; *C. Lawsoniana versicolor*, white and gold variegation; hybrids of *Rhododendron japonico-jasminiflorum*, a lot of attractive colours, among them being Dante, chrome yellow; Thetis, fawn; and Imogene, cream colour.

C. E. Smith, Esq., Silvermere, Cobham, Surrey (gr., Mr. Quarterman), had a collection of thirty-six varieties of Oak, chiefly seedlings of *rubra*, *coccinea*, *nigra*, and *robur*; for this interesting lot a Bronze Banksian Medal was awarded.

Mr. Anthony Waterer, Knapp Hill, exhibited *Hypericum Moserianum* ×, flowers rich yellow, good substance, anthers crimson.

Messrs. Wallace & Co., Colchester, obtained a Bronze Banksian Medal for a collection of Lilies, consisting of *Lilium eximium* var. *giganteum*, *L. e.* var. *magnificum*, large pure white flowers, segments reflexed, tube 8 inches long; and *L. Takesima*, white tubular flowers, pointed petals.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, had a collection of hardy flowers, including Carnation *La Neige*, pure white fringed flowers, slightly scented (Award of Merit); *Lilium ochroleucum*, and *L. auratum platyphyllum*, like the type, but without spots; and *L. a. rubro vittatum*, with deep crimson band.

Messrs. Dicksons, of Chester, exhibited four new border Carnations, viz., Mr. C. R. Humbert, rich crimson-scarlet (Award of Merit); Miss Greenall, rose-scarlet, well formed; and Mrs. C. R. Humbert and Lady Gerard, both pink flowers.

Mr. Campbell, Lord Street, Southport, had a nice form of *Scolopendrium vulgare* var. *Campbelli*, with corrugated margin.

J. T. Hopwood, Esq., Ketton Hall, Stamford (gr., Mr. W. H. Divers), was awarded a Bronze Banksian Medal for a varied collection of Carnations, of which Ketton Rose, a rose variety with shell-shaped petals, was conspicuous.

Sir Trevor Lawrence, Bart., M.P., Burford Lodge, Dorking, showed *Crinum Powellii*, with umbels of large pink flowers; *Cyrtanthus hybrida rosea*, brilliant umbels of vermilion scarlet.

Rev. W. Wilks brought a hardy Geranium, Shirley Blue, many with white centre.

DAHLIAS formed quite a leading feature, and a large number of blooms were staged. Foremost was a very fine white self show flower, from Mr. John Walker, nurseryman, Thame, pure white, of fine outline, and good centre, named John Walker (Award of Merit). Mr. Arthur Rawlings, florist, Romford, staged a number of new varieties—Arthur Ocock, orange-red, bright, fine shape (Award of Merit); Mrs. McIntosh, in fine character, orange-yellow, with a rosy-erise reverse (Award of Merit); John Rawlings, a soft bright lilac self, very pleasing (Award of Merit); Mrs. Lewis Standbridge, buff-yellow self, very bright, and of fine shape (Award of Merit); George Hurst, crimson-maroon, flushed with purple; Mrs. Hurst, a light variety, in the way of Queen of the Belgians; George Gordon, bright crimson; and Mrs. Ocock, yellow, edged with orange-brown. Mr. S. Mortimer, nurseryman, Farham Sarrey, had a collection of seventy-two very fine show varieties, large handsome flowers, of considerable merit.

Messrs. J. Cheal & Sons, Lowfield Nurseries, had a collection of show, single Cactus, and Pompon varieties. Among the singles were some new-edged flowers of great merit, viz., T. W. Girdlestone, white, with margins of bright purplish-crimson, medium size and excellent shape (Award of Merit); Miss Glasscock, silvery white, with side edgings of soft lilac purple, very pretty and distinct (Award of Merit); Cleopatra, crimson, shaded with maroon, somewhat novel in character; Claudia, in the way of Duchess of Albany, but scarcely so good; and Duchess of Fife, pale orange, with slight shadings of orange-red; and of Cactus and decorative varieties, Lady Masham, Black Prince, very dark; Zulu, Beauty of Arundel, and Duke of Clarence. Messrs. Keynes, Williams & Co., nurserymen, Salisbury, had a collection of sixty blooms of very fine show varieties; some pretty Pompons, including Lillian, a very pretty pink-margined variety; and some surprisingly good new varieties of the true Cactus type, such as St. Catherine, deep yellow, the lower petals tinted with brownish yellow, extra fine, and distinct (Award of Merit); Kynarith, bright deep shaded scarlet, of the best Cactus type, extra fine (Award of Merit); Baron Schroder, bright crimson, shaded with magenta, also very fine (Award of Merit); and the collection also included Honoria, Panthea, Harry Freeman, white, Robert Maher, yellow, &c. From Messrs. Henry Cannell & Son, nurserymen, came a very good collection of Cactus and decorative Dahlias, including Robert Cannell, one of the most distinct of the true Cactus type yet introduced, bright rosy crimson, flushed with magenta, the petals numerous, well arranged, and somewhat grided or curled (Award of Merit); Swanley Cactus, pale orange yellow, extra fine (Award of Merit); Ernest Cannell, soft rosy peach; Beauty of Arundel, crimson and purple; Cannell's Favourite, orange yellow; Panthea, and other attractive varieties. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, had *Delicata*, one of the true Cactus type, soft pink, with slight yellow centre (Award of Merit); F. J. Taylor, orange-crimson, very bright; and two or three new Pompon varieties,

very pretty, but a little large. From Mr. G. Phippen, nurseryman, Reading, came a number of floral shields of Cactus and decorative Dahlias, about twenty in all, and containing from fifteen to twenty flowers each; they made quite an imposing display. In addition, Messrs. J. Cheal & Sons had a number of plants of Mr. Girdlestone's Tom Thumb single Dahlias, which are probably a little too dwarf to find much public favour.

GLADIOLI.—A fine collection of spikes, staged by Messrs. Kelway & Son, of Langport, about 160 in all, including many new varieties, and some very fine forms of the Lemoinei section; *Thalia*, pale sulphur-white, each segment having a large blotch of bright pease-purple, was very fine and distinct (Award of Merit); they also had—the Rev. W. Wilks, a fine light variety, flaked with pale purple; Henry Cannell, light, flaked rosy-crimson; Solon, pale salmon-scarlet; James Payn, bright salmon-scarlet; Chilio, light sulphur and purple, &c. Mr. W. H. Flower, Claremont, Taunton, a well-known West of England amateur, had a collection of twenty-four fine spikes; and the Rev. H. H. D'Ombra, nine fine spikes; while some hybrids of G. Lemoinei came from Mr. G. C. Powell.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. Robert Hogg, George Bunyard, J. Cheal, William Warren, R. D. Blackmore, J. Wright, T. J. Saltmarsh, Alex. Dean, G. Norman, G. Wythes, H. Balderson, W. Bates, F. J. Lane.

A vote of thanks was passed to W. Roupell, Esq., Harvey Lodge, Streatham Hill, S.W., for four dishes of finely-coloured early dessert Apples, viz., Mr. Gladstone, Irish Peach, Devonshire Quarrenden, and Red Astracan.

Messrs. Laxton Bros, Bedford, showed a new Apple, Harvest Queen, from Mr. Gladstone × Early Julien, similar to Mr. Gladstone, but paler and angular, like Early Julien.

Messrs. Thomas Barton & Sons, Bexley Heath, Kent, were awarded a vote of thanks for collection of Peaches packed for market, consisting of Princess of Wales, Barrington, Sea Eagle, and Gladstone.

Seedling Melons came from Miss Sullivan, Broom House, Fulham, gr Mr. Wilson; also from Duke of Northumberland, Ston House, Brentford (gr. Mr. G. Wythes); and from R. Butler, Esq., Westby Hall, Bury St. Edmunds (gr. Mr. Alfred B. Shop).

Messrs. Sutton & Sons, Reading, had samples of a new Bean, Tender and True, a runner, with long slender pods, like the French Bean; this was referred to the Chiswick trials for report.

WILTS HORTICULTURAL.

AUGUST 12.—This Society held its annual exhibition of plants, cut flowers, fruit, and vegetables, in the Bishop's Palace grounds, Salisbury, on the above date, and was one of the best, if not the very best, hitherto held by the Society.

Plants.—These were well shown. Mr. Finch, gr. to James Marriott, Esq., Coventry, and a new exhibitor at Salisbury, was 1st in the class for twelve stove and greenhouse plants, distinct, six foliage and six flowering, staging grand plants of, among others, *Kentia Fosteriana*, *Cycas circinalis*, *Latania borbonica*, *Ixora Wilhamsii*, of great size, and covered with large trusses of bright scarlet flowers; *Erica jasminiflora alba*, and *E. lilyana*. Four lots were staged.

In the class for nine stove and greenhouse plants, four in bloom and five foliage, Mr. J. Curry, gr. to Col. Pepper, Milford Hill, Salisbury, was 1st, his nine including a well-flowered *Erica Macnabiana*; Mr. W. Peel, gr. to Miss Todd, Shirley, Southampton, was a good 2nd.

Mr. Wilkins was 1st for six exotic Ferns, staging immense plants, in fine condition, of *Gymnogramma lanceana gigantea*, *Adiantum cuneatum*, *Microlepia birta cristata*, *Davallia Mooreana*, *D. Polyantha*, and *Adiantum Farleyense*.

Groups.—These were quite a feature in the show, no less than twenty-one being arranged. In the two most important classes, the arrangements were pretty much in the same light and effective style, plants of various kinds being placed at short intervals in a groundwork of Maidenhair Fern, the whole being fringed by *Panicum variegatum* and *Isiopsis gracilis*; and in some cases the dwarf variegated-leaved *Caladium argyrites* was used by itself with good effect, so that the quality and suitability of the plants composing the respective groups decided the relative positions of the exhibitors. For the Earl of Radnor's prize for a group covering a semi-circle of 12 feet in diameter, Mr. Wilkins was 1st, out of five capital

arrangements; a fine spike of *Ocimum incurvum*, showing to great advantage in the centre of his group, in which were also conspicuous nicely-flowered plants of *Cattleya Gaskelliana*, *Dendrobium formosum*, &c. Mr. Curry was 2nd. Eight good groups were arranged for Messrs. Keynes, Williams & Co.'s prize, the space to be covered being a semi-circle of 10 feet in diameter. This prize was also secured by Mr. Wilkins.

Fruit made good display, and was shown in fine condition. Mr. H. W. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, secured premier honour in the class for a collection of eight kinds, staging good bunches of Muscat of Alexandria and Alnwick seedling Grapes, Queen Pine, Sea Eagle Peaches, Elong Nectarines, Moor Park Apricot, Lockinge Hero Melon, and Brown Turkey Figs—a good all round lot. Mr. Ingfield, gr. to Sir John Kelk, Bart., Tedworth House, Marlborough, was a good 2nd, his Black Hamburgh and Muscat Grapes and Waburton Admirable Peaches being extra fine. Mr. Ward had the best Pine-apple, and Mr. Budd, gr. to F. G. Dalgely, Esq., Lockerly Hall, Romsey, had the 2nd best, both staging bright fruits of the Queen variety. Grapes.—Out of seven good stands of three bunches of Muscat of Alexandria, Mr. Ingfield dealt with handsomely well-coloured bunches, being followed by Mr. Watson, gr. to Ashley Dodd, Esq., Seaton House, Coddford, and Mr. Budd.

In the corresponding class for Black Hamburgs, Mr. Ingfield was to the front again in a like competition, being hardly pressed by Mr. C. Warden, Clarendon Park Gardens, Salisbury, both showing well-arranged bunches of good shape and perfect finish; Mr. Holloway, Down Grange, Basingstoke, being a good 3rd. Mr. Warden was 1st in the another black Grape class, staging medium-sized bunches of Madresfield Court, in fine condition as regards shape and finish.

In the any other white than Muscat class, Mr. Brown, gr. to the Rev. Sir Tabot Baker, Bart., Blandford, had the best stand out of five, being closely followed by Mr. Warden, both staging good bunches of bright-berried Buckland Sweetwater. Mr. Holloway had the best flavoured Melon out of twelve staged in a Lockinge Hero. Messrs. Ingfield and Macarlane showed the best Peaches, staging grand fruits of Waburton Admirable and Barrington; Messrs. Budd and Ward taking 1st and 2nd honours for Nectarines. Mr. F. Smith, gr. to the Lord Bishop, was 1st for three dishes of dessert Apples, with clean even fruits of Beauty of Bath, Irish Peach, and Worcester Pearmain; Mr. Browning staging the best three dishes of culinary Apples—Alexander, Frogmore Prolific, and Lane's Prince Albert, Mr. Smith being a good 2nd. The same exhibitors occupied the same positions for four dishes of Pears.

Vegetables.—Two good collections of twelve kinds were staged by Mr. Ingfield and Mr. Wilkins, who took the prizes in the order in which their names appear.

Medals.—Two medals, offered respectively by Messrs. W. Wood & Son, Wool Green, London, and the proprietors of the *Gardeners' Magazine* for cultural skill, were awarded to Mr. H. W. Ward, for his collection of fruit; and to Mr. Finch, for his grand dozen of foliage and flowering stove and greenhouse plants.

Non-competitive Exhibits.—Messrs. Keynes, Williams & Co., made a fine show of Dahlias, Gladioli, and Roses—two acoes, about 7 feet high, and 18 inches wide, crossing each other, covered with moss in which Roses in great variety were thickly inter-d, being parished with their own foliage; this artistic arrangement of the celebrated Castle Street firm being in the centre of one of the large tents was greatly admired.

The well-known Exeter firm of Messrs. Robert Veitch & Son made a good show with cut flowers of herbaceous plants in great variety, which, being taste fully staged, made quite a telling display, and was much admired; as also were exhibits of a similar description staged by Mr. Latham, of Salisbury; and the stands of cut blooms of tuberous-rooted Begonias of great size and variety, both double and single, most effectively staged by Mr. Davis, of Yeovil, commanded great attention from visitors.

Mr. Warden staged six handsome and well-netted Melons of the Coqueror of Europe type.

TROWBRIDGE HORTICULTURAL.

AUGUST 19.—The forty-second exhibition of this Society showed no falling off in extent, or in the

quality of the exhibits; indeed, in respect of the latter, it was higher in several respects. The fine specimen *Fuchsias* would have been better in another week; as they were grown in the open air, sunshine was required to get them fully into flower. The tents were arranged as usual in the field near the station, and, thanks to a generous donor, it has been vested in the hands of trustees as a site for the show in perpetuity.

Stove and Greenhouse Plants were well shown in nines, sixes, and threes. In the larger class, Mr. G. Tucker, gr. to Major W. P. Clark, Trowbridge, was 1st, with a very good lot, comprising a remarkably fine *Eucharis amazonica*; Mr. H. Matthews, gr. to W. H. Brown, Esq., Trowbridge, was 2nd, with very good plants. Mr. J. Hiscox, gr. to E. B. Rodway, Esq., Trowbridge, was 1st, with six; he also staged a very fine *Eucharis amazonica*; Mr. H. Pocock, gr. to J. P. Haden, Esq., Trowbridge, was 2nd. Mr. G. Pymm, gr. to Mrs. Gouldsmith, Trowbridge, had the best three; Mr. Hiscox taking 2nd place. The best specimen plant was a fine *Erica*, from Mr. J. F. Mould, nurseryman, Pewsey; Mr. Hiscox taking 2nd place with *Stephanotis floribunda*.

Orchids, shown in collections of four, were decidedly good. Mr. H. Matthews was 1st, with three forms of *Phalaenopsis*, viz., *amabilis*, *grandiflora*, and *Schilleriana*, and *Cattleya Gaskelliana delicata*; Mr. G. Pymm was 2nd, with *Cattleyas Gaskelliana*, *Loddigesii*, and *Leopoldi*, and with a nice piece of *Vanda suavis*.

Next in importance came the *Fuchsias*, and the champion grower, Mr. J. Lye, gr. to the Hon. Mrs. Hay, Clyffe Hall, Market Lavington, was placed 1st, with six plants, grown in fine condition; the varieties *Charming*, *Abundance*, *Rival*, and *Doel's Favourite*, dark; *Duchess of Fife*, a new and highly promising double white corolla variety, wonderfully free; and *Mrs. Bright*; five of the foregoing were of Mr. Lye's own raising. Mr. Thos. Edwards, gr. to J. D. Knight, Esq., Trowbridge, was 2nd, he had of dark varieties—*Charming Thomas King*, *Abundance*, and *Elegance*, all raised by Mr. Lye, and *Arabella* and *Marginata*, light. Mr. H. Pocock had the best four, staging *Abundance* and *Charming*, dark; *Mrs. Bright* and *Arabella*, light. Mr. J. Lye came 2nd with *Charming*, *Elegance*, and *Abundance*, dark; and *Wiltshire Beauty*, light. *Charming* is one of the most valuable decorative *Fuchsias* ever raised.

Begonias were another fine feature, and here Mr. C. Richman, gr. to G. L. Palmer, Esq., Trowbridge, was 1st with six single and also with six double varieties, having admirable plants in each case. Mr. G. Tucker was 2nd in both classes.

Other flowering plants included *Heaths*, well shown by Mr. J. F. Mould; *Gloxinias*, very fine indeed for the season of the year, from Mr. C. Richman; *Achimenes*, *Zonal Pelargoniums* (always finely shown at Trowbridge), *Cockscombs*, *Balsams*, *Petunias*, &c.

Foliage plants were shown in collections of nine, by Mr. J. Currey, gr. to Col. Pepper, of Salisbury, and Mr. G. Tucker. There were good *Caladiums* and *Coleus*, some plants of the latter shown by Mr. H. Matthews were grandly grown. Collections of *Ferns* and *Mosses* in groups of fifteen are another leading feature at Trowbridge, where golden and silver *Gymnogrammas* are grown as well as in any other part of the country. The best collection came from Mr. G. Tucker; Mr. H. Pocock coming a good 2nd.

There is always an excellent display of cut flowers. *Roses* were well shown in twenty-four single blooms, and twelve varieties, three trusses of each, in the open division. Dr. Budd was 1st with twenty-four varieties; Mr. W. Narroway, Oxford, was 2nd.

In the class for twelve trebles, Dr. Budd was again 1st, in both cases showing in fine form. Dr. Budd was also 1st with twelve trebles and twelve blooms in the amateurs' division. *Dahlias* are always seen in good character at Trowbridge, and this exhibition may be said to open the *Dahlia* season. Messrs. Keynes, Williams & Co., Salisbury, had the best twenty-four varieties, showing excellent flowers; and Mr. G. Humphries, florist, Chippenham, was 2nd. In the class for twelve varieties, Mr. S. Cooper, Chippenham, was 1st, and Mr. W. Smith, Kingswood Hill, Bristol, 2nd. Mr. G. Humphries had the best twelve fancies; and Messrs. Keynes, Williams & Co., 2nd. The blooms were very much better in the foregoing classes than we could have expected. Mr. Trinkle, gr. to T. Carr, Esq., Esq., Tiverton, had the best twelve bunches of single *Dahlias*—a remarkable good collection, admirably staged, and Messrs. Keynes & Co., the same number of bunches of *Pompon* varieties; Mr. G. Humphries was 2nd.

Messrs. Keynes & Co. had a fine lot of new varieties of the true *Cactus* that will be seen again

later on, and a very pretty new *Pompon* variety named *Lolian*. Bunches of cut flowers in twenty-four varieties: German and French *Asters*, hardy *Annuals*, *Carnations*, and *Picotees*, very good indeed; owing to the lateness of the season, were all very attractive features.

Fruit was shown extensively, and of good quality. The best collection of ten varieties came from Mr. A. Miller, gr. to W. Long, Esq., M.P., Rood Ashton, Trowbridge, who had good *Alicante*, *Lady Down's*, and *Foster's Seedling Grapes*; *Dymond Peach Pine-apple*, and *Stanwick Elruge Nectarines*; *Brown Turkey Figs*; *Beauty of Bath Apple*, &c.; 2nd, Mr. J. Gibson, gr. to Earl Cowley, Chippenham, who had *Madresfield Court* and *Black Hamburg Grapes*, good *Peaches*, &c. Mr. G. Pymm had the best six dishes, staging *Black Hamburg* and *Foster's Seedling Grapes*, very fine *Pineapple Nectarines*, *Royal George Peaches*, *Moor Park Apricot*, and *Countess Melon*; Mr. W. Haskell, Melksham, was 2nd.

The best *Grapes* in the class for two bunches of black were *Alicante* from Mr. W. Murch, of Bath, remarkable for size and finish, they having been taken from a pot Vine; Mr. A. Miller was 2nd. *Buckland Sweetwater* was the best white Grape. Good white *Muscats* were shown, and the black *Muscats* were *Madresfield Court*. The best *Peaches* were *Violet Hatte* and *Barrington*; the best *Nectarines*, *Pitmaston Orange* and *Stanwick Elruge*. The best *Plums*, *Kirk's Greengage* as black, and *Washington*, as white. The best *Cherries*, *Big-gareau* and *Circassian*. The best *desert Apples*, *Gladstone*, *Beauty of Bath*, and *Irish Peach*. The best *culinary*, *Lord Suffield*, *Ecklinville*, and *Lord Derby*. The best *Pear*, *Jargonelle*.

Table decorations of flowers only, also of fruit and flowers, memorial wreaths, bouquets, &c., were in strong force, and good all round. Collections of wild flowers, and bouquets of the same, were admirably staged.

Vegetables were very extensive, and a great feature. A very large number were staged, and it would not be too much to say Trowbridge could challenge any other district of the country for quality.

The *Gardeners' Magazine* Medal for special excellence was awarded to Mr. George Pymm for a dish of superb *Pine-apple Nectarine*.

THE ARBORICULTURAL SOCIETY OF ENGLAND.

The meeting at Hexham on Wednesday, August 19, was a most successful one, thanks in no small measure to the skilled tree-growers of the locality who have taken part in it. There is the president-elect, Mr. J. M. Ridley, of Walwick Hall. The excursion that was organised for the second day had in view the commercial aspects of forestry, whereas that of the preceding day was concerned with ornamental tree-growing.

The woods of Healey, as Mr. Jewitt of that place explained, are a flourishing illustration of successful afforestation. He pointed out that when the late Mr. Ormiston bought Healey there was little or no wood upon it. He, however, caused it to be planted out wherever practicable, and to the extent of about half of the land. Moreover, before he died, he saw the first growth of trees cut down and the land replanted. Of the timber sold the gross receipts amounted to £56,000. "This," as Mr. Jewitt truly observed, "might be reckoned a very large amount to be taken off an estate which had originally cost about £22,000." But the trees grow when the planter sleeps as when he wakes.

The Second Day's Excursion.—The party, after breakfasting at the Royal Hotel, Hexham, at half-past eight o'clock, set out in carriages for the Duke's House, the residence of Mrs. Backhouse, to inspect the woods on that lady's estate. The next move was to the extensive woods at Dipton, belonging to the Duke of Northumberland, after which the party drove to the estate of Mr. W. Warde-Aldane at Healey, and that of Mr. Henry T. Silvertop at Ministeracres. The next place visited was the estate of Mr. J. W. Walton-Wilson at Shotley. While yesterday's visit was very interesting, it was more an inspection of ornamental trees, &c.; but to-day's excursion was to woods and forests that would demonstrate the desirability of planting lands of small agricultural value, one of the objects of the society being to bring about the partial restoration of the woods and forests with which it is believed every "shire" in this country was at one time so well provided.

REPORTS OF THE FOLLOWING SOCIETIES HAVE BEEN RECEIVED.

Royal Horticultural of Aberdeen; Basingstoke, National Carnation and Picotee (Annual Report), North of Scotland Apiarian, Moor Park, Devon and Exeter, Trentham.

TRADE NOTICE.

MESSRS. J. & W. HERD BROTHERS have purchased the well-known nursery and seed business established in 1810 in Penrith by the late Mr. Jos. Tremble. Both brothers commenced their business career in the establishment of Messrs. Little & Ballantyne, Carlisle. Mr. J. Herd has been well known for the past six years in connection with the firm of Dicksons & Co., Edinburgh; and Mr. W. Herd has been equally well known in connection with the firms of Dicksons & Co., Chester, and W. Fell & Co., Hexham, for a number of years past.

ORCHIDS AT SHREWSBURY.—Owing to the great crush in the exhibition tents on the occasion of the show on the 19th and 20th inst., and reported in our last, a fine bank of Orchids staged by Mr. J. Cypher, Cheltenham, escaped the notice of our reporter until it was too late to rectify the omission. They consisted of admirably-grown and flowered plants of *Cattleya crispa*, *C. superba*, *C. Gaskelliana*, *C. Warnerii*, *C. speciosissima*, *C. Mossiae*, *Backhousiana*, *Odontoglossum Harryanum*, *O. Alexandra*, *O. Lindleyana*, *O. Pescatorei*, *Miltonia vexillaria*, *Masdevallia Harryana*, *M. trochilus*, *M. Schlimii*, *M. Veitchii grandiflora*, *M. Reichenbachiana*, *Ocidium cucullatum*, *O. c. giganteum*, *O. macranthum*, *O. incurvum*, *O. pretextum*, *Lælia cinnabarina*, *Cypripedium barbatum*, *C. Lawrenceanum*, *C. Stonei*, *C. Rzepli*, *C. niveum*, *C. Harrisianum*, *C. Curtisii*, *C. longifolium*, *Aerides Robaniana*, *Epidendrum vitellinum*, *E. prismatocarpum*, *Dendrobium filiforme*, *D. Dearii*, *D. formosum*, *D. giganteum*, *D. rhodostoma*, *Anguloa Ruckeri*, *Saccolabium Blumei*, *Vanda cœrulea*, *Calanthe sylvatica*, &c. These plants were tastefully arranged, and were greatly admired.

Obituary.

MR. SAMUEL BRADLEY.—We regret to record the death, on the 17th inst., after a short illness, at Littledale, Hulam, Notts. of Mr. Samuel Bradley. He was the raiser of Sir Joseph Paxton, Dr. Hogg, Amateur, Oscar, and several other good *Strawberries*, and he must be considered to have rendered great services to horticulture by raising such excellent varieties. The deceased was for many years gardener to Count de Pulley, at Elton Manor, Notts. He was a very fine man, physically, standing 6 feet 3 inches, and proportionately made, and had never required a doctor's services until his last illness.

MRS. MILES.—We regret to hear that a sad calamity has befallen Mr. Miles of the Wycombe Abbey Gardens, by the death, in her 48th year, of his wife, Sarah Clare Miles, on the 21st inst. The funeral took place at High Wycombe Cemetery on August 25.

MR. JOSEPH FYFE MESTON.—The death, on the 19th inst., at Brighton, after a long illness, of Mr. Joseph Fyfe Meston in his 65th year is announced. Mr. Meston was well known to many of our readers as a landscape gardener and contractor, and much of the work on the Victoria Embankment was conducted by him in conjunction with Mr. McKenzie. He was associated also with Mr. Marnock and Mr. Nesfield, and took up some of their work. Mr. Meston was an earnest supporter of the "Gardeners' Benevolent."

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for Districts, Temperature (Accumulated, Daily), Rainfall, and Bright Sun. Rows list districts 1 through 12 with corresponding weather data.

The districts indicated by number in the first column are the following:— Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending August 22, is furnished from the Meteorological Office:—

"The weather has continued in a very unsettled condition generally. Rain has fallen almost daily over the greater part of the Kingdom, accompanied at times by thunder and lightning. The rain experienced over our southern and south-eastern counties during the evening and night of the 20th and 21st was very heavy.

"The temperature has not differed much from the mean in Scotland, but in all the English and Irish districts it has been low, the deficit ranging from 1° to 3°. The highest of the maxima were recorded during the earlier part of the period, and varied from 74° in 'England, S.,' and 72° over the Midland and eastern counties, to 68° in 'Ireland, S.' and the 'Channel Islands.' The lowest of the minima, which were registered on rather irregular dates, ranged from 42° in 'Scotland, N.,' to 45° in 'England, N.E. and N.W.,' and to 53° in the 'Channel Islands.'

"The rainfall has been a little less than the mean in 'Scotland, N.,' but more in all other districts; in all the more southern and eastern parts of England the excess has been very large.

"The bright sunshine shows a deficit in almost all districts. The proportion of the possible amount of duration which was actually registered, ranged from 51 per cent. in the 'Channel Islands,' to 38 in 'England, S.,' and to 16 in 'England, N.E.'"

MARKETS.

COVENT GARDEN, August 27.

MARKET very heavy; prices tending downwards. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit prices: Apples, Currants, Gooseberries, Grapes, Kent Filbert, Lemons, Melons, Peaches, Pine-apples, St. Michael, Plums.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flower prices: Asters, French, English, Bouvardia, Carnations, Chrysanthemums, Cloves, Cornflower, Eucharis, Gaillardias, Gardenia, Gladiolus, Heliotrope, Lavender, Lilium, Maiden Hair Fern, Marguerites, Mignonette, Myosotis, Orchids, Cattleya, Orlontoglossum, Pansies, Pelargoniums, Pinks, Poppies, Pyrethrum, Roses, Sweet Peas, Sweet Sultan, Tuberoses.

ORCHID-BLOOM in variety.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing potted plant prices: Aralia Sieboldi, Aspidistra, Asters, Balsams, Bouvardia, Caladiums, Chrysanthemums, Cockscumbs, Cyperus, Dracæna terminalis, Euonymus, Evergreens, Ferns, Ficus elastica, Fuchsia, Foliage plants, Heliotrope, Hydrangea, Ivy Pelargoniums, Liliums, Marguerites, Mignonette, Myrtle, Palms, Pelargoniums, Spiræa.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing vegetable prices: Artichokes, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Lettuces, Mushrooms, Mustard and Cress, Parsley, Shallots, Spinach, Tomatoes, Turnips.

LETTUCES FOR SPRING CONSUMPTION: A Subscriber, Cabbage varieties, Stanstead Park and Hammer-smith Hardy Green; Cos, Black-seeded Bath, Hardy Winter White.

MARGUERITES: T. H. Grow in cold frame or house, protect from frost, same treatment as scarlet Pelargoniums; give as much sunlight as possible. For winter flowering strike cuttings in June, and when well rooted plant out on south border, and place in pots in October.

MARKET-NURSERY: M. L. The business certainly attracts many persons to embark in it. The best parts are those that enjoy an early spring, as the south, and south-west; but the contiguity of large markets, and freedom from injurious gases and had water are the chief points to study in selecting a locality.

MARKET-BUNDLE CELERY: A Subscriber. Twelve to twenty heads, according to the season.

NAMES OF PLANTS: T. H. E. Veronica Teucrium var. prostrata.—Walsham & Son, Cephalaria alpina; not indigenous, and it does not appear in any nurserymen's catalogues.—G. P. D. Specimens rotten and broken when unpacked. It is a white-spored species, and perhaps A. dealbatus, which comes up on Mushroom beds, displacing all others.—W. & S. Cabbage disease. Roota full of mycelium. All the upper portion full of Macrosporium Brassicæ and a Phoma; but these are saprophytic, and would not cause the mischief. We can find no definite fungus. The disease must be studied on the spot. Profuse wet has much to do with it. M. C. C.—E. W. G. Ulmus campestris var. cornubiensis.—J. W. I, Swainsona galegifolia; 2, Galega officinalis alba; 3, Tanacetum vulgare.—D. O. F. Lysimachia vulgaris.—C. G. I, Helianthus rigidus; 2, Pyrethrum uliginosum; 3, Helianthus multiflorus flore-pleno; 4, Symphoricarpos racemosus; 5, Veronica longifolia; 6, Pelargonium.—Subscriber. 1, Agave americana variegata; 2, Hæmnanthus catalensis; 3, Tradescantia zebrina; 4, Davallia canariensis; G. D. I, Davallia (Leucostegia) pulchra; 2, D. dissecta; 3, D. (Leucostegia) affinis; 4, D. Tyermanni; 5, D. Mariesii.—J. W. H. We cannot attempt to name florist varieties of Pinks. Consult a grower.—C. E. H. We cannot name florist flowers. Please send to a grower.—A. H. H. Oxycoccus Batemanianum.—G. P. Asclepias curassavica. Campanula, next week.—Voz. Bignonia ralicans.—D. M. Cannæ glauca.—C. W. D. Cratægus Crus-galli, the Cockspur Thorn.

PHYLLOXERA: Oxfordshire. Yes, certainly; but the border is otherwise in a bad state from want of drainage, judging from the sodden condition of the roots. As you will have to turn everything out and start afresh, the present will give you a good opportunity of making a new border.

PLANTING YOUNG VINES: A Lady Gardener. You will find it rather difficult to get a young Vine to establish itself amongst the older plants. Better not to try it. Replace the old Vine which you wish to destroy by taking up another young stem or two from the adjoining plot; or, if you wish to introduce another variety, do so by grafting or inarching Madresfield Court Black Muscat; if you do not grow it, it is one of the best of Grapes.

WORTLEBERRY: J. C. The plant succeeds only on high dry ground, and where the growth of Heather is very dwarf naturally, or is cut over to keep it so. It might be made to grow and fruit well, if it were planted in a fully exposed position on good-sized mounds of hard gravelly materials, faced with the kind of peat in which it is found to grow best. If this peat could be skimmed off 4 or 5 inches thick, and placed like turves are in making a lawn, filling up the interstices between them with peaty soil, and treading it all over firmly, it would answer the purpose better than loose peat. Seeds should be sown in preference to planting.

COMMUNICATIONS RECEIVED.—The Marquis of L.—F. N. W.—Dr. F. Noll, Bonn.—Pitcher & Manda, New Jersey.—J. A. C.—Rev. H. H. D'O.—A. B. R.—M. Coomins, Brussels.—C. W. D.—M. Krelage, Haarlem.—D. T. F.—T. & M.—A. Gaut.—R. D., Shrewsbury.—E. Daborn.—Protheroe & Morris (no space this week).—P. B.—D. C. P.—H. E.—T. Walters.—J. F.—E. Bonavia.—C. A. M. C.—W. Early.—E. J. Lowe.—W. C.—R. D.—J. Douglas.—T. H.—A. D.—A. H.—H. M. M.—E. M.—S. P.—Wild Rose.—J. Day.—W. Sutherland.—J. H. C.—Anti-Ants.—G. B.—D. O. C.—R. A. R.—Prof. Henriques, Coimbra.—Vicente de St. Legier, Rio Janeiro.—J. N.—H. W.—W. J. G.—O. T.—W. W.—G. B. F.—X.—Potts' Seedling and Grosvenor Apples next week.

PHOTOGRAPHS, DRAWINGS, &c., received with thanks from Rev. Robt. Dayrell.—R. L.—Monograph of Masdevallia.—The Marquis of Lothian.

NOTICES TO CORRESPONDENTS.

BEES AND SWEETMEATS: W. B. The bees being, as you state, ownerless, you have no remedy at law.

Why not keep your wares in glass jars, or in shallow wooden show cases with tightly fitting lids of glass.

BLACK CURRANTS: J. Tait. We are unable to distinguish one variety of Black Currant from another by the fruit simply.

CAMELLIAS, VINES, ROSES IN BORDERS: A. N. P. It would be optional on the part of the new tenant or the landlord to pay any sum for these.

CARBOLIC ACID TO VINES: Carbohc. In answer to the further enquiries of "A. W.," Vines are frequently attacked by species of Weevil, especially Curculio unicum, and Otiorhynchus sulcatus; the latter being known as the black Vine weevil. These insects are exceedingly hurtful by feeding on the shoots, leaves, and buds, sometimes also on the fruit and flower-buds; and in the larval state they are injurious by feeding on the roots. To prevent the insects from ascending, the plan is sometimes adopted of wrapping cloths saturated with carbohc acid around the Vine stems, but this plan unless very carefully carried out, is apt to kill the Vines as well as the insects, and, therefore, the better system is to dilute the carbohc acid with lime as previously directed (see p. 202). Some growers regard the dust of the prepared lime as more effective than the carbohc acid in driving away the weevils. J. J. Willis, Harpenden.

CLEMATIS FLOWERS: J. & Co. Quite admissible as the wording stands, but not meant, we should think, by the framers of the schedule. Hardy herbaceous perennials were doubtless intended.

GLOXINIAS DISEASED: W. M. These leaves are affected with a very common disease, the exact nature of which is not yet known. In the leaves in question, there is plenty of spawn in the leaves, but no spores; there are also traces of insects. In the absence of fruit, no guess can be made as to the relationship of the fungus. M. C. C.

HOLLYHOCK FOXGLOWS: A. B. S. W. Yes; it is common on most Malvaceous plants.

THE STOTT

SPECIALTIES for DESTRUCTION OF INSECT PESTS.

PATENT DISTRIBUTOR.

Letter received from **The Earl of Lisburne,**
S. Wales, June 29, 1890.
Sir,—Am very well pleased with the Distributor; it does its work well, and is a most useful invention.—Yours faithfully,
LISBURNE.

PATENT SPRAYER.

Extract from letter from **Mr. G. Norman, Gardener to the Right Hon. The MARQUIS OF SALISBURY,**
The Gardens, Hatfield House, Herts, April 20, 1891.
Sir,—I am pleased to report that I consider your Distributor a very useful invention.

PATENT SPRINGE.

Extract from letter from **R. White, Esq., Arddaroch, Gireloch Head, Dumbarshire,**
July 20, 1891.
I consider the Springe bought from you one of the cheapest and best I ever had. It is especially good for spraying Odontoglossums.

KILLMRIGHT.

Extract from letter from **Mr. J. Young, Head Gardener to the Zoological Society, Regent's Park, London,**
July 22, 1891.
It is the best Insecticide I have ever used, and the cheapest.

FEEDMRIGHT.

Extract from letter from **Mr. T. Wise, Gardener to F. TAYLOR, Esq., Ash Lawn, Heatm, Bolton,**
September 20, 1890.
Your Patent Manure has given us every satisfaction.

Apply direct to the Proprietor for Samples and Price free on Rail or Canal. All Orders executed with the utmost promptness and under personal supervision. Special Railway Rates in force for all parts. All kinds of PEAT supplied at lowest possible prices. Sample Bag sent on application to
GEO. GARSDIE, Jun., F.R.H.S., Leighton Buzzard, Beds.

THE "PERFECT" WEED KILLER

Unrivalled for Destroying Weeds on Garden Walks, Carriage Drives, Stable Yards, etc.

Recommended by the entire Horticultural Press. Supplied to Her Majesty's Commissioners of Works, and used regularly at Kew Gardens, etc.

Price—Gallon 2/; 5 gal. 1/0, 10 gal. 1/6, 40 gal. 1/4 per gal. Carriage paid on 10 gallons and upwards.

Used in the proportion of 1 gallon to 25 gallons of Water.

SOLE MANUFACTURERS: THE HORTICULTURAL & AGRICULTURAL CHEMICAL CO.
Works: 97 MILTON ST., GLASGOW.

CAUTION.—Please carefully note our name, address, and trade mark, and do not be deceived by imitations and apparently lower prices of inferior articles. Our manufactures cannot be obtained genuine at Tunbridge, Kent, except from our Agents, Messrs. WIMMER & WARDLEY, Chemists there.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.
15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear Sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.
Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."
Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburg.**

May be had from **R. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London;** and from **WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London**

FOR DESTROYING WEEDS, MOSS, &c., ON CARRIAGE DRIVES, GARDEN WALKS, ROADS, STABLE-YARDS, WALLS, STONEWORK, &c.

Saves more than twice its cost in Labour. No Smell. One application will keep the Walks and Drives clear of Weeds for at least Eighteen Months.

Mr. W. G. HEAD, Crystal Palace, says:—"We are so satisfied with your composition and its price that we have used it absolutely. I have every confidence in recommending it."

Mr. R. IRWIN LYNCH, Curator, Botanic Gardens, Cambridge, says:—"There can be no question with regard to its efficacy."

Prices:—In 1 and 2-gallon Tins, 2s. per gal. (Tins included); in 5-gallon Drums, 1s. 6d. per gallon. 10 and 15-gallon Drums, 1s. 4d. per gallon. Special quotations for larger quantities. Carriage paid on 10 gals. and upwards.

Used in the proportion of one gallon to twenty-five gallons of water.

For particulars of ANTI-FUNGI POWDER for TOMATO DISEASE, ZINC LABEL INK, GARDEN MANURES, WORM KILLER, &c., write to the Sole Proprietors and Manufacturers,

THE "ACME" CHEMICAL COMPANY,
Tunbridge, Kent;
and Carlton Street, Bolton, Lancashire.

Now Ready.—Volume III.

"WARNER'S SELECT ORCHIDACEOUS PLANTS,"

published by Robert Warner, F.L.S., F.R.H.S., consisting of thirty-nine beautifully-coloured plates, painted by hand, and true to nature; with the most reliable descriptions and notes on culture, forming a handsome volume suitable for the drawing-room. This work is by permission specially dedicated to Her Most Gracious Majesty Queen Victoria, and received First Prizes at several International Botanical Congresses, and a Medal at the Calcutta Exhibition. The First and Second Series, and back Parts, may also be had. Published by the Author, ROBERT WARNER, Widford Lodge, near Chelmsford.

BOILING WATER OR MILK.

E P P S ' S GRATEFUL-COMFORTING.

C O C C O A BREAKFAST OR SUPPER.

Borough of Rotherham.

THE CORPORATION REQUIRE the services of a GARDENER, between 30 and 40 years of age, to take charge of Clifton Park. Wages, 50s. per week, with house rent free. One with a knowledge of Forestry and Landscape Gardening will be preferred. Written applications, endorsed "Park-keeper," to be sent in to me on or before the 29th inst.

By order, H. H. HICKMOTT, Town Clerk,
Council Hall, Rotherham, August 13, 1891.

WANTED AT ONCE, A TRAVELLER,

Well up in Orchids, Hardy Plants, and General Nursery Stock.

Apply, stating where previously employed, and salary expected, to W. & M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED IMMEDIATELY, a practical GARDENER, to visit and give advice to cottage and allotment-gardeners in various parts of Wiltshire.—Knowledge of Fruit-growing and various branches of allotment-gardening indispensable. Knowledge of Bee management desirable. Salary 30s. per week, and travelling expenses.—Apply, stating qualifications, to Rev. F. R. LAWSON, Clent Vicarage, Stourbridge.

WANTED, HEAD WORKING GARDENER, who thoroughly understands Vines, Glass, Flower and Kitchen Gardens.—Under-gardener kept. Wife as Laundress. Churchman.—Write full particulars, to J. FORREST, Esq., Gryms Dyke, Prin's Risborough, Bucks.

WANTED, a SINGLE-HANDED GARDENER.—One who understands rearing Poultry, and willing to make himself useful preferred.—Letters only, to GARDENER Gregory, 52, Hart Street, Covent Garden, W.C.

WANTED, a MAN and his WIFE, as GARDENER and LAUNDRESS, without family, both thoroughly efficient. A comfortable dwelling, with coals and gas, and good wages.—Apply, by letter, to W. C. ABBOTT, 32, Kestelnap, London, E.C.

WANTED AT ONCE, MAN and WIFE, for an English Gentleman's Place, in a quiet part of Ireland. Man must be a thoroughly active and experienced Out-door Gardener, understanding Flowers, Fruit, and Vegetables. Wife must be a really good Laundress. To live in Gate Lodge. No young children, but employment might be given to a grown-up son or daughter. Good personal character needed.—Address, P. EICKNELL, Esq., 89, Newington Butts, S.E.

WANTED, an UNDER GARDENER, married.—A persevering young Man, to take charge of Houses, with a good knowledge of Gardening in general. Cottage found. Apply, stating experience, to Mr. G. GRIGG, The Gardens, Cuffee Is, Lambeth.

WANTED, for a private place, an ORCHID GROWER, to take charge under the Head Gardener. Must be an experienced, competent man. Wages, 18s. per week and bathy.—Apply, with all particulars, to SANDERS, St. Albans.

WANTED, a FOREMAN, for the Fruit Department, to produce first-class Fruit. Two in bothy.—Apply, giving particulars of experience, copies of testimonials, &c.—W. BOWMAN, Hylands Park, Chelmsford.

WANTED, a WORKING FOREMAN, where Palms are grown extensively for Market. Must have had experience in Market Nurseries, and be willing and energetic. Permanent situation offered to a good Man.—JOHN ROCHFORD, Page Green Nurseries, South Tottenham.

WANTED, a good GENERAL FOREMAN, married. Wages, 21s. per week, with Lodge (Wife to attend Gate), Coal, and Milk. Chiefly for Glass. Must be a good Decorator, and produce good testimonials.—B., 7, High Street, Tring.

WANTED, IMMEDIATELY, in a Suburban Nursery, an active WORKING FOREMAN, with a thorough knowledge of Growing Plants and Cut Flowers for Market. Highest references as to character and ability required. Married, no family, preferred. House and firing free. State wages, &c., to H. Mr. Barter, High Street, Miteham, Surrey.

WANTED, a thoroughly good MAN, for Inside and Out.—Married, no children. Wages, 20s. per week, and a cottage.—J. WADE, 74, The Chase, Nottingham.

Improver in Bulb and Seed Department.

W. M. PAUL AND SON have an OPENING for a young MAN as above. Must be able to write fairly. Apply by letter only in the first instance.—PAUL'S NURSERIES, Waltham Cross, Herts.

WANTED, IMPROVER in Greenhouse Department.—Must be a good hand at Firing.—Apply W. M. BARRON AND SON, Elvaston Nurseries, Borrowash, Derby.

WANTED, a single MAN, to look after Hot-air Engine, and when not so employed to fill up his time in Garden. Not under 25. Bothy, and 15s. a week.—GARDENER, Fresham Place, Farnham Surrey.

WANTED, a strong single MAN, as GARDEN LABOURER, to work Lawn Mower, horse-power; also use Scythe, and take leading part in work of a large garden. Good wages to a deserving man. Apply to HURST AND SON, Burbage Nurseries, Huncley.

WANTED, a practical BOOK-KEEPER (young man), with good knowledge of Seed Trade; to assist at Counter when required.—Apply, stating wages and all particulars of testimonials, to H. B. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.WANTED, a JUNIOR ASSISTANT, for Seed, Bulb, and Floral Business.—State wages required and full particulars to N. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first-rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

GARDENER (HEAD), and ORCHID GROWER.—Age 31; seventeen years' experience in Orchids, Stove and Greenhouse Plants, early and late Forcing, hardy Fruit, Flower, and Kitchen Gardens.—WILLIAM LAKER, Quorn Lodge, Loughborough, Leicestershire.

GARDENER (HEAD).—Age 35, married; understands Vines, Stove and Greenhouse Plants, Flower and Kitchen gardening; three and a half years in present situation.—A. B., Hillingdon Heath, Uxbridge.

GARDENER (HEAD), where two or three are kept.—Age 30, single. Sixteen years' experience in all branches of gardening. Two years in last situation.—G. BAKER, 4, Queens Terrace, Gomer Road, Teddington, Middx.

GARDENER (HEAD), in a good establishment; fifteen years' practical experience.—J. C. McPHERSON, Gardener to the Right Hon. the Earl of Londesborough, can with confidence recommend his Foreman, G. Gurney, who has been with him four years, to any Nobleman, Lady, or Gentleman, requiring the services of a good all-round man.—Londesborough Park, Market Weighton, Yorkshire.

GARDENER (HEAD); married.—Twenty-four years' practical experience in all branches of Gardening, both inside and out. Good references.—A. B., Mr. Barnes, Mapleton, Ashbourne.

GARDENER (HEAD), where three or more are kept; fifteen years' experience in all branches of Gardening. One year and nine months' good character. Six years previous with Mr. Culverwell, Thorpe Ferraw, Bedale. — S. SEDGWICK, Leyburn, Bedale.

GARDENER (HEAD WORKING), where two or three are kept. — Age 27, single; twelve years' sound, practical experience in all branches of the profession. — C. S., Mr. Mills, Avenue Road, St. Neot's, Hants.

GARDENER (HEAD WORKING). — Age 50; thoroughly practical in all branches, and character will bear strict investigation. — A. B., 59, Faulkner Street, Bishopfields, Chester.

GARDENER (HEAD WORKING). — Mr. HERSEY, Gardener to the Rt. Hon. Sir H. Selwin-Ibbetson, Bart., M.P., Down Hall, Harlow, Essex, highly recommends his present Foreman (who has been with him 23 years), to any Lady or Gentleman requiring a good practical Gardener. Has eight years' previous references from other large places, and is well versed in all branches of the profession, especially Fruit and Plant Growing; also Housework. Has had charge of young men, and desires a situation where not less than three or four are kept. Is well recommended by the above gentleman. Abstainer.

GARDENER (HEAD WORKING), or FOREMAN, in a large establishment. — Age 39. Thoroughly experienced in all branches. Good references. — HARDING, 17, Hall Place, Paddington, W.

GARDENER (HEAD WORKING), where one or more are kept, or good SINGLE-HANDED. Understands the management of Vines, Melons, Stove, Flower, and Kitchen Garden. Age 36, married, no family. Seven years' good character. — E. CROCKFORD, Holme Chase, Bletchley, Bucks.

GARDENER (HEAD WORKING), or good SINGLE-HANDED. — Age 27. Good references from large establishments. — W. ALLSOP, The Gardens, Rufford Abbey, Orleton Notts.

GARDENER (HEAD WORKING). — Age 32, no family; life experience in all branches. Excellent character. — E. W. JENKINSON, Head Gardener, Kirby Frith Hall, Leicester.

GARDENER (HEAD WORKING). — Age 39, married; a thoroughly good, practical, and competent Gardener. Twenty-three years' experience in Growing Grapes, Peaches, Figs, Melons, Cucumbers, Mushrooms, Tomatoes, Stove and Greenhouse Plants, Orchids, Flower and Kitchen Gardening, Early and Late Forcing. Abstainer. Highest references. — GARDNER, Oakwood, Chichester Sussex.

GARDENER (HEAD WORKING), or good SINGLE-HANDED. — Age 27; twelve years' practical experience in all branches. Excellent testimonials. — J. BROOKES, The Gardens, Nuttall Temple, Nottingham.

GARDENER (HEAD WORKING), where two or three under ones are kept. — Age 39, married; fourteen and a half years' experience in all branches of Gardening. Good characters from present and previous employers. — BODMAN, Nunnery Gardens, Isle of Man.

GARDENER (HEAD WORKING), where three or more are kept. — Age 31; married, two children; fifteen years' thorough practical experience in all branches; seven years with present employer. Character, with testimonials, will bear strict investigation. Leaving through establishment being broken up. — W. DOUST, Lamberhurst, Sussex.

GARDENER (HEAD WORKING). — Age 28, married. — Mr. OFFER, Handross Park, Crawley, can with confidence recommend his Foreman to any Lady or Gentleman requiring a good practical all-round man as above. He has been with him four years.

GARDENER (HEAD WORKING). — Age 40; a good all-round hand. Married, with family. Good character. Twenty years' experience. — T. JONES, Knowle, Bispham, Poulton-le-Fylde, Lancashire.

GARDENER (HEAD WORKING), where one or two others are kept. — Age 27; experienced in all branches. Good character. — A. H., The Gardens, Randall's Park Leatherhead, Surrey.

GARDENER (HEAD WORKING). — Married, where one or two are kept; thirteen years' experience in Vines, Peaches, Melons, Orchids, Stove and Greenhouse Plant, Flower and Kitchen Garden. Good character. — G. Mr. W. Burt Albert Road, Cosham.

GARDENER (HEAD WORKING), or SINGLE-HANDED. — Age 42; married, two children; seventeen years' experience; three years' good character from present situation, seven previous. — GARDENER, Trencham, Emsworth, Hants.

GARDENER (HEAD WORKING). — Age 30; fifteen years' good experience in Fruit and Plants under Glass, Kitchen and Flower Garden. Excellent testimonials and references. — ASHWELL, Bedford Road, Morhanger, Sandy, Bedfordshire.

GARDENER (HEAD WORKING). — Age 36, married; twenty years' experience in all kinds of Fruit, Flowers, and Vegetables. Early and Late Forcing. Wife as Landlady, if required. Good characters, and well recommended. — B. S., Croxby Grove, Rickmansworth.

GARDENER (WORKING); age 40, married, one child (12 months); twenty-five years' practical experience in Vines, Pines, Peaches, and Nectarines, Flower and Kitchen Gardens. Five years' character. Please state wages, &c. — THOMAS JAMES, High Lane, near Stockport.

GARDENER (SINGLE-HANDED, or good SECOND). — Age 24, single; twelve years' experience in general routine of gardening. Four years' good reference from last place. — DAY, Tubney School, Abingdon, Berks.

GARDENER (HEAD, or good SINGLE-HANDED). — Age 40; one child, aged 8. Twenty-five years' experience. Good references. — GARDNER, 6, Conduit Vale, Greenwich, S. E.

GARDENER (good SINGLE-HANDED or SECOND); age 24, married. — A GENTLEMAN leaving the country for town, wishes to recommend his Gardener as above. Two years' good character; four years' previous. — E. L. PENTONHURST, Staines.

GARDENER (SINGLE-HANDED), or otherwise. — Age 39, married, one child; thoroughly experienced in all branches. Good references. — MACK, 2, Homestead Villas, Riverdale Road, Plumstead, S. E.

GARDENER (SINGLE-HANDED). — Age 25; ten years' experience in Flowers, Fruit, and Vg-tables. Good reference. — W. CORNWELL, Hadlow Down, Uckfield, Sussex.

GARDENER. — A Gentleman wishes to recommend a Gardener who lived many years with him as Gardener, or suitable for any position of trust. Wife, Excellent characters. No children. — N. H., 71, Holmesdale Road, Reigate, Surrey.

GARDENER. — I should be pleased to recommend my son, age 17. He has been regularly employed here with me. He is very trustworthy, and has good knowledge of all the usual work in Houses, &c. — F. FREED, The Gardens, East Hundred House, Sevenon, Berks.

GARDENER. — Mr. W. B. Bacon, who is removing, wishes to recommend his Head Gardener, thoroughly competent and trustworthy. Six years' excellent characters. — For particulars, apply to Down House, Lamberhurst, Hawkhurst.

GARDENER (SECOND, or SINGLE-HANDED). — Experienced in all Garden Work. Excellent character. No objection to going abroad. — W. HOBBS, Brynpton House, Yeovil.

GARDENER (SECOND), where three or four are kept. — Age 23, single; eight years' experience inside and out. Good character. — W. BROWN, Colley Cottage, Reigate Heath, Surrey.

GARDENER (UNDER), inside, or inside and out, in good place. — Age 21; well recommended by past and present Head Gardeners. — E. MORRIS, 13, Park Road, Doncaster.

GARDENER (UNDER). — Can be highly recommended by Mr. Latham, Botanical Gardens, Edgbaston. — G. POWELL, 34, Threespires Oak Road, Smethwick.

GARDENER (UNDER). — The HEAD GARDENER, Middleton Hall, Tamworth, will be very pleased to recommend a young man as above to any requiring such; has been in Gardens five years. Good character.

GARDENER (UNDER, or SECOND), in Gentleman's garden. — A young man wishing to improve. Four years' experience. No objection to bothy. — W. MATTHEWS, Hill House, Billingdon, Uxbridge.

GARDENER (UNDER), age 19. — A Lady wishes to recommend the above for Kitchen and Flower Garden. Can drive and milk. — L. LEWIS, Wernolen, Ammanford, South Wales.

MANAGER, or HEAD SHOPMAN. — Advertiser has had twenty years' good experience. Ten years in last situation. First-class references. — M. P., Messrs. Hurst & Son, 132, Houndsditch, E. C.

PROPAGATOR. — Roses, Rhododendrons, Conifers, Clematis, and other Climbing Plants, Bedding and general Nursery Stuff. Twenty years' experience. — A. B., 55, Natal Road, Streatham, S. W.

TO FLORISTS. — Young lady, experienced requires situation. Well up in Wreaths, Bouquets, and Sprays; with a knowledge of Seeds and Book-keeping. — Y. Z., The Nurseries, Bagshot.

HOLLOWAY'S PILLS. — PURE BLOOD. — When the Blood is pure, its circulation calm and equable, and the nerves well strung, we are well. These Pills possess a marvellous power in securing these essentials of health by purifying, regulating and strengthening the fluids and solids. Holloway's Pills can be confidently recommended to all persons suffering from disordered digestion, or worried by nervous fancies, or neuralgic pains. They correct acidity and heartburn, dispel sick headache, quicken the action of the liver, and act as alteratives and gentle aperients. The weak and delicate may take them without fear. Holloway's Pills are eminently serviceable to invalids of irritable constitution, as they raise the action of every organ to its natural standard, and universally exercise a calming and sedative influence.

“ A LADY WANTS NO OTHER COSMETIC
THAN

Pears'
soap

But one caution is absolutely necessary from a hygienic point of view. It is a notorious fact that Pears' Soap is sold at a very small profit (I think not more than about one half-penny per tablet), on the wholesale cost price, consequently, one or other of the many soaps in the market (on the sale of which a profit of threepence or fourpence per tablet may be made), is sometimes either substituted or recommended to the buyer as 'just as good,' 'equally pure,' &c., &c., &c., the real object of the dealer, of course, being simply to obtain the greater profit by the sale of the inferior article which he recommends or attempts to substitute. Patients should, therefore, insist on having Pears' Soap when they ask for it, otherwise they may find that, instead of being served with a Genuine Soap, they have an article of most inferior quality foisted upon them; something worse than worthless, calculated only to set up **HEAT, REDNESS, IRRITATION,** and general unsightliness of the skin."

From "HYGIENE OF THE SKIN," by Mr. J. L. MILTON, Senior Surgeon,
St. John's Hospital for the Skin, London.

PEARS' SOAP makes the Hands white and Fair,
the Complexion bright and clear, and the Skin soft and
smooth as Velvet.

FOR PLANTS.

QUICK. LASTING. ECONOMICAL.

The Gardens, Seacroft Heath, Hawkhurst, Kent, March 11, 1891.
 DEAR SIR,—Having used your "Clay's Invigorator" for some time, I am exceedingly pleased with the results obtained from it. As an Exhibitor I have used it upon most sorts of Vegetables with great advantage; also upon many sorts of Stove and Greenhouse Plants, Melons, Cucumbers, Tomatoes, Pot Strawberries, Chrysanthemums, &c. For Lawns it has a quick and beneficial effect. For Amateurs and those with small gardens, where there is a difficulty in obtaining stable or farmyard manure, your "Invigorator" ought to be of special value, as it is clean in use, easy of application, and reasonable in price.—Yours respectfully, J. GILMOUR, Gardener to the Right Hon. G. J. GOSCHEN, M.P.

Sold by Seedsmen, Florists, and Nurserymen, or direct from the Works, in 6d. and 1s. Packets, and SEALED BAGS:—
 7 lbs. 14 lbs. 28 lbs. 56 lbs. 112 lbs.
 2s. 6d. 4s. 6d. 7s. 6d. 12s. 6d. 20s.

The above Trade Mark is printed on every Packet and Bag, and also impressed on the Lead Seal attached to the mouth of each Bag.

A SAMPLE PACKET will be sent post-free on receipt of ONE SHILLING by the MANUFACTURER—

S. C. CLAY,

Marsh Island, Stratford New Town, London, E.
 NO CONNECTION with ANY OTHER FIRM

TO NURSERYMEN AND AMATEUR GARDENERS.

GRUSTACEAN FERTILISER.

Made from the Waste of the Lobster Tinning Factories in Newfoundland and Nova Scotia.

The most beneficial and the cheapest Fertiliser in the Market for Nursery, Vegetable, and Flower Gardens, and for Conservatories, producing the highest results with the smallest outlay. Ask your Seedsmen for a shilling 1 lb. Tin, with printed directions for use, and see that you get none other.

Boná Fide **BENTLEY'S** Fide
WEED DESTROYER.

Mr. J. HUDSON, Gunnersbury House Gardens, writes:—"I am glad to say that the Weed Destroyer has given us every satisfaction; it proved most effectual, and is a great saving of time and labour."

Mr. A. WARD, Stoke Edith Park Gardens, writes:—"I am pleased to tell you that I am exceedingly gratified with the results of your Weed Destroyer, as it destroys both Weeds and Moss on the walks most effectually, and gives the gravel a bright appearance."

In the following sizes, carriage paid:—
 3 Gallon Drums, 5s. 6d. | 12 Gallon Casks, 19s. 0d.
 6 " " 10s. 0d. | 18 " " 27s. 6d.
 40 Gallon Casks, 50s.

SOLE MANUFACTURER:—

JOSEPH BENTLEY,
 CHEMICAL WORKS,
 BARROW-ON-HUMBER, HULL.

GISHURST COMPOUND used since 1859 for Red Spider, Mildew, Thrips, Greenfly and other blight, 2 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade, Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

THE STOTT
 SPECIALTIES for DESTRUCTION OF INSECT PESTS.

PATENT DISTRIBUTOR.

Letter received from The Earl of Lisburne, S. Wales, June 20, 1890.
 Sir,—Am very well pleased with the Distributor; it does its work well, and is a most useful invention.—Yours faithfully, LISBURN.

PATENT SPRAYER.

Extract from letter from Mr. G. Norman, Gardener to The Right Hon. The MARQUIS OF SALISBURY.
 The Gardens, Hatfield House, Herts, April 20, 1891.
 Sir,—I am pleased to report that I consider your Distributor a very useful invention.

PATENT SYRINGE.

[Extract from letter from R. White, Esq., Arddaroch, Garelloch Head, Dumbarntonshire, July 20, 1891.
 I consider the Syringe bought from you one of the cheapest and best I ever had. It is especially good for spraying Oolontoglossums.

KILLMRIGHT.

Extract from letter from Mr. J. Young, Head Gardener to the Zoological Society, Regent's Park, London, July 22, 1891.
 It is the best Insecticide I have ever used, and the cheapest.

FEEDEMRIGHT.

Extract from Letter from Mr. T. Wise, Gardener to F. TAYLOR, Esq., Ash Lawn, Heaton, Bolton, September 20, 1890.
 Your Patent Manure has given us every satisfaction.

TESTIMONIALS and PRICE LISTS on application.

IRONFOUNDERS, ENGINEERS, BOILER-MAKERS, &c.

TWO GRAND NOVELTIES.

A PURE WHITE BEDDING CLEMATIS, and the FERN which has lately received so many of the highest awards and proofs of admiration.

CLEMATIS SMITH'S SNOW-WHITE JACKMANII.—The flowers are paper-white, about the same size as those of the old purple Jackmanii, but produced in even greater profusion. It is unrivalled for beds, and also for climbing. Ready in August. 7s. 6d. each.

PTERIS TREMULA SMITHIANA.—This is a very valuable and distinct Fern. No Collection should be without it. Illustration and description free. 5s. to 10s. 6d. each.

BULBS.—The best procurable.

STRAWBERRIES.—All leading kinds. Descriptive LISTS free.

Also all the best varieties of **CLEMATIS** ready for planting out.

EXETER STREET, STRAND, LONDON, W.C.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

NOTICE.

In our next Number will be published a Report of the INTERNATIONAL FRUIT and FLOWER SHOW, To be held in the Waverley Market, Edinburgh, Sept. 9, 10, 11, together with numerous Portraits of the Officials of the ROYAL CALEDONIAN HORTICULTURAL SOCIETY, including that of the President.

The Most Noble the MARQUIS of LOTHIAN, K.T.

As a large extra circulation of this number is guaranteed, it will form an excellent medium for advertising. Advertisers should communicate without delay with Mr. J. G. MARTIN, Publisher, 41, Wellington Street, Covent Garden, London, W.C.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 5, 1891.

LONGLEAT.

IN writing of great houses, the use of adjectives should not be too freely indulged in, but in the case of Longleat, I must describe it as a beautiful and magnificent place. The house was commenced in 1568 by Sir John Thynne, the founder of the family, on the site of an ancient priory, near a spot where a mill stood, and the *leat*, or trench, which conveyed water to this mill, gave the place its name. The architecture of the edifice is a mixture of English and Italian, not uncommon in great houses of its period. The four fronts of the massive building are ornamented with pilasters and cornices, and there are turrets and statues, and handsome balustrades on the roof. The three stories of the venerable building lift the roof to a dizzy height, and as the leads afford a capital bird's-eye view of the park and surroundings, I asked permission to ascend, and reached them after a steep climb up.

The park, with its wide expanse of turf, fine timber, and numerous deer, lies around the roof trees in stately beauty. Most of the surrounding country belongs to the owner of Longleat, and the Marquis of Bath might almost say in his own neighbourhood, what Alexander Selkirk said of his island, "My right there is none to dispute." Almost the whole of the sylvan country around this high roof belongs to the Marquis. Due west, however, on a clear day, one can see the distant tower of Ammerdown Park, the residence of Lord Hylton. On the south side of the house a fine avenue of Elms, a mile in length, leads to the village of Horningsham, and here and on the steep slopes which shut in the park in other directions, several groups of deer disport themselves with all the grace of their tribe beneath the trees. Everything that meets the eye is extremely characteristic of a well-kept domain.

From this lofty eyrie one can read the map below. On the west side, close to the house, we look straight down upon a newly-shaven cricket-ground, where a match, more lively than that at Lord's or the Oval, is in progress between the people of the village, the servants of the house and four young clergymen of the neighbourhood. On the north side, we overlook the formal edgings of a Dutch garden, composed of clipped Box, Yew, and Berberis Darwinii, but not then furnished with flowers, which could not have been safely put out at that date, the twenty-third day of the most cold, inclement May ever known. There is besides another garden in another style on the same side of the house, the whole space forming a large square diversified by hedge and shrub, and having the house on one side, with an orangery opposite. An ornamental strip of water, called in past times the Longleat, divides the garden from the park; and on the fourth

side of the square is a handsome block of buildings, including stables, brewery and laundry, whose architecture accords with that of the house. The margin of garden between park and house on its other three sides is a narrow one, so that the deer can approach near the windows.

It is quite a long walk from the roof to the cellar, where the hogsheads of good ale are almost innumerable. Longleat is famed for hospitality. When George III. came here, following in his century the footsteps of Queen Elizabeth and Charles II., 125 visitors slept in the house. Ten years ago, the Prince and Princess of Wales met 600 guests here at a ball, and stayed nearly a week; and at the coming of age of Lord Weymouth, 1100 friends and tenants took luncheon together. The house has a frontage of 220 feet, and the cellars are nearly as long. It is fortunate for their present owners that the builders of sixteenth-century houses usually had sound ideas of size and proportion. The rule with them, that a great house should have large rooms, was strictly observed at Longleat. If this were the proper place, I should have wished to describe the beautiful ceilings, and marble fireplaces from Italy, recently added to several of the rooms, and the baronial hall, decorated with armorial escutcheons, hunting pieces, and stags' horns.

The woods approach the house nearest on the east side, where they clothe the sides of such a hill that few persons would care, at night, to pass on wheels down the carriage road that runs through the wood, and athwart the slope of that steep hill. I came that way from Warminster. Cley Hill, with its barrows and antiquities, its smooth turf carpet on the chalk, and its long view, lay on the right as we entered the park. We were already in the wood, and I soon found that a long and steep descent lay before us. The view from this high ground, whence the panorama of the house and the park below is first seen, is very beautiful. One favoured spot on the ridge is known by the name of Heaven's Gate, and the legend runs, that a distinguished lawyer visiting Longleat, gained for this spot its name in this way. He had paused to admire the prospect, when he was asked what he thought of it, "My lord," he replied, "for a lawyer, I was never so near Heaven before."

One of the greatest early improvers of Longleat was the first lord of the family, Lord Weymouth, who made the gardens just noticed on the north front, and placed statues therein. This was at the end of the last century, and the gardens replaced a meadow which hardly occupied an appropriate site so near the house. The third Viscount Weymouth became the Marquis of Bath, and the sire of fifteen children. The second Marquis followed his lead to the extent of numbering ten in family, and although the present Lord of Longleat has only six, one may hope that these will suffice to perpetuate his name.

Visiting the gardens under the guidance of Mr. Pratt, I may preface a very short account of them by saying that they are what excellent and energetic management, with twenty-seven gardeners, can make them. There are 9 acres of kitchen garden. The vinery, in which Mr. Pratt's achievements are well known to the gardening public, is 298 feet long and 30 feet wide, in three compartments; Muscats in one, and about twenty leading sorts in the others. We took a brief look into some of the other houses, in which were ripe Melons, and long rows of ripe Strawberries, blushing in their petals, and we glanced into another house for Peaches, and another for Figs.

I was much interested in the pleasure grounds,

reaching from near the house to the kitchen garden. Here, and in the woods, were planted the first Weymouth Pines, named from their introducer, Lord Weymouth. I much admired two great silver Firs, growing near Mr. Pratt's house, and about 125 feet high. There are many others nearly as high, with proportionate girth. Probably the most remarkable specimen plants in these pleasure-grounds is a standard *Salisburia adiantifolia*, 50 feet high. A *Pinsapo*, 30 feet high occasioned a pause, and one could not pass a Cedar of Lebanon 100 feet by 13 feet without yielding it the tribute of great admiration. The Huon Pine of Tasmania, *Daerydium Franklinii*, of which a cut appeared in *Gardeners' Chronicle*, has been unfortunately much hurt by the severe winter, in spite of its sheltered position, so that Mr. Veitch, who says in *A Manual of the Conifers*, that it is not unfrequently met with in British collections, correctly describes it as only "moderately hardy." A fine specimen of *Araucaria imbricata*, in the same grounds, as well as the exotic Conifers generally, have escaped injury. I must pass many specimens without mention, but not the very handsome Purple Beech, 80 feet by 11 feet, since it is perfect in its shape; nor the *Sequoia sempervirens*, which Lord Bath planted thirty-eight years since, on his twenty-first birthday, which is now a fine tree 80 feet high.

A heronry should be named in a pond north of the house, and here my catalogue must end, and I must quit the park, returning to Warminster by a road passing through Horningsham, and through several miles of woodlands where pheasants, secure in the protection of many keepers, mustered by the roadside as if to be admired. *H. E.* [An illustration of Longleat, with a full account of the Vineries, etc., was given in our number for December 12, 1885.]

NEW OR NOTEWORTHY PLANT.

NEOBENTHAMIA GRACILIS, *Rolfe, n. gen. et sp.**

THIS singular Orchid (fig. 33) was sent to Kew from Zanzibar by Sir John Kirk in 1881. From the first its peculiar habit attracted attention, being altogether different from any other African Orchid known, and, indeed, from anything else in cultivation. In February, 1890, it flowered for the first time, and proved, as suspected, to be quite a new type. It will not fit into any existing genus, and the only course possible is to propose a new one for its reception. It belongs to the tribe Vandeeæ, as it possesses a distinct stipes and gland to the pollinia, and to the subtribe Cymbidiæ, as the lip is adnate to the base of the column, and without a spur. Apparently it must stand next to the genus *Bromheadia*, which has erect leafy stems, with distichous leaves, and two ovoid pollinia, which are sessile on

* *Neobenthamia*, n. gen.—Sepals, sub-equal, somewhat spreading, the lateral ones slightly connate at base, also slightly adnate to base of lip. Petals similar. Lip, somewhat spreading, entire, somewhat narrowed and fleshy in lower half, adnate to base of column at extreme base, immovable; the disc slightly hairy, but without keels or crest. Column short and stout, angles sub-acute, footless; pollinia 2, somewhat bilobed, attached to two slender curved stipes, which are united at extreme base, where they join the semi-circular scale-like gland.

N. gracilis, n. sp.—A tall, branching, and somewhat straggling plant, at present about 4 feet high, with slender sub-erect or spreading branches. Leaves distichous, numerous, recurving, linear, unequally bidentate, 5 to 7 inches long, 3 to 5 lines broad. Racemes terminal, short, many-flowered. Bracts linear setaceous, 1½ to 2 lines long. Pedicels 9 to 10 lines long. Sepals and petals sub-equal, oblong, 5 lines long by 2 lines broad, white. Lip obovate-oblong, truncate or minutely apiculate, unfurlate on the sides, narrowed below, white, with a yellow middle line, and a row of rosy-purple spots on either side, the disc slightly pubescent. Column white, anther-ovary dull purple, minutely puberulous. Native of East Tropical Africa.

a scale-like gland. In that genus, however, the lip is three-lobed, and the side-lobes embrace the column, which latter organ is membranous, and broadly two-winged, none of which characters are seen in the present genus—besides the well-marked difference in habit and in the stalked pollinia. All the structural details are admirably represented in the annexed figure, which has been prepared by Miss Smith. The sketch showing the habit of the plant is much reduced, as will be apparent when it is stated that the leaves are 6 inches long.

The upper branch on the right shows the short, almost capitate raceme, a portion of which with three flowers and several bracts is represented, natural size, in the left-hand bottom corner. All the other details are enlarged. The plant, which at present is about 4 feet high, is loose and straggling in habit, as if it grew naturally among bushes and availed itself of their support. It branches at intervals, and apparently may grow to a much larger size. The distichous leaves are drooping, about 6 inches long, and the short many-flowered racemes are borne at the ends of the branches. The flowers are white, except that the lip has a yellow mid-line and a row of rosy-purple spots on either side, with the anther-case dull purple. It is a very interesting addition to the somewhat meagre list of Tropical African Orchids. It is named in honour of the late Mr. G. Bentham, the well-known author of numerous classical botanical works, whose revision of the *Genera Plantarum* has well been termed "a masterpiece of research and scientific taxonomy," and is certainly a great advance on anything which preceded it. The genera previously named in his honour have been singularly unfortunate.

The *Benthamia* of A. Richard has proved to be identical with *Hermidium*; and that of Lindley is only a section of *Cornus*, characterised by its drupes being united in a fleshy syncarpium. But as this is generally known in gardens as *Benthamia*, it seems best to add the prefix "neo" (as has been done in several similar cases), in order to prevent confusion. The specific name *gracilis* refers to the slender habit of the plant. *R. A. Rolfe.*

ROSES.

MR. T. W. GIRDLESTONE AT HOME.

I AM not going to imitate that hateful institution of the Victorian era, the Society paper. I cannot really tell which foot my friend puts on the floor first, when he rises in the morning, whether he likes his egg boiled hard or soft, or any of those numerous trivialities concerning his domestic life which seems to find so much favour with those who cater for the curious craving about other people's business, which demands and obtains so much pabulum of this nature, for I think that most people will consider my friend is really at home when he is in his garden, and it is of this garden I propose to give a very imperfect sketch.

It was on a pleasant afternoon in July that I arrived at Sunningdale Station, from whence a walk of about three-quarters of a mile brings one to the charming residence which Mr. Girdlestone's father created, and which he still lives to enjoy. About fifteen years ago Mr. Girdlestone reclaimed the land arround from that barren heath-like character which forms the principal feature of this part of Berkshire, near Ascot and Bagshot, the Bagshot and peat sand, but a favourite region for what are called American plants. We have all seen and admired the wonderful *Rhododendrons*, *Azaleas*, &c., which the Waterers, the late John Standish, and Mr. Noble were and are wont to produce. Conifers also flourish in a region where seedling Firs are for ever showing themselves, where the heath has not been brought under cultivation, and for that very reason one where loam-loving Roses would not be likely to flourish. But love and labour conquer all things; and as Roses had to be grown,

the soil had to be made for them. How well this was done, we know from the success which attended Mr. Girdlestone's exhibits before he took up with the single Dahlia! Oh! what a fall was there, my countrymen! and now a good portion of the ground once occupied by them is given over to common uses.

On the front of the house there was evidence that Roses do thrive here; a fine plant of *Maréchal Niel*, from which 300 blooms had been cut this year, testified to this; nor did it, although it has been many years planted, show any signs of canker. Being specially interested in the single Roses, which Mr. Girdlestone has made a specialty, and in which he is so well up, I was, of course, anxious to see them, and especially the grand plant of single *Polyantha*, of which a photograph appeared some time ago (Nov. 26, 1887). On our way to it, we passed the rockery, which in spring must have been a beautiful sight; but as all cultivators of alpine plants know, July is not a month in which they show to advantage, the Primroses, the Gentians, and allied species are over, and it is in the herbaceous border rather than on the rockery we are to look for points of interest.

saw it, was one sheet of bloom. Truly a sheet! just as white as one, not a green leaf to be seen; and as I stood in admiring wonder before it, I could not help saying, "Well, it was worth all the journey to see this alone," and it is within the reach of everyone who has a garden. It is perfectly hardy, grows very rapidly, and while it lasts, is unsurpassed for chaste loveliness. Then Mr. Girdlestone has been experimenting on it as a stock, and he speaks hopefully of it, especially for Teas. Of this doubtless we shall hear more by-and-by. Most of the single Roses, of which Mr. Girdlestone has an excellent collection, and in which he is an adept, were past, but one *Macrantha*, one of the very finest of them all, was still in flower, this has a large pure white flower, the centre filled up with light yellow stamens. The Moss and other summer flowering Roses were also over. The principal feature of Mr. Girdlestone's Rose culture at present is, I think, the Tea Roses. Indeed, one could not help sighing as we passed up where the Hybrid Perpetuals used to be grown so well, and to find "*Dahlia Street*" taking their place, and Cabbages occupying it in

being a good exhibition Rose. He had a favourable report to give of Mr. James Wilson, but I very much fear whether the Rose which the same firm has named after him will be quite worthy of the name it bears. That Tea Roses are grown well here is evidenced by the fact that Mr. Girdlestone won the Silver Medal of the National Rose Society for probably the largest bloom of *Comtesse de Nadaillac* ever exhibited, and this in so unfavourable a season as the present, was a great feat. It would be tedious to enumerate the fine flowers we passed—the *Nermets*, *Edith Giffords*, *Pirolas*, &c.; suffice it to say, that all good kinds were to be found here, one of each against a wooden fence, and the remainder of the row planted to the border, some five or six plants in a row, thus giving an excellent opportunity for viewing and recording their doings.

Of course, many good Roses are to be found here. When Mr. Girdlestone met me at the station he had a stick in his hand which might challenge comparison with a Tipperary shillalagh. This was cut from a *William Allen Richardson*, so it will be readily imagined how that favourite Rose flourishes here. *L'Idéale* is a formidable competitor, for it has a lovely variety of tint wanting in the older flowers and seems as if it would be equally vigorous.

It would take up too much of your space to enumerate the charms of this delightful home of flowers; but it may be enough to say that there is perhaps but little of outdoor floriculture that does not find its representatives here, and that intelligence and skill of no mean order are brought to bear on their cultivation, with a success that is apparent on all hands. *Wild Rose*.

FLORISTS' FLOWERS.

THE CHRYSANTHEMUM IN SEPTEMBER.

We had fully-developed flowers of those handsome early-flowering varieties, *Madame Desgranges*, white, with a tinge of yellow at the centre; *G. Wermig*, primrose; and *Mrs. Hawkins*, golden-yellow; the two last-named being sports from *M. Desgranges*. They are right welcome additions to the greenhouse at this season, grown with three flowers on each plant, which is about 3 feet high. There are other varieties which are also welcome inmates of the greenhouse, and beautiful in the open garden for filling beds or borders. The blooms appear before the autumn-flowering *Michaelmas Daisies*, and require the same kind of treatment. From what I have observed in various public and private gardens, the *Chrysanthemum* proper promises well for flowering in November, and should fine weather set in and continue during September, we may have an early as well as a good bloom. The buds are not late; we have been "taking" our buds from the middle of August, and by the end of the first week in September all, or very nearly all, will be set. This setting of the blooms is an important matter, and requires of the cultivator a good eye and a steady hand. If you peer into the centre of the shoot, one of three at the top of each plant, there is the tiny flower-bud, less in size than a pin's head, and immediately below it, in the axil of every leaf, growths will be noticed which are pushing upwards; if these are allowed to grow, the flower-buds will perish, and as they are robbers of the buds from the first, the sooner they are removed the better. Take the shoot in the left hand, hold it firmly, and snap the leaf-buds over with the little finger nail of the right hand, and those leaf growths which are very close to the flower-bud must be removed very carefully indeed, else the bud will go too, and the work of a season will be lost so far as that particular bud is concerned.

We have had some ills to worry us during the season, the sharp frost in May caught the plants, and we now see its effects on the leaves. A little later the leaf-burrowing maggot became a source of worry, and remained for many weeks, every plant had its quota of burrowers; in some instances, a score or more on one plant, we had no alternative but

FIG. 33.—NEOBENTHAMIA GRACILIS. (SEE P. 272)

One is continually coming upon such points. Here, for instance, is a bed of *Oenothera taraxicifolia*, about which I am somewhat puzzled. I have one apparently similar in flower which I received under the name of *marginata*, but its foliage is quite different, and it has an unpleasant habit of getting away from where it was planted and appearing elsewhere. A plant of it I had has entirely gone from where I placed it, and has travelled under the walk and appeared on the border at the other side. Here again we come upon the ubiquitous *Shirley Poppies*, in their fine variety of colours; and, of course, the *Iceland* proper and another, *P. altaica*, with terra-cotta coloured flowers, which goes very well with the *Iceland*. We also came upon a fine plant of the single *Polyantha*, which in my ignorance I supposed at first to be the plant so well known by the photo which appeared in the *Gardeners' Chronicle*, and by Mr. Girdlestone's vivid description of its beauty; but I was soon convinced this was a mere baby in comparison with that which I soon came upon, and which for floral beauty it was impossible, I think, to find anything to excel. It is now from 15 feet to 20 feet high, and about 30 feet in width, and when I

other places. The Hybrids are grown out in groups of one sort, and certainly serve for decorative purposes; they do not consequently receive that individual attention they used to do, when each bloom was carefully watched. In excuse for this lamentable defection, one has to say that Mr. Girdlestone is a busy man, that his engagements have increased very considerably during the past two or three years, and that the Rose show season comes at his very busiest time.

A large number of the best varieties of Teas are grown in rows, so that they come under the careful notice and critical acumen of their owner; frauds are detected and beauties enjoyed, and as Mr. Girdlestone is well-known by raisers of flowers, they are often to be seen here before they are seen elsewhere; and, indeed, I believe some have their doom pronounced here, and never appear before the public. Of the newer Teas, *Ernest Metz*, *Cleopatra*, and *Madame Hoste*, were all considered good; the latter is, perhaps, a little deficient in fulness of flower, but its bud is, I think, the most pointed of any Tea Rose known; and although somewhat thin, not so much so as to prevent it from

to follow them in their windings and destroy every individual specimen by hand. With the advent of July, thrips came in clouds—they always do here whenever the hot weather sets in—the hundreds of Carnations all over the place seem to be a breeding-ground for them, and day by day the tobacco-powder was dusted on to them. We have tried several "patent" appliances to distribute the powder, but after a time we fall back upon the penny tin pepper-box. The thrips are not yet gone, nor will they go until the flower-buds show round, and hard well above the foliage. They lodge and board in the creases of the tender young leaves, and the fight with them must be continued until the leaves are fully developed, and too hard for their sucking apparatus. Ten days ago we saw the first traces of mildew, and the first traces of Potato disease appeared with it. Doubtless certain atmospheric conditions favour these fungoid growths, which, although they may be specifically different, are yet so nearly allied that they thrive under the same conditions of the atmosphere. We can check the mildew for the time with sulphur applied in powder, or used in a liquid state, dissolved in warm soft soapy water. The Potato disease beats us, and ever will, I fear, from the impossibility of reaching it with the disease destroyer.

We began to feed the plants with stimulants about the middle of August, powdered bones and gnan, mixed with three times their bulk of soil, as a surface-dressing, a space being left for two applications at intervals of two weeks. The second time, Thomson's Vine Manure was used. A change of diet is as necessary for plants as for men and animals. Sir Walter Scott states, I think, in *Guy Mannering*, that at one time the labourers on the farms in Scotland used to stipulate that they should not be supplied with salmon oftener than two or three times a week. They tired of the rich food, and, believe me, there is a much closer relation between the cultivator and his plants, in the matter of treatment, than most of us seem to think; at any rate, Chrysanthemums suffer if they are under or over-supplied with stimulants, and every observant cultivator will bear me out when I say that they do best with a change in their diet, and a change of air is good for Chrysanthemums as it is for Carnations. We may go further and say, that they are much more influenced at the time of the development of their flowers by the effects of light and judicious ventilation than we are. The above may seem to be but verbiage to some, but I fear we pay too little attention to the mysteries of cause and effect in their relation to plant-life.

The Editor constantly tells us that, "He that questioneth much shall learn much." I wish he would tell us why some of our plants grow 3 yards in height, while others are content with an altitude of 3 feet? We do not want the extra 2 yards of stem. Our plants of Madame Audiguier will certainly touch 12 feet in height before the flowers are developed. We want varieties like Avalanche and Edwin Molyneux, the best in quality of flowers, and displaying their blooms below the eye of the cultivator; Louis Buehner, too, is a nice dwarf variety. It cannot be a sport from Mrs. Alpheus Hardy, as it is scarcely like it in foliage, and not so tall by half.

Many of the very best new varieties grow to a convenient height, I could name a score. We cannot expect ladies to mount a step-ladder to examine our specimen blooms. We must appeal to raisers not to save seeds from the very tall varieties—we can do without them. The specimen plants are now receiving attention. To make a handsome bush of a large-flowered Chinese or Japanese variety, each individual growth requires a neat stick, those sold in bundles are too thick; we get bundles of laths, and make them of the thickness we like. Pompons, the "Chusan Daisy," as the late Mr. Fortune termed them, need no artificial supports. Some have much better habits than others in this section. They require manure-water now freely, and surface dressings also if the space on the top of the soil admits of it. *J. Douglas.*

DOES IT PAY TO GROW APPLES?

MR. DOUGLAS, in his article on the above subject, says very much of what is true on this subject; but I think he is rather hard on the farm labourers when he so unfavourably compares their work with the spade to that of either tailor or shoemaker. Were he living where I am, in the midst of a purely agricultural district, he would have just reason to apologise for the comparison. I am willing to admit that there are black sheep in every fold, but the average labourer about this part far excels the tailor or shoemaker in the use of the spade, for tailors there are none, but plenty of shoemakers, whom I never see use a spade for the reason that this tool is quite useless here, the soil is of such a character as not to admit its use, being very strong and stony—not exactly clay, but a near approach to it. The four-tined fork is the tool for digging invariably used, and in many cases if it is advisable to go deeper than 1 foot, it becomes necessary to invoke the aid of a pickaxe. Now comes the work which, I think, Mr. Douglas's article under-estimates—that of stirring the soil to a depth of 15 to 18 inches deep by a steam cultivator; in soil of a light nature this depth might be reached, but here it would be a serious task for any instrument to go down to that depth, certainly not for 15s. per acre.

Much of the land hereabouts is moved with the aid of a cultivator, but I have not seen any done deeper than 1 foot, and that certainly not for the price quoted, but just double that. In this respect, I consider the remarks on that point misleading, as would be found out on attempting to prepare an acre of land for fruit culture, where the soil is of the nature described. Still, Apples can be made to pay in this soil, but sorts must be chosen that will succeed, and there are those which will do this. The common mistake is, that of planting too many kinds, without first having proved their suitability to the existing soil.

Those persons who wish to embark on Apple growing only in such a soil as I have to deal with, would do well to follow the plan I have adopted, and which would be found to incur a small labour bill after planting is completed. It is not every person who cares about the trouble and labour which small fruits planted between the Apple trees incur, but who still wishes to make the Apple trees pay a fair return for the outlay, in preference to depending upon corn and other agricultural crops; and besides, those who have a partiality for trees, Apple or otherwise, may ride their hobby, and without a loss in expenditure. Under similar circumstances to these, I planted early last November over 1000 Apple trees in a grass-field, in soil exactly like that described. We planted only twelve varieties, it having been previously proved that Warner's King, Ecliville Seedling, Mère de Ménage, Worcester Pearmain, Cox's Orange Pippin, Irish Peach, and King of the Pippins, did succeed annually, never having for the last ten years failed of a crop.

In addition to the proved sorts named, Bramley's Seedling and Lord Grosvenor were given a trial, and these, from present appearance, justify the selection. At the present time, bush trees of the latter are bearing splendid fruit, quite ready to pick and send to the market, which, if they did not bring the prices quoted by Mr. Douglas, would fetch 5s and 6s. per bushel locally, which would soon pay a return for the outlay.

Instead of breaking up the whole 5 acres, as suggested by Mr. Douglas, we staked out rows, 30 feet wide, for standards, and the same distance apart in the rows. Between each standard was planted one bush tree, and between these rows was arranged another row of bushes, which were kept to within 15 feet of each other in the rows also, so that altogether the land is planted all over at 15 feet apart, the idea being to utilise the space with the bushes until such times that they were interfered with by

the standards as the permanent trees. The reason for retaining the grass between the trees was with the double object of saving labour and of obtaining a hay crop annually, which will pay for all the labour the trees will require, now that they are planted, for the next ten years, and by that time the space between the trees will be limited. What we did in the preparation of the soil was this: a contract was made with a labourer—not a shoemaker or tailor—to dig out the holes 4 feet square on the surface and 2 feet deep, throwing the soil out, the turf and top spit on one side, the subsoil—which in some instances was nothing more than the nearest approach to clay that it is possible to get, mingled with large and small flint stones—on the other side; the bottom of the hole was broken up another 4 inches, and left there, which provided for a quick percolation of surplus water from heavy or continuous rains. We find this a much better plan than draining such land, it not being absolutely necessary to lay drains here; the flint stones act as coveying-channels for the water, and especially when the soil has been once loosened. Although water does not actually lie in this soil, owing to its retentive character, the moisture renders it particularly cold in the winter and spring. The price paid for digging the holes was £15. In filling them in, the worst soil, of course, was put at the bottom, reserving the top spit for the surface; the trees were planted on slightly raised mounds, covering their roots with the turf, chopped about 3 inches square. A good mulching of half-rotted farmyard-manure was laid on the surface, covering the whole 4 feet square directly the trees were made fast in the soil. No manure was mixed with the soil in planting.

In planting Apple trees two very essential points towards achieving success we endeavoured to carry out—that of allowing the roots to remain uncovered the shortest possible time during planting, and staking them at once to prevent the roots being moved by wind-rocking the trees; in our case the roots were but about 3 or 4 inches covered. Many persons make an error in not staking those trees which require it at once, but put it off until all are planted. I make a point of securing all fast the same day they are planted, which I have many times proved by experience is the correct thing to do. I omitted to say that, in planting, the roots of every tree were carefully examined, and any wounded root was trimmed carefully above that part which was broken; this I consider more important than many persons imagine.

Pruning the trees was not a very long job, but required some care and thought. Various are the opinions expressed by different persons as to the right way of dealing with Apple trees the first year. Some aver that the previous year's shoots should only be shortened at the points, while others declare in favour of those pruned to within 4 inches or so of the base. To this latter plan I am inclined, and carried it out in nearly all cases of the standard trees; just a few were left longer to note the difference, which already proves the wisdom of closer pruning. Trees which are cut to within 4 inches or so break vigorously, and grow freely, leaving no bare space behind; but where the shoots were simply shortened a few inches, bare spaces are visible some distance from the base of the previous growth, and the growths made are but weakly. Next pruning-time the points of the longest shoots only will be taken off, allowing the remaining eyes to push into growth, or lay the foundation for future fruit-spurs, which they will do shortly. Many of the shoots on the standard trees are now (August 15) 2 feet long; the bushes have made growths even longer than that; on the whole, the trees look remarkably well, and are forming numerous fruit-buds.

Instead of allowing the trees to flower and bear fruit, nearly all were denuded of the blossom-buds before they had time to expand, which plan, no doubt answered in assisting the growth so much better than would have been the case if much fruit had been allowed to set. In some instances the bush trees showed over twenty trusses of bloom.

With regard to the mulching of the surface of newly-planted fruit trees, I consider it is absolutely essential, to obtain the best results; but I am convinced it can also be carried too far when dealing with soil like ours. Mulching the surface is done with the aim of keeping the roots free from frost during the winter, and maintaining them in a moist state during the summer, and for these reasons it should not be neglected; but there is an evil in this if carried out without any other consideration. Although the mulching maintains the roots warmer during the winter than they would be without it, it must not slip the memory that the same mulching renders the soil cold during the spring, when it ought to be getting warmer. Those who lay on the mulching in November, say, and never think of removing it until it is too late by its decay, do not appear to think the roots would be greatly benefited by having the little soil there is above them warmed by the sun during the early part of May.

paper on *Halophila*, and subsequently by his researches on the difficult genus *Pandanus*; whilst his travels in Rodriguez, Socotra, and elsewhere, furnished him with the means of publishing elaborate treatises on the botany of those regions. Thus in 1874 he was appointed naturalist to the "Transit of Venus Expedition" to Rodriguez, and in 1880 he explored, at the instance of the Royal Society and the British Association the Island of Socotra. *Begonia socotrana* was one of the plants obtained in the latter expedition, with which the Professor enriched our gardens. Professor Bayley Balfour is a most energetic and industrious worker, editing the translation of various German standard works on botany, published by the Clarendon Press, of which the latest has only just issued from the press, the translation of Count Solms-Laubach's *Fossil Botany*, as well as the *Annals of Botany*. In Edinburgh, of course, his services are in constant request, not only in the university class-rooms and

time of my visit they were nearly all in bloom; I counted on some of the spikes as many as thirty-five flowers of the finest quality. The number of flowers on each spike varied from twelve up to thirty-five. One plant of *C. Alexandræ* in a 14-inch pan had sixteen fine leads. This collection consists principally of *O. crispum*, *O. Stevensii*, *O. Warneri*, *O. Halli*, *O. Chestertoni*, *O. guttatum*, *O. Andersonianum*, beside many other very fine varieties; there was also a beautiful specimen of *Oncidium macranthum* in full flower along the roof. Another house is devoted to *Odontoglossums* and *Masdevallias*; of the latter there is a splendid lot of all the leading kinds of the Harryana type. In another house there are some good specimens of *Cattleyas*, including the best sorts of *Trianae*, two or three good *C. labiata*, the true autumn-flowering variety; also *C. Mossiæ*. In this house there are a number of plants of the choicest *Dendrobium*s. Mr. Boyes commenced Orchid-growing some eight or ten years ago. I did not see a single plant in the whole of this collection but what was the picture of health and vigour, showing that he has studied carefully the wants of every variety; moreover, he does not hesitate to give anyone interested in their cultivation the benefit of his experience. This collection of Orchids, although not a large one, is well worth paying a visit to by any lover of them.

A STANDARD OF BEAUTY IN VIOLAS.

Scarcely a day passes, at this time of the year, but I am called upon to express an opinion on the merits of seedling *Violas*. The young amateur sends a dozen flowers and a carefully tabulated list. The old expert sends a box of blooms all numbered or named, telling you they are all good, and saying that the world cannot do without them. This indicates a widespread interest in *Viola* culture, and a great striving after novelties. The question I should like to ask, and endeavour to answer in this short paper, is one something like the following:— Can beauty in a *Viola* be defined? To make it conform to the florist's Pansy will, I am afraid, spoil the *Violas* [Hear! Hear!]. Something altogether different must be aimed at. Certainly, *Violas* must be judged from two standpoints—as bedding-plants and as cut flowers; what is suited for the one purpose being sometimes quite unsuited for the other. For bedding, distinct colours will always be wanted, but other qualities are required, such as a good habit of growth and free continuous blooming, and good substance in the flowers to stand weather, &c. By decided colours, I do not mean white, yellow, and blue only, but all the different shades and combinations of these colours which are effective and pretty in the mass. This brings me to speak of *Violas* in another relationship—namely, as cut flowers, either for table decoration or for exhibition purposes. In trying to decide what forms, colours, and combinations are best suited for these purposes, I find the greatest difficulty. This difficulty is increased by the multitude of fairly good things which are raised from seed every year, and by the temptation to name varieties quite good enough in themselves, but differing only slightly from some in commerce. Every person has his own standard of beauty in a way, and it is difficult, nay, almost impossible, to fix a general standard by which all men may judge of the beauty of such things as the finer *Violas*. If I consult Ruskin, he tells me "that all good colour is in some degree pensive, the loveliest is melancholy." He also says:—"The sensation of beauty is not unusual on the one hand, nor is it intellectual on the other; but is dependent on a pure, right, and open state of the heart for its truth and for its intensity. . . We do indeed see constantly that men having naturally acute perceptions of the beautiful, yet not receiving it with a pure heart, nor into their hearts at all, never comprehend it nor receive good from it." If this is all true, the idea of erecting a standard of beauty must be for ever given up. I cannot help thinking, at least, that before any one becomes really able to appreciate what is lovely in *Violas*, he must enter into a sort of sympathy with his flowers. When this feeling

PROFESSOR ISAAC BAYLEY BALFOUR.

There is no comparison in the growth of trees which have the mulching taken off for a week or two, at the time stated, and returned before there has been time to dry the soil to such a depth as to injure the roots. Where persons make a mistake in this apparently small item, it is in considering that it is incurring too much labour to take off and replace the manure. *S. H.*

laboratories, but at societies and institutions, so that he maintains at the highest standard the renown of the great Edinburgh University in matters of science, and of botany in particular. To him will be referred, as supreme arbiter, any question which may arise as to the interpretation of terms in the schedule of the great show next week.

ISAAC BAYLEY BALFOUR.

THE worthy son of a worthy sire now holds the position so long held by his father, John Hutton Balfour, as Regius Professor of Botany, and Keeper of the Royal Botanic Garden, Edinburgh. He was born in 1853, and after a distinguished career at the University, studied in Germany under De Bary, and became successively Professor of Botany at Glasgow and at Oxford, from which latter university he removed to Edinburgh. Professor Balfour achieved a great reputation in botany by his

SCOTLAND.

BURN PARK, UDDINGSTON.

I HAD the pleasure the other day of seeing this collection of Orchids. There are three very nice houses exclusively devoted to this class of plants. Mr. Boyes tends to them personally, and I must say that this is really as choice and well-grown a lot of plants as one could desire to see. One house was filled with *Odontoglossum Alexandræ* alone, and at the

has been developed, we may find, as Mr. Ruskin says, that we appreciate the most delicate forms and colours, because they are the loveliest, and that we really make no effort to do so. How is it that, in wandering through a border planted perhaps with a thousand seedlings, all different in form, in hue, and in habit, the peculiarities of one or two take possession of me to the exclusion of all the others? How is it that different men, with a true love for *Violas*, would go over the same flowers, and arrive at identical conclusions without being in collusion in any way? This almost proves that there must be a standard somewhere, but how are we to find it? Some one says, take what the public wants and you will be right! This may be a very good commercial maxim, but I do not believe in it, for the reason that the public does not know what it wants. It is looking everywhere for guidance, and waiting to be educated in such matters. I would far rather say, take for a standard the varieties which, by common consent, are admittedly beautiful, whether old or new. To my mind, it will be difficult to get better and more lovely sorts than Duchess of Sutherland and Ardwell Gem; they are simple, pure and delicate selfs, the one lavender, and the other pale yellow. William Neil, Duchess of Fife, and Bridesmaid, are the gems of the last two seasons. All these five are lovely to me on account of their purity and sweetness. There is nothing vulgar in their appearance, and a spray of any one of them would charm the most refined and aesthetic taste. *Wm. Cuthbertson, of Dobbie & Co., Rothesay.*

THE SALE AT MILLBANK.

The distribution by public auction, in Edinburgh, on September 10, of the Millbank collection of exhibition plants, will be a matter of no small importance. Mr. Mitchell, horticultural auctioneer, has been entrusted to wield his hammer over one of the finest collections of specimen *Ericas*, *Azaleas*, stove and greenhouse plants, Palms, Orchids, &c., ever placed before the public in Scotland. Mr. Paterson for a number of years has taken the lead at the Royal Caledonian Societies' exhibitions, and, in spite of considerable competition, has worthily held his own; and in the annals of this society his name figures conspicuously as a prize-winner, always in the first rank. The sale has been fixed to take place on the second day of the International Show, so that visitors may have the privilege of seeing this valuable collection; and the lovers of well-grown plants will have a splendid opportunity of possessing themselves of rare and unique specimens. We especially call attention to the *Ericas*, amongst which *Maraocckiana*, insignis, retorta major, and *jubana rubra* conspicuously figure. The *Azaleas* are also models of cultivation, well set with bloom for the next season, *Duc de Nassau*, *Charmer*, *Iveryana*, *Stella*, *Mrs. Turner*, and *Deutsche Perle*, are particularly worthy of notice. The Palms are also worthy of consideration, notably *Phœnicophorum Sebellarum*, *Cocos Weddelliana*, *Phœnix rupicola*, and *Kentia australis*. Of the Orchids it would be worth while to mention the whole, but *Masdevallia Walkeriana*, *M. Lindeni*, *Cypripedium hirsutissimum* and *C. Spicerianum* may be particularly noted, they are all in good and creditable condition. *W. E. D.*

THE POLLINATION OF FLOWERS.

In the lecture-room of the Royal Botanic Garden, Edinburgh, on Saturday evening last, Professor Bayley Balfour delivered another of the course of botanical lectures to working men. He showed, in speaking of the function of the flower, that it was concerned in the production of the seed, and so in the reproduction of the plant. The act of pollination must be accomplished in the first instance. It might be self-effected in a flower, but this was prevented in many flowers by various arrangements, e.g., the relative position of anthers and stigma, as in Orchids; by the non-simultaneous ripening of anthers and stigmas in a flower, as in Plantain, where the stigmas were ripe first; and the Mallow, where the anthers ripened first; by

the stamens and carpels being placed in different flowers, as in *Campion*. The Professor also spoke of the various means by which cross-pollination was brought about by animals and the elements.

CUTHBERTSON'S NEW LEEK.

This new variety of Leek, raised by Mr. Cuthbertson, Public Park Nursery, Rothesay, Buteshire, and sent out by him this season, seems to fulfil all the conditions required of an exhibition Leek. At Sangball, Chester, Shrewsbury, and at Glasgow (Hutchistown Gardens), they were greatly remarked. At Ferdale show (Wales), these Leeks were "the feature of the show."

CHINA-GRASS IN DUNDEE.

We have before us a sample of this material made from the fibre of *Boehmeria nivea*, a kind of Nettle, and prepared by Messrs. Donald Brothers, Victoria Chambers, Dundee. The hanks are silky, soft, brightly-tinted, ready for the loom. Its success is already assured. Where the French material cost 3s. 9d. per pound, this costs but 2s. 6d.; where the former takes over twenty days to prepare, the latter is turned out all complete in eight days.

Here surely, if anywhere, "Necessity has proved to be the mother of invention." For we have to compete with the Saxons and Belgian working (by the family) at the rate of half a franc a day each member; add to this the advantage of working up a new vegetable fibre in competition with dearer materials used here, and there are good grounds for cultivating the inventive faculties. And thus we are able to hold our way in the world's markets, always retaining beauty of design, and beautiful—though necessarily much less costly—material.

TREES AND SHRUBS.

ABIES OR PICEA MAGNIFICA.

We are indebted to the Rev. Robt. Dayrell, of Lee Grange, near Shrewsbury, for a photograph of a fine plant of this species. It has attained a height of 19 feet 7 inches, and a diameter of 11 feet. This is one of the finest specimens that has come under our notice, and is a symmetrical well-grown tree. Mr. Dayrell's collection of Coniferae is very rich in species and varieties.

THE WEEK'S WORK.

THE FLOWER GARDEN.

THE FLOWER-BEDS.—The recent heavy rains have committed great havoc in the beds, flowers having been totally stripped from the stalks in many instances, and the plants themselves much knocked about; and this coming at a time when all the beds were resplendent masses of colour, has made the mishap all the more striking. Carpet-bedding also looks the worse for the deluge, and where *Dahlia*s and such-like plants were not properly secured great damage has been done. However, if we are vouchsafed fine weather, the garden will again become bright. Meanwhile clear off all the dead and damaged flower trusses and leaves as speedily as possible, and sweep lawns and walks which are greatly litter-strewn; afterwards sweeping over the green sward, and rolling the latter. Beds of *Verbenas*, *Petunias*, *Phlox Drummondii*, *Gaillardias*, and similar plants will to be cut into shape, and the shoots thinned out, otherwise they will not show to advantage. Continue to pick off the flowering shoots of *Cineraria maritima* and other foliage plants as they appear, and peg down and pinch the shoots of *Perilla nankinensis* and *Iresines* as occasion renders necessary. Trimmings of the variegated *Mesembryanthemum*, of *Alternantheras*, variegated *Alyssum*, *Gnaphaliums*, *Pelargoniums*, and *Verbenas*, may all be used as cuttings to increase the stock of these plants.

HERBACEOUS PLANTS.—These, too, show sad effects of the unpropitious weather. The removal of broken shoots, and the securing of the remainder to their supports will demand early attention. Perennial Sunflowers, *Phloxes*, *Michaelmas Daises*, and *Anemone japonica*, both rose and white varieties,

are in good condition, the rain having but little effect on them. *Hyacinthus candicans*, whose tall flower-spikes are thickly studded with beautiful white pendent flowers are still effective. This "Cape Hyacinth" is not grown so extensively as it deserves to be, the spikes of it contrast most effectively with those of *Lilium tigrinum* *Leopoldi*, *L. lancifolium*, *L. Krætzeri*, *L. auratum*, and varieties of the *Gla-diolum* generally, intermixed with herbaceous plants for giving variety to the autumn display. *H. W. Ward, Longford Castle, Salisbury.*

THE KITCHEN GARDEN.

CABBAGES.—The ground should now be prepared for the main crop of spring Cabbages, for which the recently-cleared *Oaion* beds, if previously well manured, will prove excellent spots. But if the soil of the garden is heavy and tenacious, it will be good practice to dig and manure a quarter for them. I prefer to plant Cabbages on rich land made firm by treading, or on the site of an old Strawberry bed, with no more preparation than breaking up the surface. If the land be poor, it should receive a heavy dressing of rich manure, and should be bastard trenched, which is especially necessary when the large-growing varieties are to be planted, and where the stumps are left standing for the supply of a second crop. If early and late kinds are to be planted together, keep each by itself. A distance of 1 foot apart is sufficient for the early sorts of Cabbages, and 1½ to 2 feet between the rows for large varieties. Always elect the strongest plants, and plant as soon as they are ready, and in showery weather. It is better in most gardens to plant in drills, but in heavy land planting on the flat is more desirable. Where slugs abound, lime and soot should be freely used on the soil round about the plants; and if clubbing is feared, the plants should have their roots dipped in a puddle made of soot, wood-ashes, and clay, with a handful of sulphur thrown in.

CARROTS.—Thin the late sowings of Early Horn varieties at first to about 2 inches apart, the later thinning being done as the roots are drawn for consumption. Keep the hoe in constant use between the rows.

CELERY.—Proceed with the earthing-up of the early crop, doing it at intervals of about a fortnight, first chopping down a quantity of soil from the sides of the trenches, and breaking it up finely and leaving it for fourteen days before placing it around the plants. In earthing-up, hold the leaf-stalks in their natural position close together with one hand, whilst the soil is drawn up around them with the other. This operation should only be done during dry weather. A final watering should be afforded the plants before the earthing-up is begun.

WEEDS.—During the present month, opportunity should be taken to thoroughly clean the garden of weeds, and one or two good cleanings made now will go a long way towards maintaining a clean appearance for the rest of the year. Where the hoe cannot be used, as in such cutting weeds, hand-weeding must be resorted to. The removal of all decayed vegetables, spent crops, or other unsightly objects should be attended to. Manure intended for use this autumn should be turned over during showery weather, and thoroughly mixed and otherwise prepared, and accumulations of rubbish burnt, and the residue passed through a sieve or screen. Of the finer parts of these screenings a portion should be kept in a dry state for dusting over seed beds and young crops when necessary. *C. J. Waite, Glenhurst, Esher.*

THE ORCHID HOUSES.

THE EAST INDIAN ORCHIDS.—The nights having become cold for the season, much attention must be paid to the temperatures, and during the day the warmth should be kept up by means of the fires when storms arise. The growth of a great number of the plants which are placed in shady parts of the houses is unusually soft this year, and much care will be needed to ripen them; and to this end the ventilators should not be quite closed for more than two hours, and this only when the plants are undergoing fumigation. Take the precaution to give the warmer houses a mild fumigation with tobacco once or twice a week, which will do the plants no harm, and which if neglected, no matter how careful one may be, thrips will be sure to make their appearance, and then strong measures will be required to stop the injury to the plants. Sometimes shading will not be necessary, except for those plants which are very full of

sap from the loog continued dull weather. I have for many years ceased to use shadings on Cattleyas after September 1, but in case of strong sunshine occurring after this date some amount of it will be beneficial. The Phalanopsis may for one month longer be afforded very weak liquid-manure, such as guano-water or farmyard drippings, which is what my plants receive alternately each week. Maintain a genial temperature for some time yet, the East Indian house not under 70° during the night; the Cattleya house, 68°; the intermediate house, 60°; and the cool division at 50°. *A. G. Catt, Parkfield, Hallow.*

FRUITS UNDER GLASS.

FIGS.—The trees in the earliest house must now get thorough exposure, and, if the wood is crowded, it should be thinned, as it is impossible to get well-ripened shoots unless this is done, so that early thinning is an important operation when early fruit is required; indeed, it is best to sacrifice a few late-formed fruits in the early house than to delay the ripening process. Continue to syringe the trees in the afternoon on bright days, so that the foliage may remain clean to the last, and afford water so that the roots do not suffer from want of it; and if a good mulch is applied when the second crop is swelling up, less water will be required. The top and bottom ventilators should be opened wide, and a little warmth maintained in the hot-water pipes in dull weather and on cool nights until the new wood gets thoroughly ripened. Early Figs in pots that have finished growing may be removed to an open sunny border and plunged in, but taking care to keep worms out of the pots. Plants in bearing should be afforded manure water, with free circulation of air. Any shoots not wanted may be thinned out, which will hasten the ripening of fruits and wood, as there will be no time after the fruits are gathered; mulching the surface with rich manure-water thoroughly when watering is required.

TOMATOS.—Now is the time to secure plants for winter cropping; and as is now well understood, the fruiting plants in the winter always need much care if a fair crop of fruits is to be gathered at that season, and delays now make much difference in the size of the plants. I advised preparation of the late lot of plants a month ago. These should now be freely growing, and whatever way the plants are raised, either from cuttings or seeds, no check should be given them; but they should be shifted into their fruiting pots, as the pots they stand in get full of roots. A cold frame or house is better for them than a warm pit, the temperature afforded ranging at night from 50° to 55°, giving fire-heat only if the weather be rainy and sunless, and then airing the place freely at the top by day. In potting, use well-drained pots, and good loam with a sprinkling of bone-meal, other manure is not required, and pot firmly, as a hard, stout growth is what is wanted, and pots of 9 to 10 inches in diameter are useful sizes. No difficulty will be experienced in keeping up the supply of late fruits till the end of the year from plants just coming into bearing, so that the winter fruiterers should be allowed to make free growth, allowing the fruit to set so that they will come after the autumn-fruiterers are done coming into bearing. A batch of cuttings from good kinds should be struck, putting one cutting in a 60 or three in a 48 sized pot. These plants give fruits much earlier in the spring than those from seed. *G. Wythes, Syon House, Brentford.*

PLANTS UNDER GLASS.

DUTCH BULBS.—The bulb season being at hand, no time should be lost in ordering the requisite number of bulbs for all purposes, as by procuring them at an early date better results are obtained than by buying late. Where a long succession of Hyacinth bloom is required, the bulbs should be potted at different times; those intended to bloom at Christmas being potted forthwith, and those to come later should be potted at intervals of three weeks up to the middle of the month of November. A good compost for Hyacinths consists of two parts rich turfy loam, one of leaf-mould, one of rotted manure, and sufficient sand to keep the whole porous. Mix all these ingredients together, if possible, several weeks previous to potting. For decorative purposes, 5-inch pots are large enough, but exhibition bulbs require 6 inch pots. New pots will require to be soaked in water for twelve hours, afterwards allowing them to dry before using them. One hollow crock placed carefully in the bottom of the pot and covered entirely with a rough moss, or coarse cocoa-

nut fibre, will be found ample drainage for Hyacinths. In potting, fill the pots nearly full of compost, pressing it moderately firm, and make a small hole in the centre to receive the bulb, which should be made quite firm in its bed, and being about half covered with soil, but care must be taken not to press the bulbs too hard, as to cause the soil below it to become very solid—a frequent cause of the bulbs being forced upwards and out of the soil when roots are being made. If the soil is in a properly moist state, no water will be required after potting. Stand the pots on a coal-ash bottom in an open position, and cover them with Cocoa-nut fibre, coal-ashes, or sand, to a depth of 6 inches.

ROMAN HYACINTHS.—A most useful class of bulbs for early work, which may be had in bloom in November if the roots be potted without delay. Put four roots in a 5-inch pot, and treat them like the above. By fortnightly pottings, Roman Hyacinths may be had in bloom throughout the winter.

TULIPS.—These should be treated in exactly the same manner as the Hyacinths, except that several bulbs, according to their size, and the purpose they are intended for, may be placed in a pot. The best single-flowered varieties for early forcing are the scarlet or crimson Van Tholls, which, if they are potted now, will bloom at Christmas; though not large, these varieties are very popular. Others for pot-culture are White Pottbakker, large white; Joost Van Vondel, one of the best whites; Duzzat, dark scarlet; Van der Neer, fine rich purple; Keizerskroon, scarlet, with yellow border; Cottage Maid, white, flushed with pink; and Princess Marianne, white. Should Tulips be required for filling baskets or other like receptacles, they are best when grown in shallow boxes, filled with decayed manure and leaf-mould, afterwards lifting them separately, and planting them when in flower, as by so doing, an uniform display is secured.

FREESIA REFRACTA ALBA.—This is one of the most useful flowers, and one that is gaining in estimation. The flowers, white, tinged with yellow on the lower petals, will last in good condition when cut for several days. Four or five bulbs may be planted in 5 inch pots in light rich compost, and placed in a cold frame, covering the pots with Cocoa-nut fibre until leaf-growth begins, when the covering must be removed. These bulbs want but little water until they have started well into leaf, when they may be placed near the glass in a warm greenhouse. By potting the first portion of the bulbs about the beginning of the present month, flowers may be obtained by the end of the year; and by potting a few bulbs at intervals, they may be had in bloom till late in the spring.

POLYANTHUS NARCISSUS.—These bulbs are invaluable for early forcing, especially the double Roman and the paper-white varieties, and may also be potted in a rich compost, a little deeper than Hyacinths, and as soon as received from the dealer. Jonquils should also have similar treatment to the above, covering the pots with Cocoa-nut fibre.

IXIAS.—These are beautiful little plants for the greenhouse, which may be potted at any time during this month, using 5 or 6-inch pots, with from five to seven bulbs in a pot, of 48-size. Let the pots be well drained, and make use of a rather light compost, afterwards placing the pots in a cold frame; and to prevent the soil getting too dry, plunge up to the rim in Cocoa-nut fibre. Withhold water until they have started well into growth, when a portion of them may be removed to a warm greenhouse or pit, placing them in a light position, affording more and more water as growth proceeds. *R. Milner, Penrice Castle, Swansea.*

THE HARDY FRUIT GARDEN.

PREPARATIONS FOR PLANTING.—If it is intended to plant extensively, timely preparations should forthwith be commenced, and in selecting the ground to be planted, always, when possible, choose that which slopes towards the north, and has shelter from the north-east and west. Ground which has a sloping surface requires little or no artificial drainage, and the shelter enables the trees to escape the cutting winds and frosts of spring which cause so much loss. If long-lived trees and good crops are looked for, it is well to remember that what is worth doing at all is worth doing well. See that the drainage is efficient. Trench the soil fully 2 feet where time and means will allow of its being done, or bring the steam cultivator into use, stirring the soil deeply, and thoroughly freeing it of couch grass and other deep-rooted weeds,

putting plenty of manure into it if it be light and poor soil, and road-scrappings into heavy land. Plum, Pears, and Apples, should always have ample space between the trees, or crowding will occur in a few years after planting, the fruit will be small, and the wood will not ripen well. Do not plant for variety's sake, but plant only those of good quality in their various classes. King of the Pippins, and Ribston Apples, and several others, which are said by some persons to be fast dying out, will, if planted on good soil, and worked on healthy stocks, grow and produce as good fruit as they did in years gone by.

BLACK CURRANTS, GOOSEBERRIES, NUTS, AND RASPBERRIES.—These may be planted between the rows of Apples, &c, and will quickly yield profitable crops, and I may say here that even in Kent there is yet plenty of room for new plantations of fruit trees, and much need for the uprooting of many old and unprofitable ones.

WALL TREES.—Old trees past bearing good fruit should be replaced with vigorous young ones, taking the opportunity to have the walls themselves pointed and put into good order, and the old worn-out soil replaced with good sweet pasture loam. The area under cordons should be at first 3 feet wide and 2 feet deep, and this should be extended in width in a couple of years after planting. The bottom should be broken, and the land generally well drained; but if each station be drained separately, some turves, with the grassy side downwards, should be placed over the drainage materials. The best soil for the Pear is a mellow loam, with a sprinkling of plaster or old mortar, with a moderate quantity of wood-ashes or burnt refuse added, and a few crushed bones. Cordons should be planted 15 inches apart, which will soon cover the wall with fruitful growths, and the fine fruits quickly reimburse the planter for his outlay. New walls which are to be planted this autumn should have the borders put in readiness for planting. Peaches and Nectarines should receive attention first, and afterwards, the Pears; by making a proper selection of varieties of the former two, the trees being clean, worked on healthy free stocks, and planted in good borders, we can with due care produce fruits equal to those that were grown out-of-doors a generation since. *H. Markham, Mereworth Castle, Maidstone.*

THE APIARY.

PREPARATIONS FOR WINTERING.—The sooner feeding, if necessary to get stocks up to full weight, is completed the better, so that bees can go into winter quarters, with all stores properly sealed. Some bee-keepers make the mistake of extracting all the honey from the brood-frames in the autumn, under the idea that, if it is replaced with syrup, all goes on well, and that they can get the advantage of the difference in value between the sugar used and the honey. It is not taken into account, however, what a laborious task has been imposed on the bees by so doing, and what expense to bee-life the wear and tear of taking down and sealing over 20 lb. or more of syrup entails, at a time of year when there is the smallest chance of their recouping themselves by the addition of fresh generations to their number; the consequence being, that the old bees that have had the extra labour die prematurely in the spring, and the bee-keeper wonders what has been the cause of the disease called "spring dwindling," and any extra profit that may have been made by taking the last ounce of honey is now at vanishing point. Many bee-keepers are in the habit of contracting hives for winter, so that the bees are restricted to six or seven frames, because the opinion has been that they are warmer under such conditions, and winter better. It was, however, proved not long ago, by careful experiments with the thermometer, that bees are just as warm behind frames of empty comb as they would be behind a dummy or division board, no doubt by reason of wax being a bad conductor of heat and cold. The only fear, then, in leaving combs uncovered by the bees in the hive all the winter is, that they often get mildewed and rotten, but if our ventilation is right, this is not likely to occur.

The writer is an advocate of plenty of room underneath the frames for wintering, and half-bodies previously in use for shallow frames or sections come in nicely for this purpose, if the hive, is so constructed that the brood-chamber can be raised in that manner. An air space should also be ensured between the quilts and the roof of the hive, so as to allow a free circulation of air there, as if this does not exist they get damp, and remain in that condition all the winter. *Expert.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

FRIDAY, SEPT. 11. Dundee Horticultural Association meets.

SHOWS.

TUESDAY, SEPT. 8. Royal Horticultural Society: Show of British Ferns, Verbenas, Orchids, &c., Fruit and Vegetables. Lecture at 3 P.M., by Mr. Geo. Paul, on "Hardy Water and Bog Plants," at the Drill Hall.

WEDNESDAY, SEPT. 9. Brighton and Sussex (two days). National Chrysanthemum Society (two days). York Ancient Florists. Blantyre. Royal Caledonian International Exhibition, Edinburgh (three days).

THURSDAY, SEPT. 10. East Anglian Horticultural Club. Norwich, Dahlias, Fruit, and Vegetables (two days).

SATURDAY, SEPT. 12.—Gala-dinies.

SALES.

MONDAY, SEPT. 7. Dutch Bulbs, at Protheroe & Morris' Rooms. Extensive Importations of Bulbs from Holland, Lilioms, &c., at Stevens' Rooms.

TUESDAY, SEPT. 8. Dutch Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Stove and Greenhouse Plants, at the Nursery, London Road, Croydon, by Messrs. Protheroe & Morris. Freehold Land at Tatsfield, specially adapted for Fruit Growing, by Messrs. Protheroe & Morris.

WEDNESDAY, SEPT. 9. Dutch Bulbs, at Protheroe & Morris' Rooms. Extensive Importations of Bulbs from Holland, Lilioms, &c., at Stevens' Rooms.

THURSDAY, SEPT. 10. Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of Millbank Collection of Specimen Plants at Edinburgh, by Mr. Mitchell.

FRIDAY, SEPT. 11. Imported and Established Orchids, at Protheroe & Morris' Rooms. Stove and Greenhouse Plants, at the Moat Nursery, East Grinstead, by Messrs. Protheroe & Morris.

SATURDAY, SEPT. 12. Dutch Bulbs, at Protheroe & Morris' Rooms. Extensive Importations of Bulbs from Holland, Lilioms, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—58°.8.

The Great Show in Edinburgh. For the convenience of the large contingent of gardeners who will visit the great show of the Royal Caledonian Horticultural Society next week, we

now give brief indications of the more important objects of horticultural interest in and about the city, together with directions as to the manner in which they may be most conveniently visited from the centre of the city. As to the Show itself, some idea of its magnitude may be inferred from the fact that there are already over three thousand entries. Prize money to over £1,300 will be given in addition to Veitch and Turner Memorial medals.

The Royal Botanic Gardens and Arboretum.—These are the dominant botanical and horticultural attractions in Edinburgh. Particulars of these gardens, and of the extensive collection of plants, trees and shrubs therein, will be found in our issue of July 11 of the present year, p. 41. The cable-cars from the Mound to Trinity pass the entrance to the gardens every few minutes.

The City Gardens.—Edinburgh possesses, perhaps, more public gardens and parks than any other city of equal size in Britain. Under the city gardener's superintendence, there are not fewer than thirty-six enclosures, varying in area from half an acre to 120 acres, devoted to ornamental gardening; the principal of these are the Princes Street Gardens, which occupy the valley which divides the old from the new town. These gardens are a most charming feature of the city, and have assumed their beautiful character since the appointment of Mr. Angus A. McLeod as city gardener in 1875.

NURSERIES AND OTHER COMMERCIAL ESTABLISHMENTS.

Messrs. Thomas Methven & Sons.—This firm has three separate nurseries: (1) Leith Walk Nursery, the head-quarters of the firm, and which is accessible by the Leith and Newhaven cars which leave the General Post Office and pass the nursery gates every few minutes. The stock here consists of choice Rhododendrons and other hardy ornamental evergreen and deciduous shrubs, Vines, Clematis, Tea Roses, forest trees, stove and greenhouse plants, &c. (2) Warriston Nursery; this is situated in Inverleith Row, opposite the entrance to the Botanic Gardens, and contains a collection of choice Conifers, Hollies, &c., while the houses are filled with Palms, Orchids, Ferns, and a general assortment of decorative plants. (3) The Fettes Nursery, is distant from the Warriston Nursery only about five minutes' walk, and is devoted to forest trees, fruit and ornamental trees and shrubs, Roses, &c.

Messrs. Dicksons & Co.—The nurseries of this firm are three in number: (1) Pilrig Nursery; the Leith cars, from the G.P.O. every few minutes, pass the top of Pilrig Street, alongside which the nursery lies. The stock consists of ornamental trees and shrubs, florists' flowers, herbaceous and alpine plants; the extensive glass department being occupied with a general collection of stove and greenhouse plants. (2) Near by is the Redbraes Nursery, in which Conifers and ornamental trees and shrubs are the principal stock. (3) The Liberton Nursery, near Liberton Village, is approached by the Rowburn and Newington cars, which leave the G.P.O. every few minutes; the stock here is chiefly fruit trees.

Messrs. James Dickson & Sons, Inverleith and Fettes Nurseries; cable-cars from the Mound, passing the Botanic Gardens. Ornamental trees and shrubs, forest and fruit trees, choice Conifers, Roses, &c., are comprised in the stock.

Messrs. Ireland & Thomson.—This firm has three nurseries: (1) Golden Acre, Granton Road; cable-car from the Mound; contains extensive glass department, devoted to Orchids, Ferns, Palms, and general collection of stove and greenhouse plants; outdoors, forest trees and shrubs. (2) Craighleith Nursery; cable-car from Frederick Street to Comely Bank. Outdoors, stock consists of Conifers and ornamental trees and shrubs, Roses, &c.; indoors, stock of rare hardy and half-hardy shrubs are reared. (3) Lynedoch Place, off Queensferry Street; any car to west end of Princes Street; stock, Palms and other indoors decorative plants.

Cunningham, Fraser & Co., cable-car from Frederick Street to Comely Bank. A repository for rare and interesting plants of all kinds. The stock is rich in Hollies and other evergreen and deciduous shrubs, herbaceous and alpine plants, and such *recherché* things as *Azalea procumbens*, *Cassiope fastigiata*, *Mutisia decurrens*—the latter flowering freely on the walls—and many others.

Messrs. R. B. Laird & Sons, West Coates and Pink Hill Nurseries; Rowburn and Cottbridge cars from General Post Office pass West Coates every ten minutes. Palms, Camellias, hardwooded greenhouse plants, Ferns, &c., are the principal stock in this branch of the firm. Pink Hill Nursery is about 2 miles distant westward. The Corstorphine coach from Cottbridge passes the nursery gate about every hour. Choice Conifers, ornamental trees and shrubs, fruit trees, Roses, and florists' flowers are the leading components of the stock outdoors; while indoors, the collection comprises the usual classes of stove and greenhouse plants.

Mr. John Downie, Beech Hill Nursery.—Cottbridge car from G. P. O., thence per Corstorphine coach. Ornamental trees and shrubs, fruit trees, Conifers, florists' flowers, and herbaceous plants are the leading components of the stock outdoors. Indoors, tuberous Begonias, Calceolarias, Cinerarias, &c., are specialties.

Scottish Mushroom Company.—This company carries on its operations in the disused tunnel of the North British Railway Company extending from Scotland Street Station to Waverley Station, a distance of about three-quarters of a mile. The office and entrance to the tunnel are at Scotland Street Station, which is in an almost direct line from Princes Street North, *via* St. Andrew Street.

Messrs. Wm. Thomson & Sons, Tweed Vineyard, Clovenfords.—About 30 miles by rail *via* Peebles, from Waverley Station. The world-renowned Grape production of this establishment, which is this year as splendid as ever, cannot fail to attract many of the visitors to Edinburgh on the occasion of the Caledonian Flower Show.

Messrs. MacKenzie & Moncur, horticultural builders, Upper Grove Street. Tram-car to Haymarket, from which the works are only a few minutes' distant.

Messrs. Low & Sons, horticultural builders, Gilmore Park, Merchiston. Tram cars *via* Gilmore Place.

PLACES OF HORTICULTURAL INTEREST IN AND AROUND EDINBURGH.

The Gardens, Dalkeith Park (seat of the Duke of Buccleuch; Mr. Malcolm Dunn, gardener).—From Waverley Station to Dalkeith or Eskbank, half a mile distant from the former, one mile from the latter; a place of world-wide fame. Mr. Dunn's eminence as a gardener is a guarantee that visitors will always find much to interest them. Pines, Grapes, Peaches, Figs, &c., extensively grown indoors; also plants of all kinds. Outdoors, comparative trials in vegetables will have an interest for many, and the extensive orchard, well stocked as it is with Apples, Pears, Plums, &c., will be found generally interesting and instructive (see fig. 35, p. 281).

Newbattle Abbey (seat of the Marquis of Lothian; Mr. McHattie, gardener).—From Waverley station to Eskbank, from which latter the entrance to the gardens is about ten minutes' walk. An extensive and well-appointed place in which all departments exhibit careful and skilful management. Splendid Grapes, Peaches, &c., in the fruit departments; excellent selection of Orchids, perhaps the finest seedling tuberous Begonias to be seen in Scotland; an excellent general collection of decorative plants indoors; outdoor departments all befitting a first-class establishment in extent and in keeping (see fig. 36, p. 283).

Melville Castle (Viscount Melville; Mr. George Mackinnon, gardener).—Eskbank, from which the gardens are distant about half an hour. Superb Grapes and orchard-house fruit, also splendid hardy fruit; an extensive and well-managed kitchen garden; flower-gardening excellent.

A VINEYARD IN MADEIRA.

Oxenford Castle (The Earl of Stair; Mr. Smith, gardener).—To Dalkeith, thence by coach about four miles. First-rate Grapes, Peaches, and Nectarines; a remarkable brown Turkey Fig, filling a large house by itself, now swelling up an enormous second crop; Apricots on walls, remarkable for perfect health and great crop of unusually large fruit. All stone fruits exceptionally fine; extensive place, well managed.

Easter Duddingstone Lodge (Chas. Jenner, Esq.; Mr. Chapman, gardener).—Waverley to Joppa; entrance close by station. An extensive collection of hardy herbaceous and Alpine plants, and rare trees and shrubs, hardy Ferns, &c.; good range of glass, devoted to fruit and plant culture; but the hardy plants of all classes are the feature of the place, and Mr. Jenner's special delight.

Salisbury Green (Mrs. Nelson; Mr. Laing, gardener).—Newington or Rowburn cars from General Post Office to Preston Street, whence a short walk in the direction of Arthur's Seat leads to the entrance-gates. A first-class villa residence, with beautiful grounds and some fine old trees, the whole beautifully environed on the east by the picturesque hill above named. A good collection of Orchids and miscellaneous stove and greenhouse plants, well grown.

Oswald House, Oswald Road (Jas. Buchanan, Esq.; Mr. Geo. Wood, gardener).—Morningside circular route cars from G. P. O. Extensive collection of Orchids and stove and greenhouse plants.

Millbank (W. Syme, Esq.; Mr. John Paterson, gardener).—Morningside circular route cars to Whitehouse Loan. The best collection of Ericas and other hardwooded plants in Scotland. The entire collection is to be sold on September 10, the second day of the show. The specimen Ericas, &c., are of rare size and in perfect health.

Carron House (T. D. Brodie, Esq.; Mr. Mungo Temple, gardener).—Waverley or Caledonian stations to Grahamston. About 2 miles distant therefrom. The famous Carron Ironworks lie on the way. The gardens are new, having been laid out by Mr. Temple within the last nine years. Admirable and extensive ranges of glass. Good Grapes, grand Peaches, Figs, &c., Orchids for decorative purposes, and stove and greenhouse plants.

Callendar House, Falkirk (James Forbes, Esq.; Mr. Boyd, gardener).—Same station as preceding. Grapes a specialty, but all departments well done. Mr. Boyd's unflinching success, with Muscat Hamburg and other varieties, which are difficult to colour, is notorious. In point of finish they are this year equal to anything he has ever produced. All other varieties are also well up.

Bantaskin, Falkirk (James Wilson, Esq.; Mr. Mitchell, gardener).—An extensive collection of Orchids, Ferns and other stove and greenhouse plants; some choice Conifers, and grand old Yews, growing in a Roman dyke, which runs through the beautiful grounds.

Park Hall, Polmont (Thomas Livingston Learmont, Esq.; Mr. William Murray, gardener).—From Waverley Station to Polmont Junction, 1½ mile from station. Very superior Grape and other fruit culture, including Tomatoes, Melons, Cucumbers, &c., on a very extensive scale.

Norwood House, Alloa (J. Thomson Paton, Esq.; Mr. Kirk, gardener).—From Waverley station to Alloa, *via* Forth Bridge. A charming place, in which everything is well done, and from which some of the finest Grapes that will appear in the Waverley market next week will come. Visitors anxious to see the Forth Bridge from the Firth may sail from Leith to Alloa pier, and have what is by many regarded as the finest view of the bridge, with access to Norwood House at the same time. The distance from the pier to Norwood House is about fifteen minutes, and from the railway station about ten minutes.

Gosford (The Earl of Wemyss; Mr. John Brown, gardener).—Waverley Station to Longniddery.

The first lodge entrance to the park is within five minutes' walk of the station, but visitors have a walk of somewhere about two miles through the splendid park before reaching the gardens. This is a princely place in its proportions. During the past eight years extensive improvements have been going on under the direction of Mr. Brown. On a future occasion we may have something to say in detail about these improvements; at the present time space will only admit of our saying, that visitors in quest of artistic ideas on a large scale will find some gratification in the developments which are not quite finished here.

Archerfield (Mrs. Ogilvy Nesbit Hamilton; Mr. James Morrison, gr.).—Waverley Station to Dirlleton, distant about 3 miles. The characteristics of the place are excellent flower gardening and all-round good home gardening.

ROYAL GARDENS, KEW.—We are requested to give publicity to the following announcement:—"The Director of the Royal Gardens, Kew, regrets that he cannot undertake to name ordinary garden Orchids for foreign cultivators, unless they are recognised correspondents of the establishment."

ROYAL HORTICULTURAL SOCIETY.—On Tuesday, Sept. 8, there will be an exhibition of British Ferns and their varieties. The Silver Challenge Cup, won at the Fern Conference last year by Dr. E. J. Lowe, will be again competed for, and will be awarded as the 1st prize. The 2nd prize will be £2. Amateur growers of Verbenas will have a chance of distinguishing themselves also, as a Silver Flora Medal, and various sums of money are offered as prizes. In the afternoon, Mr. Geo. PAUL will read a paper on "Hardy Water and Bog Plants."

VINE CULTURE IN MADEIRA.—We are indebted to the courtesy of one of our correspondents, Mr. HARCOURT POWELL, for the photograph, taken by himself, of a vineyard in Madeira (see Supplementary Illustration). The wines of Madeira were better known to our forefathers than to ourselves. Troubles in the shape of mildew (*oidium*) broke out in 1852, and well nigh ruined the Vine-growers. This plague was stayed by the application of sulphur, but only to be followed in 1873 by a worse pest—the Vine louse, or *Payloxera*. The application of bisulphide of carbon to the roots, and the grafting of the Vines on American stocks, have been so successful that the industry is again reviving. For climatal reasons it seems improbable that the insect will multiply with the same fecundity that it does elsewhere. The stocks of old and maturing Madeira in the hands of houses like COSSERT GORDON & CO., BLANDY BROTHERS, and LEACOCK, are very large, and are said to be fully equal in quality to the Vines produced before the *Oidium* inflicted so much mischief in 1852. The following account of the culture of the Vine in Madeira is taken from Mr. J. Y. JOHNSON'S work on Madeira (DOLAN & CO.), an excellent handbook for the visitor. "The Vine is propagated from cuttings (*bacellos*) planted at a depth of from 3 to 6 feet, and there is usually no produce for the first three years. During the second or third spring it is trained along a trellis (*latadus*) made of cane (*Arundo donax*), and this trellis is supported by stakes at 3 or 4 feet from the ground. This allows the labourer to creep underneath, and do any work that may be needed. The operation of pruning in the lower region is undertaken in February, shortly before the buds make their appearance. Little is cut away, the plant being allowed to run to great length. The flowers usually show themselves in the early part of May. As the Grapes advance towards ripening, leaves are from time to time removed, to admit the sun's rays to the fruit, and to induce the plant to throw its strength into it. The leaves are much relished by cattle and goats. The vintage commences at the end of August or beginning of September, according to the season, and terminates at the upper zone of the Vine region in October. At the north, the vintage takes place two or three weeks later. The rats, lizards, and wasps destroy a considerable part of the produce."

THE NEW GARDENER AT CHATSWORTH.—We learn that Mr. WILLIAM CHESTER, who for thirty years has filled the post of foreman of the large conservatory at that place, has been selected as Mr. O. THOMAS'S successor.

A LARGE MUSHROOM.—A very fine Mushroom, of gigantic size, was picked up in Londesborough Park by a workman. Dimensions—42 inches circumference, 13½ inches diameter, and stem 6 inches round. Weight, 2 lb. 0½ oz.

DEODAR CONING.—Reverting to this subject, we may note that the earliest record we can find of the Deodar coning in Europe is of one that fruited in 1852, at Mr. KELL BARCLAY'S, at Bury Hill, near Dorking, as recorded in our columns, September 11, 1852, p. 582. The tree was at that time 28 feet high. We should be glad to know its further history. Since then it has fruited at Dropmore, Kew, Sunninghill, and other places. Sir JOSEPH HOOKER kindly reminds us that at Kew there is a specimen tree which was a seedling raised by the late Sir THOMAS ACLAND from a cone produced at Killerton, near Exeter. The tree is more vigorous than many of the other Deodars grown at Kew, the species not thriving well in the Royal Gardens. Writing from Bicton in our columns in December 11, 1869, Mr. JAMES BARNES, says:—"I have not yet seen a tree above fifty years old, or more than 80 feet high, though I have known it to produce cones for years; and have seen perfect seed produced from home-grown plants, as well as plants raised from home-grown seed."

THE RHUBARB IN GERMANY.—A daily contemporary points out that the Rhubarb plant is likely to come into high favour on the Continent. It is no stranger in Germany nor in Switzerland; but hitherto it has been almost wholly confined to two uses—medicine and ornamentation. The size of its leaves has made it popular as a garden plant, but the English have been greatly pitted for valuing it as a substitute for fruit. The grievous failure of the fruit crop this year in central and southern Germany has converted the *Landwirthschaftliche Korrespondenz* to the opinion that the English have shown their usual practical sense in making so much of this vegetable. It recommends all families to cultivate it, gives directions for its management, and adds receipts for making Rhubarb preserve and Rhubarb wine. The latter, it says, is a far more delicate dessert-wine than can be made from any berry, and second only to the Grape. It anticipates a time when Rhubarb stalks will be as familiar a sight in the fruit markets, and as profitable an article of trade, as they are in England. It specially commends the sort known as "Queen Victoria."

THE GARDENERS' ORPHAN FUND.—What a woman can accomplish in aid of this Fund has been well exemplified by Mrs. BOWERMAN, of Blackwood Park Gardens, who, when the recent Basingstoke flower show was held in the Park, provided tea for gardeners and other visitors, and handed over the proceeds to the Orphan Fund. The weather was very wet, and most distressing for a flower show, but in spite of this difficulty, Mrs. BOWERMAN, with the kindly aid of Master HOARE, netted the sum of £2 16s., which has been forwarded to Mr. BARRON. We regret to learn that Mr. BOWERMAN is still in King's College Hospital in a condition which creates much anxiety.

STRAWBERRIES.—Fifty acres of Strawberry plants in one field alone, as shown in our recent illustration at p. 223, seems to those even familiar with fruit culture almost a staggerer. Those who would doubt should go into Kent and see for themselves, especially in the gathering time. What interesting statistics could an industrious calculator produce from out of this 50-acre breadth. How many rows of plants, how many in a row, how many per acre, and finally over the entire area? How many pounds, hundredweights, and tons of fruit annually gathered? How much of manure applied, how much the cost of labour, in fact, all sorts of

things might be added up and counted, which, though seemingly trivial, yet have great importance in Strawberry culture? How these Kentish growers fly in the face of correct teaching by sending in horse-hoes to deeply art the soil between the rows, even moulding ploughs to ridge the soil in the winter, and carts laden with manure to dress the plants also liberally. If they do not dig between the rows of plants, it is because the breadths are so large. Such course would be impracticable; to have the soil between the rows of plants well cleaned and pulverised, is one of the great essentials of successful field culture. That, the horse-hoe accomplishes most thoroughly; hand-hoes do the rest. So that, as soon as possible after the fruit is gathered, the plants are cleared of all weeds and refuse, and have ample room and air to enable them to perfect their crowns. The frequent heavy rains have rendered the ordinary routine of culture this season difficult; still, it has been got over, somehow. A breadth of Strawberry plants left all the summer to smother in a bed of weeds would cut a poor figure the following year. Only good culture, with good sorts, on good soil, will pay.

FRUIT SALES IN KENT.—The annual hardy-fruit sales in Kent have just finished, says the *Daily News*, and the results are certainly not satisfactory to growers. Plums and Pears are so plentiful that buyers decline to speculate, except in rare instances, where fancy prices were obtained. Profiting by the bitter experience of last year, when, after good prices had been accepted, the Plum crop proved a failure, buyers were exceedingly chary, and the competition was decidedly slow. Pears were similarly treated. In one case a reserve of £100 had been placed on a certain lot of William's Pears, but the highest bid only reached £56. Other nice lots of fruit shared the same fate, and, consequently, growers will be obliged to market the fruit themselves, or accept greatly reduced offers. With harvest in full swing, and the hop-picking season imminent, growers prefer to sell their hard fruit on the trees, but in this respect many of them will be disappointed. On all hands it is admitted that Plums will be very prolific, and consequently this favourite fruit should be within easy reach of the poorest classes. The jam-manufacturers in Kent—of whom there are now several—are buying up large quantities of Plums. One firm of jam-makers, who are also extensive growers, are so well off for Plums, that they have no need to buy elsewhere. One of the common sorts of Pears is also very plentiful. This special kind of fruit has been sold in the London market at the rate of a shilling for the half-sieve. After paying the carriage of the fruit, and deducting the salesman's commission, this leaves 5d. for the grower, out of which he has to pay for the picking and other incidental expenses, thus bringing the net profit down to a very low minimum. A case of one buyer is reported, in which he is said to be so disgusted at this price, that he is feeding his pigs off the Pears.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—At the Floral Committee meeting of August 8, 1891, the committee awarded First-class Certificates:—To Mr. D. Bas Backer, Jr., Apeldoorn, for Collection of *Begonia tuberosa erecta*, fl.-pl.; to Messrs. De Graaff Brothers, Leiden, for *Babiana tubiflora* Gawl. (insufficiently-known plant); *Tritonia scillaridis* (insufficiently known plant); *Watsonia aletroides*, Gawl. (insufficiently-known plant); *W. humilis*, Mill. var. *rosea* (insufficiently-known plant); to Messrs. Groeneweg & Co., Amsterdam, for Collection of *Tydaea hybrida*; to Messrs. E. H. Krelage & Son, Haarlem, for *Asclepias Fremontii* Torr. (insufficiently-known plant), *A. tuberosa* L. var. *sulphurea* (insufficiently-known plant), *Eremurus Olge Rgl.* var. *angustifolius* Hort. Petrop. (new plant), *Eucomis bicolor*, Baker, var. *robusta* (new plant), *Gladiolus purpureo-auratus*, J. D. Hook, var. *Admiration* (1888) (new plant), G. p.-a. J. D. Hook, var. *E. V. Hullock* (1889) (new plant), G. p.-a. J. D. Hook, var. *Gil Blas* (1890) (new plant), G. p.-a. J. D. Hook, var. *Gipsy* (1889) (new plant), G. p.-a. J. D. Hook, var. *Hippolyte* (new plant), G. p.-a. J. D.

Hook, var. *Rembrandt* (Hort. *Krelagei*, 1887) (new plant), G. p.-a. hybr. (No. 112) var. *Monsieur Dros* (Hort. *Krelagei*, 1891) (new plant), G. p.-a. hybr. (No. 125) var. *Géant de Haarlem* (Hort. *Krelagei*, 1891) (new plant), G. p.-a. hybr. (No. 132) var. *Jacob Maris* (Hort. *Krelagei*, 1891) (new plant), G. p.-a. hybr. (No. 133) var. *Hugo de Vriea* (Hort. *Krelagei*, 1891) (new plant), G. p.-a. hybr. (No. 134) var. *Joseph Israëls* (Hort. *Krelagei*, 1891) (new plant), *Montbretia crocosmiiflora* Hort. var. *Talisman* (new plant), M. c. Hort. var. *Tigrisidie* (new plant); to Mr. C. G. Van Tubergen Jr., Haarlem, for *Calochortus madrensis* Wats. (new plant), *Eremus Olge Rgl.* (insufficiently-known plant), *Gladiolus Saundersii*, Bkr., × *gandavensis* Hort. var. *L. Spohr* (new plant), G. S. B. × G. Hort. var. *R. Wagner* (new plant), *Lilium nepalense* var. *ochroleucum* (insufficiently-known plant), *Roscoeia akkimensis* (insufficiently-known plant).

Second-class Certificates:—To Messrs. De Graaff Brothers, Leiden, for *Gladiolus galeatus* Andr. (insufficiently-known plant), *Watsonia Meriana* Mill. (insufficiently-known plant); to Messrs. E. H. Krelage & Son, Haarlem, for *Eucomis bicolor*, Baker (insufficiently-known plant), *E. b.*, Baker, var. *maculata* (new plant); *Gladiolus purpureo-auratus*, J. D. Hook, var. *Beaurepaire* (1889), (new plant); G. p.-a. J. D. Hook, var. *Hooft* (Hort. *Krelagei*, 1887), (new plant); G. p.-a. J. D. Hook, var. *Minister von Lucius* (1889), (new plant); G. p.-a. hybr. (No. 7), var. *Arentine Arendsen* (Hort. *Krelagei*, 1891), (new plant). To Mr. C. G. Van Tubergen, jun., Haarlem, for *Gladiolus Saundersii* Bkr. × *gandavensis* Hort. var. *G. F. Handel* (new plant); G. S. Bkr. × G. Hort. var. *L. Van Beethoven* (new plant).

Botanical Certificates:—To Messrs. E. H. Krelage & Son, Haarlem, and to Messrs. De Graaff Bros., Leiden, for *Allium cyanum*, Regel (new plant).

Honourable notices:—To Messrs. E. H. Krelage & Son, Haarlem, for *Eucomis undulata*, Ait.; Messrs. Ant. Roozen & Son, Overvee, for *Griffithia hyacinthina*, Herb. Votes of thanks:—To Messrs. J. T. Van Den Berg, Jr., Jutfaas, for *Gladiolus Lemoiniei* Hort. var. *Derviche* (new plant); G. L. Hort. var. *Eiffel* (new plant); G. L. Hort. var. *M. Forcy Yannier* (new plant); G. L. Hort. var. *Oriflamme* (new plant); G. L. Hort. var. *Rabis* (new plant); to Messrs. E. H. Krelage & Son, Haarlem, for *Agapanthus umbellatus* Ait. var. *fol. aureo-vittatus*, *Bomarea oligantha*, Baker (insufficiently-known plant); *Bowiea volubilis*, Harvey (insufficiently-known plant); *Lilium Wittei*, Suringar (insufficiently-known plant); collection of *Lathyrus* in forty-three species and varieties; collection of *Montbretia* in eighteen species and varieties; collection of *Tigridia* in eleven species and varieties; *Zygadenus elegans*, Pursh. (insufficiently-known plant). To Mr. A. Rietveld Utrecht, for *Begonia semperflorens* Vernon, to Mr. C. G. Van Tubergen, Jun., at Haarlem, for Collection of *Achimenes* and *Tydaea*.

First-class Certificate:—To Mr. G. Doeve, Leiden, for Seedling Peach "Vroege Van Cronstein" (Early Cronstein). Amsterdam, August, 1891, H. C. ZWART, Secretary.

GATESHEAD HORTICULTURAL SOCIETY.—The thirty-sixth Annual Show of the above was to have been held on September 1 and 2, in Saltwell Park, but a severe gale blew down the tents, making it impossible to hold the same in its entirety. The show of cut-flowers, fruit, and vegetables only was held in a small tent, and that under circumstances of much difficulty. For the secretary and committee, who have worked so hard to make this a financial success, much sympathy is expressed.

DECAY OF PEACHES ON THE TREE.—A correspondent—a Frenchman—states, in very bad English, that the decay of Peaches whilst on the tree is due to the heat of the sun "boiling" the juices within the stone, and of necessity those contained in the surrounding pulp. It is a very odd idea, and the way of combating the evil hardly less so, which is, he says, very easy when you know it; that is, to hang a thin shading before the trees, and

4 feet away from them, between the hours of 10 A.M. and 3 P.M., and when the warmth of the wall is between 80° and 90°, and to afford the shading materials a thorough wetting by means of the syringe if 100° is reached. He says that shadings do not affect the proper colouring of the fruits. Have any of our readers experience of this method of saving their Peaches?

LOW TEMPERATURE IN WARWICKSHIRE.—On Saturday night, August 29, Mr. T. WOODFORD of Atherstone, informs us that the thermometer fell to 34°; and the weather was very wet and stormy. During the month of August, 4 inches of rain had fallen at that place.

FLOWERS IN SEASON.—Some very good Carnations and Picotees have reached us from our Birmingham correspondent, Mr. W. DEAN, Sparkhill. Two are seedlings raised by Mr. HERRERT, the manager of Messrs. THOMSON'S nursery, viz., Carnations Blushing Bride, a French white, full, with a good calyx; and A. W. Jones, a crimson-flake—a pleasing flower. Some Picotees of Mr. J. DOUGLAS' raising were Lillian, red-edged; Almira, yellow ground, rose edged; and Terra Cotta, a fancy Carnation. Several new Carnations of Mr. BENARY'S raising accompany these, viz., Sarony Unger, a purple bizarre; Stadtrath Boel, a scarlet flake; and Frederick Alexander, a purple bizarre. Two older varieties—Nellie, a light red-edged Picotee, with fine fragrance, and Companion, a heavy rose-edged, were likewise sent.

"MONOGRAPHIA PHANEROGAMARUM."—We have just received the seventh volume of this work, which is the continuation, and, in part, the revision of the famous *Prodromus*, and, like it, indispensable to botanists. The volume is devoted to a monograph of the Melastomaceae, by M. ALFRED COENIAUX. The number of species enumerated is no fewer than 2730, the greater number tropical American. The monograph appears to be produced with equal care and elaboration. As, apart from its botanical interest, many of the species are among our most ornamental stove plants, we shall take another opportunity of advertizing to what undoubtedly is one of the most noteworthy productions of the kind.

CHISWICK NOTES.—Some beds of *Hydrangea paniculata grandiflora* are just now very noticeable in the Royal Horticultural Society's Gardens. With its great pyramidal panicles, 1 foot in depth, and 2 feet in circumference, crowded with large white flowers, it is highly ornamental, and is undoubtedly one of the finest of hardy deciduous shrubs. A dwarf form of *Mimulus moschatus* (of continental origin), and of very dwarf habit of growth, combined with great freedom of flowering, may be noted as a useful plant for edging beds. Dabbias in the various sections show fancy, single, decorative, and Cactus; and the latest addition to these useful autumn flowers—the Tom Thumb section—will soon give a glow of colour, and produce features of beauty, effectiveness, and interest in the borders. *Fuchsia Danrobin* Bedder is a dwarf and beautiful form of the old *F. Riccartoni*, characterised by its profuse floweriug—a most useful and effective bedding subject. A very interesting and somewhat extensive trial of outdoor Tomatos is being made this season, and the plants on trial are bearing very freely. It is to be feared, however, that the cool weather will not permit of the fruits ripening.

THE BRITISH ASSOCIATION.—The President, Mr. FRANCIS DARWIN, M.A. (in Sect. D., Biological Section), delivered an address on "Growth-curvature in Plants." The scope of the address is indicated in the opening sentences: "A seedling plant, such as a young Sunflower, when growing in a state of Nature, grows straight up towards the open sky, while its main root grows straight down towards the centre of the earth. When it is artificially displaced, for instance, by laying the flower-pot on its side, both root and stem execute certain curvatures by which

they reach the vertical once more. Curvature, such as these, whether executed in relation to light, gravitation, or other influences may be grouped together as growth-curvatures, and is with the history of our knowledge on this subject that I shall be occupied to-day. I shall principally deal with geotropic curvatures, or those executed in relation to gravitation, but the phenomena in question form a natural group, and it will be necessary to refer to heliotropism and, indeed, to other growth-curvatures. The history of the subject divides into two branches, which it will be convenient to study separately. When a displaced apogeotropic organ curves so as to become once more vertical, two distinct questions arise,

his continued belief in the views put forward in the *Power of Movement in Plants*, that circumnutation is a widely-spread phenomenon, even though it may not be so widely-spread as he and his father had supposed. In conclusion he said:—"The relation between rectipetality and circumnutation may be exemplified by an illustration which I have sometimes made use of in lecturing on this point. A skilful bicycle-rider runs very straight; the deviations from the desired course are comparatively small; whereas a beginner 'wobbles' or deviates much. But the deviations are of the same nature; both are symptoms of the regulating power of the rider. We may carry the

to order and made subservient to rectilinear growth. Circumnutation would be the outward and visible sign of the process. I feel that some apology is due from me to my hearers for the introduction of so much speculative matter. It may, however, have one good result, for it shows how difficult is the problem of growth-curvature, and how much room there still is for work in this field of research."

HARPENDEN HORTICULTURAL SOCIETY.—The thirteenth annual exhibition was held in Rothamsted Park on August 26. There were about 800 entries. The special feature was the large collection of herbaceous plants, annual and perennial;

FIG. 35.—VIEW IN DALKEITH GARDEN, WITH GARDENER'S HOUSE IN THE DISTANCE. (SEE P. 278)

which may be briefly expressed thus:—(1) How does the plant recognise the vertical line; how does it know where the centre of the earth is? (2) In what way are the curvatures which bring it into the vertical line executed? The first is a question of irritability, the second of the mechanism of movement. Sachs has well pointed out that these two very different questions have been confused together. They should be kept as distinct as the kindred questions how, by what nervous apparatus, does an animal perceive changes in the external world; and how, by what muscular machinery, does it move in relation to such changes? The president dealt separately with "irritability" and "mechanism," and then treated of "circumnutation," expressing

analogy one step further: just as growth-curvature is the continuance or exaggeration of a nutation in a definite direction, so when the rider curves in his course he does so by wilful exaggeration of a 'wobble.' It may be said that circumnutation is here reduced to the rank of an accidental deviation from a right line. But this does not seem necessarily the case. A bicycle cannot be ridden at all unless it can 'wobble,' as every rider knows who has allowed his wheel to run into a frozen rut. In the same way it is possible that some degree of circumnutation is correlated with growth in the manner suggested above, owing to the need of regular pauses in growth. Rectipetality would thus be a power by which irregularities, inherent in growth are reduced

Roses, Dahlias, and Stove and Greenhouse plants, made up an attractive and successful show.

NOTICES OF BOOKS.

GRAPE GROWING FOR AMATEURS. By E. Molyneux. (L. Upcott Gill, 170, Strand, W.C.)

It might be supposed that nothing new was left to be said on the subject of Grape-growing in this country. In the above well-written little work, by an excellent gardener and champion Chrysanthemum grower, we have related the cultivation of the Vine in all its varieties. The writer begins at the

beginning, and insists on the careful making of the border, truly observing that on this, the first operation, depends the future success of the Grape-cultivator. The directions for border construction, and generally, are stated in plain language, tolerably free from technical phraseology, as befits a book intended for the amateur, and they are about as good as any that we have seen. The chapter on vineries is a useful one; and that dealing with the propagation of the Vine will be of great service to those who are usually not too well provided with suitable appliances.

The sub-division of the seasons' culture, of the Vine into early, late, Muscat, vinery, and greenhouse treatment, is particularly happy. The subjects of dealing with the shoots during growth, thinning the bunches, with examples (not enough) of unthinned and thinned, properly and improperly, are treated at considerable length. Shankling is dealt with as usual—that is, unsatisfactorily, guesses, more or less near the truth, as to its cause being made. Over-cropping is the commoner cause given; but how is it that, however much a plant in a vineyard may carry, and it will carry as much as twenty-five pounds weight, the next year's crop does not shank? We have yet much to learn as to the causes of this disorder in glasshouse Grapes. A descriptive list of varieties is given, together with their various merits, faults, and uses, and this chapter is supplemented by one on the peculiarities of certain varieties.

The chapter on pruning would have been better understood had there been more illustrations.

PLACES OF INTEREST GOING NORTH.

Messrs. W. Fell & Co., Hexham.—Among the many persons whose interests or fancies will take them northward to the Edinburgh Exhibition, will doubtless be found some to whom forestry in some of its phases, as practised in this country, will appeal strongly. Those of our readers residing in cold or exposed localities, or who intend planting in such aspects, know the value of clean, healthy stocks of timber trees, and the advantages which are derived by planting such as have been raised in cold exposed nurseries, yet in good soil, should not fail to visit the nurseries of W. Fell & Co., Hexham, Northumberland. The firm has rapidly become famous, by reason of its Whinham's Industry Gooseberry, and is fast becoming widely known as among the foremost possessors of the hardiest forest stuff to be met with in England. The town nursery is close to the Hexham station of the Carlisle and Newcastle Railway, and it is here that the few plant-houses are found, as well as ornamental park and garden trees, acres of the celebrated Gooseberry above named, and the finest collection of herbaceous plants to be found in the North of England. The rest of the nursery is to be found in isolated patches of many acres in extent on the hills that skirt the town on the south, and these fields, being entirely on the northern face or on the top, are fully exposed to the colder winds, and the subjects they are planted with endure all the rigours of none too gentle climate. Here were noted enormous quantities of Larch, Scots Pine, *Pinus austriaca*, *Abies septentrionalis*, a variety of Spruce likely to take the place of the common Spruce in the future. It is sparse of habit and a deep rooter, which the latter is not, as planters have often learnt to their cost. Great numbers of *Abies Menziesii* are being grown, as it is believed that it will take the place of *A. Douglasii*, a species that does not do well everywhere. *A. Menziesii* makes as good timber, and is moreover an even more rapid grower. Much of the coniferous stuff is of planting age, vigorous, stocky, and well-rooted, and which may be accounted for by the annual or biennial transplantation to which all the stock, of whatever description it may be, is subjected. Some of the Scots Pine—that which came, we believe, from primitive forests at Braemar, and which is kept separate from other stock—is of a lively green, instead of blue-green, the commoner tint of this species of Pine.

Beyond the colour difference, no other point seems to distinguish this from the common one. On the high ground, large breadths of deciduous timber trees are raised, as Ash, *Populus canadensis*, a fine street tree, and one that has been so employed at Glasgow; Sycamore, &c. The Larch seemed to us to look particularly happy, as did also the Quicks, of which very large quantities are grown for railway supply particularly. This plant is sometimes a sufferer from mildew, but this season, so peculiarly favourable to mildew attacks, it has not appreciably affected the Hexham stock of the plant. Of ornamental Conifers in the town nursery, mention should be made of the very fine lot of *Cupressus Lawsoniana*. A golden variegated Weeping Ash, was remarked, whose variegation is very fine, and constant. Of the Whinham Gooseberry the available stock is about 400,000 in one, two, and three-year-old plants. The astonishing quantity of fruit gathered from this variety and its earliness are fast making it the Gooseberry for market purposes, and especially for gathering in the green state, as there is a clear gain of three weeks over any other known Gooseberry. A Hexham fruit-grower is stated to have picked from $3\frac{1}{2}$ acres of bushes 26 tons of fruit, realising a gross sum of £280. The fruit of a dark, dusky-red colour when ripe, and of fairly good quality.

The herbaceous perennials and dwarf-growing shrubs form very complete collections of such species and varieties as are found to succeed in the North. We noted among little-known things, *Helenium doricoides*, very free-flowering; a double-flowered Sweet William, only 4 inches, of a rich velvety crimson, coming in September with heads as dense as a Cockscomb; Carnation Raby Castle, raised by Mr. Westcott, of Raby Castle Gardens, with fine salmon-pink flowers, very free and robust; *Heli-anthus rigidus*, about 5000 fine healthy plants; *Saponaria officinalis*, good for spring and autumn display, flowers lilac-coloured; *Pyrethrum White-Queen*, like *P. parthenifolium*, but better, with white, button-like blooms, and excellent for cutting; *Aster alpinus altaicus*, 6 inches in height, with purplish-lilac flowers—a free and continuous bloomer; *Spiraea Nobleana*, an improvement on *S. Douglasii*, having a large corymb of rose-pink blooms; *S. opulifolia aurea*, a good plant for smoky towns—it has yellow leafage; *Genista tinctoria* is a species with bright yellow blossoms, and it is full of flower at the present time; *Cornus sibirica argentea elegantissima*—Heaven save the name!—is a much better subject to plant than *C. s. elegantissima*, the variegation being far clearer. A selection from the English Bramble was observed, which is going to be put under the treatment usually accorded the Raspberry; it has a dwarf habit, and it fruits freely. The New Zealand species of *Veronicas* were found in large numbers, but all much mutilated by frost, with the one exception of *V. Traversii*, which is undoubtedly the best for the rough North. The bushes of *Viburnum Lantana* were observed to be full of berries; this is one of the hardiest of shrubs, and pretty either in flower or berry. *Daphne Cneorum*, *Hippophae rhamnoides*, and Ploughman's Spikenard, *Inula Conyza*, were observed in good condition. The latter gets cut down in some winters. Large numbers of fruit trees, of kinds suitable for the district, are grown, and the crops of Messrs. and Green Chisel Pears were enormous. This is a most interesting nursery, and a fact may be mentioned that will be well understood and appreciated by all planters, that there was an entire absence of old stock.

ALNWICK CASTLE.

The gardens at Alnwick Castle, the best in the county of Northumberland for fruit growing under glass, and a certain style of bedding-out pursued there, that is well adapted for the cool climate, should not be omitted from the list of places worthy of being visited by gardeners going North. The place is best reached from Bilton Junction of the North-eastern Railway, and is distant from the station of Alnwick about a quarter

of a mile. As befits a modern garden and its glass erections, it is removed some distance from the hoary old stronghold of Alnwick Castle, whose flagstaff on the keep is about all that one can see of it from the area round the glasshouses. The arrangement of these glass-houses in groups running east and west, with a flower garden around them, the beds being on turf, and of simple form, is worthy of imitation in such places as demand it for the sake of avoiding incongruousness. One cannot say too much for the fine style of keeping the beauty of the turf and walks, and the general air of tidiness and cleanliness prevailing, not only in this part of the garden, but everywhere else. Peach trees are well grown, and have been by Mr. Harris put into perfectly healthy condition as regards soil and drainage of the borders, &c. In one of the first Peach-houses entered were found two trees, each seventy years old; these were the old Galande and Royal Hâtive, and another tree of the same great age yields fine crops every year of pale-coloured fruits—its name was not learned. The great age of these trees is very evident, from their enormous stems and rugged main branches, but one would scarcely have expected to find so much excellent young wood in them as was the case. One of the best of all late Peaches—Princess of Wales, was observed in the next house entered; it was also in fine bearing, the crop being, of course, not yet ripe. A tree of *Violette Hâtive* in the same house was a good companion to the former. We entered three of the iron-ribbed vineries, of an old-fashioned style of workmanship, in which there were splendid crops of Black Hamburgh, Alicante, Mrs. Pince, Muscat, &c. It was remarked that Mrs. Pince, a notoriously shy setter, was hung all over with perfect bunches—a result which has followed artificial fertilisation. The other Grapes were excellent, good bunches, high finish, and large, hard foliage; the youth of the Vines is renewed by the method of cutting out the old, and laying in new wood. One of the vineries planted with Muscat of Alexandria had its Vines lifted in the autumn of 1890, and in another the Vines had not been transplanted. The untransplanted Vines carried a very fine lot of large bunches, and the Vines in the other house, which had not had its crop sacrificed in any way, because of having been removed, bore a crop that was but little behind it in the size of the bunches and the berries. Pines have always been well managed at Alnwick, and fine fruits, ripe, and approaching ripeness, were noticed; these were mostly Queens. The winter varieties consist of Charlotte Rothschild and Smooth Cayenne; the majority are of the latter variety, and a few Black Jamaicas. The Pine stoves are not quite all that a gardener could wish, most of them being too lofty; and then the iron construction and small panes of glass tend to make artificial heat in excessive amount a necessity in cold weather. The handsome conservatory was gay with plants in bloom, and in it were noticed a magnificent *Luculia gratissima*, which Mr. Harris said is pruned in February, and the shoots never stopped, and it flowers beautifully in its season. A large *Bougainvillea glabra*, yellow Abutilon, and an immense specimen of *Fuchsia Carolina* were noted on the roof and its supporting pillars. The wall trees are really fine examples of what good soil and management, with careful summer treatment of the young wood, and clever training can do in not the best of climates. Plums and Pears and Morello Cherries were heavily laden, as were most of the Apricot and Peach trees. A Noblesse Peach, planted so long ago as 1828, was full of nice fruits. A good many useful species of Orchids are grown, amongst them a grand piece of *Cymbidium Lowianum*. The stock of Ferns and other plants used in the decoration of apartments is a very large one, as is the number of plants of *Eucharis amazonica*, which it may be remarked are in fine condition. There are other plant-houses than those containing the plants mentioned above.

Dwarf Apples on the paradise stock are planted at the sides of the vegetable quarters, and the varieties

which almost invariably crop well are Ecklinville, Lane's Prince Albert, Bismarck, Red Calville, a famous dark crimson, and very prolific early fruit; The Queen, Manx Codling, Grenadier, and Lord Suffield. These are varieties which are found as well suited to the climate as the old Cockpit and Fulwood, once thought to be indispensable in that part.

HOME CORRESPONDENCE.

THE "NEWER AND LITTLE KNOWN STRAW-BERRIES.—The following notes may be of interest to some of your readers. The past Strawberry season

Nicaise—not established enough to test—is a great bearer; Brown's Goliath is an enormous bearer, but it is quite flavourless; Commander, a market fruit, being promising; Competitor, whose early flowers got frozen, has large fruits of good flavour, robust grower, promising; Georges Lesirer, is a very fine late large sort; Harris' A1, was spoilt by the rain—a bearer; John Ruskin, a remarkably early, but destitute of good flavour; Latest of All, a very large and fine fruit, a grand novelty; Prince Tick, instead of being better than Paxton, it is inferior to it; Sharpless' No. 1, very large and early, a good market sort; Souvenir de Kieff, a large heavy late variety of refreshing and fine flavour; Unser Fritz, large, and of fine flavour, a late variety; Victory House, same as Brown's Goliath. Among the older kinds Elton Pine, Dr. Hogg, Countess and

season. Very few blanks occurred in the quarters. I think White Knight will be good in a dry season; it is very pretty in the dish. *George Bunyard, Maidstone.*

GARDENERS' ORPHAN FUND SUGGESTIONS.—In noting in your last issue the splendid receipts at the late great show at Srewsbury, a thought occurred to me. I notice that this spirited Society has done much good with its surplus in the past. A really grand opportunity presents itself now to the Society for recognising the claims of this most deserving charity. As is now well known, the fund has a large number of orphans to maintain, and the unavoidable abandonment of the Covent Garden *site*, a good source of annual revenue, has compelled the executive to seek for the much-needed support in fresh

FIG. 36.—NEWBATTLE ABBEY. (SEE P. 278.)

has given us a great quantity of fruit, but owing to the continued wet, much of it has been inferior in quality, and the small or sparse-foliaged kinds have done better than those having an abundant leaf growth, as the former did not root so much; and the smooth, shiny kinds as Vicomtesse Héricart du Thury, Lucas, Victoria, &c., have naturally come out best. President, Sir J. Paxton, Sir C. Napier, and others like them, very much spoiled; in fact, such strong sorts should be quite 4 feet between the rows. To take my notes alphabetically, I find Albert very large, globular, and of fine Hautbois flavour; Aberdeen Favourite, a very free bearer, shiny red, and although a strong grower, it has done well—it is rather late; A. F. Barron will, I think, be a good market Strawberry; Auguste

Filbert Pine have been very good. As far as earliness is concerned in the open, the frost of Whit-Sunday cut all the King flowers, and they came in together—King of Earlies, Alice Maude, Hooper's Seedling, Noble, Grosse Sucrée (very fine this year), and Viscomtesse H. de Thury being in the earliest pickings; as usual, the new beds were a week the earliest. Those who are making new beds cannot take too much pains to manure the land freely and to cultivate deeply, the quarters so prepared show the generous treatment until the last. Waterloo has been extra fine, and proves a good wet weather berry. Monsieur Tournier is quite distinct, and not such a good bearer. We consider the long frost and snow gave the Strawberries a rest, and they never started more freely, and looked better than in the past

quarters. Other horticultural societies with a surplus this season should come to the rescue also, and that without delay. One or two other ideas suggest themselves in connection with eliciting aid for this charity. For some unexplained reason, the Fund has not hitherto derived much support from Scotland. Now our Scotch brethren of the craft have a grand opportunity for making amends for their apparent lukewarmness—and that soon. On the occasion of the forthcoming International Fruit and Flower Show in Edinburgh on September 9, 10, and 11, let the powers that be organise themselves into a collecting committee in aid of the Fund, by scattering boxes about the show, and advocating its claims upon the charitable in every possible way. The various gardeners' mutual improvement associations will soon

be commencing their sessions. Would it not be a good plan to have a collecting-box on the table at each meeting, so that those who felt so inclined to afford a small sum might do so. *J. B.*

IS HYDRANGEA PANICULATA A HARDY PLANT?—At a flower show recently held at Bridgewater, there was a class for "eighteen bunches of hardy perennial and bulbous plants," and the judges disqualified one stand containing a bunch of *Hydrangea paniculata*, it is stated, on the grounds that it was not a perennial, and not hardy. I think they were quite right in objecting to *Hydrangea paniculata*, on the ground that it is not what is generally accepted as a perennial, it being very properly classed in catalogues with hardy shrubs, and not with hardy perennials. But as *H. paniculata* finds a place in lists of hardy shrubs—that of Messrs. Veitch & Sons, for instance—I do not think it should have been objected to on the ground it is not hardy. Indeed, Mr. George Nicholson, of Kew, a trusted authority, holds this species to be hardier than *H. hortensis*, which other good authorities hold to be by no means hardy, except at or near the sea-side, and as requiring some protection during winter, where the conditions of climate are not favourable. But it is further stated, the judges somewhat complicated matters by accepting *H. hortensis* and *H. otaksa* as admissible; at any rate, they were not objected to. *E. W.*

NEW GRAPES.—Being in the neighbourhood of Appley Towers, Isle of Wight, on August 1, I called to see these new *protégés* of Mr. Myles, viz., Appley Towers, black—and Lady Hutt, white, which have already gained First-class Certificates from the Royal Horticultural Society, as new and distinct kinds, and likely to prove standard late varieties, especially in the hands of good Grape growers. It cannot be said they have any special treatment at Appley Towers, for they are grown in a mixed house, inarched on to indifferent stocks, which had hitherto failed to give satisfactory Grapes. The canes thus made were afterwards bent down and layered on to the surface of the border. The bunches are not extraordinarily large; but the size and shape of the berries are so prominent as to at once arrest the attention of the most casual observer, unless the unusually bad weather all through August has prevented or hindered the ripening process. I understood it is Mr. Myles' intention to submit them for public criticism before the International Fruit Exhibition at Edinburgh on September 9, 10, 11, when gardeners and others interested may inspect them. It would be unfair to expect to find such late kinds in best condition so early in September unless specially forced for that early date, and which, I understand, these have not been. Nevertheless, I am of opinion sufficient merit will show itself, under such adverse circumstances to justify the exhibit. The origin of these splendid Grapes has been before given in the columns of the *Gardeners' Chronicle*. Mr. Myles has, I observed, planted entire houses of each kind, and judging from appearances, even better results may confidently be expected next year; moreover, he has also worked up a large stock of strong planting canes, in readiness for commercial purposes. *W. Crump, Madresfield Court, Malvern.*

"SIMPLES."—An old subscriber begs the favour of the name of a herb which she has had sent to her, from Derbyshire, where it seems to be much used by villagers for curing lumbago, as it acts favourably on the liver, &c. It grows in arable fields and other places, but is not a rock plant, so far as she can ascertain. Some people called it Pellitory, but this does not resemble Pellitory of the wall in any way. It is most successful in removing lumbago—2 oz. of the herb with a pint of boiling water poured over it, and left till it is cold, a wineglassful being taken twice a day, fasting. *Leamington.* [The plant sent was *Alchemilla arvensis*, and given faith would no doubt be proportionately useful. *Ed.*]

FERN NOMENCLATURE.—Your correspondent Mr. W. Napper (p. 246), is not the only lover of Ferns who has been perplexed by the confusion in their nomenclature. As far as the genera are concerned, it would be an excellent plan if those of the *Synopsis Filicum* were adopted, raising the sub-genera to the rank of genera. But as regards species, the question is infinitely more complicated. Here, in many groups, an entire revision is required, and a double arrangement will be necessary—a botanical and a horticultural. For instance, *Lomaria procerca*, a Fern of soft, herbaceous texture, is as different as possible in a gardener's eye to the cast-iron-looking *Lomaria chilensis*; yet there are connecting forms, and both are held by Mr. J. G. Baker to be varieties

of the former species. So again with *Hypolepis distans*, and several other species of this genus, which cannot be satisfactorily separated from *Polypodium* (*Phegopteris*) *punctatum*, though in the *Synopsis* the first-named genus is placed in the one great division of *Involucratae* (sori furnished with an involucre), and the second in the other division of *Exinvolucratae* (sori without an involucre), and they are separated by four tribes, and heaven knows how many genera from each other! On asking Mr. Baker to which genus *Phegopteris punctata* ought to be referred, *Hypolepis* or *Phegopteris*, he replied, "Both!" And no doubt he was right, for some of its forms approach nearer to one, and others to the other genus. *Alfred O. Walker.*

DINARD.—This pretty French watering place, with its lovely deeply-indented coast-line, offers many attractions to the horticulturist. The climate seems very mild, and numbers of the half-hardy and tender shrubs and plants can be grown; this fact has been largely taken advantage of by English villa owners, of whom there is a numerous colony. The Bamboos particularly seem to flourish near the sea; in fact, quite rival the Tamarisk. Fruit-culture can be carried on here under most favourable auspices, and I never remember to have seen such an un-failing crop of Pears as there is in every garden and orchard one sees. The different varieties all attain to an unusual size; this is best exemplified by the huge specimens of Williams and Beurré d'Amanlis, now exhibited in the fruiterers' windows. The Golf course at St. Briac will be soon one of the best in Europe, it runs parallel with a bold coast-line, and is a rare hunting ground for wild flowers. One often has to play one's ball on a carpet of Autumn Squills. In fact, the ground is as thick with the Squills as an English meadow with Buttercups. In the dry hollows *Solanum nigrum* grows abundantly, and the *Eupatorium* in those that are damp. *Vagabond.*

SEED PODS ON ORCHIDS.—I enclose herewith two seed pods, half developed, of the *Dendrobium Brymerianum*, with the flowers on them unopened. This is the second time this plant, which is the short-bulbed species, has attempted to flower with me, and on each occasion instead of the flower opening it has shrivelled, and seed pods have developed. It seems difficult to understand how the flower buds could have become fertilised—yet there it is. On the last occasion, I let the seed ripen, being curious to see if they would germinate, but none of them did. Can you explain the cause of this phenomenon? I have tried the plant both in the intermediate and East Indian houses. *Richard S. Bond.* [The flowers are closed and imperfectly developed. At first, we thought it a case of close fertilisation (cleistogamy), but, on examination, we find no trace of pollen. The ovules are not properly developed. The swelling of the ovary, and the formation of imperfect ovules, is not an uncommon result of irritation, unconnected with the action of the pollen. *Ed.*]

NOTES ON SOME VARIETIES OF APPLES.—I was much obliged for the trouble you so kindly took to report on the fungus on the Apple leaves I sent you, and intend to try the remedy you suggest. The curious thing is, that among lully sixty different varieties only two, the Melon Apple and Lord Suffield, are affected. These are in different parts of the orchard, and all the trees of these varieties are affected, the neighbouring trees being free from the fungus. I take it that these two varieties are peculiarly liable to this particular pest, and it might be interesting to know if this proves to be the case in other places. Whilst on the subject of Apples, I may perhaps be permitted to mention, as one who has taken up the cultivation of these fruits experimentally with a great deal of interest, that with my experience thus far of a large number of sorts—more than I should plant again had I, with my now gained experience, to start a'resh—I have found the sub-joined the most satisfactory as regards the combined desiderata of reliability, quality, and beauty in my soil: Eckhville Seedling, a grand fruit; Duchess of Odenburg, most prolific and beautiful; Lord Grosvenor, a splendid codlin; Lord Derby, of immense size, and a good keeper; Peasgood's Nonsuch, worth growing, if only for its size and beauty, but with me it is also an excellent cooking Apple; Warner's King, immense fruit, and of excellent quality; Cox's Orange Pippin, early and abundant, and of exquisite flavour; Blenheim Orange, bears well on young trees if on the paradise; Loddington, very large and handsome; Lane's Prince Albert,

most prolific; Bramley's Seedling, a trustworthy variety; Mère de Ménage, an immense fruit, very handsome and unique in appearance; Landsberger Reinetten, a little known variety, but a beauty. *George Benington.*

CARNATIONS AND PICOTEEES.—Mr. Douglas points out the difficulty in saving seed of the finer sorts in such seasons, especially, as we are having. Some years ago, Mr. J. P. Sharp, when living at Perry Barr, Birmingham, pointed out to me some plants, in 48-pots, removed to a greenhouse when blooming, and impregnated, and he had a good supply of pods of seeds, remarking at the time on the advisability of keeping plants in small pots for seed-bearing purposes. Such a season as this, especially in the Midlands and the North, very little seed will be harvested, I fear. Amateurs should get layering finished at once, so as to have the layers well-rooted early; then the plants can get through the winter in a healthy state. Many delay layering, and ill-rooted plants are the consequence. Mr. Douglas has raised and introduced some very fine varieties, especially yellow ground sorts, and there is a superb variety of his named Lillian, which adds materially to his list of honours. The stock of this very fine variety he sold to Mr. R. Sydenham, who let a few of his Birmingham friends have plants. It is a yellow ground, heavily edged and rayed with very bright scarlet, contrasting so well with the clear bright yellow ground colour, of very fine form, and having a well-formed pod. It is a very beautiful, distinct, and bright variety. *W. D.*

THE VARIEGATED ENGLISH ELM.—Your correspondent, Mr. R. Dean, in your last week's impression, wrote of a fine variegated English Elm at Ealing, and thinks there is reason to believe it to be an accidental seedling. There were two large silver variegated Elms at this place (Thornham Hall, Ealing), one of which was cut down to give the other more room. The one that is left cannot be less than one hundred years old, as it was a large tree when I first knew it, forty-three years ago. I enclose a piece for inspection. There may not be a great many specimens of it in England, but Messrs. J. Veitch & Sons, Royal Exotic Nurseries, Chelsea, have, I believe, a large stock of it. It is very conspicuous amongst Oaks and other green-leaf trees, and is a noble companion to the variegated Acers, &c., especially the *Negundo albo variegata*. The variegation in the Elm is not generally so good in a wet summer as in a dry one. *John Perkins.*

ECKFORD'S SWEET PEAS.—Every gardener knows well the value of a good strain of Sweet Peas, and where there is a large and constant demand for cut flowers, usually prepares two or more sowings from which basketfuls of flowers may frequently be gathered. In Mr. Eckford's novelties we have been favoured with something good and very far ahead of what was at one time thought excellent. Of the whites, Mrs. Sankey might well be termed the queen, for it is a handsome thing. The individual flowers are large, with standards pure white, and borne on strong stalks, and the plant is exceedingly robust. I know of no white to equal it. Lemon Queen is very pretty, and Her Majesty a beautiful pink, with a white eye; Purple Prince, rich purple; Ignea, deep crimson; Countess of Radnor, Gaiety, Orange Prince, Princess of Wales, very peculiar; Primrose, Apple Blossom are all good. Empress of India must not be forgotten, for it is exceedingly pretty, the standards being rosy-pink, and the wings white. These in their separate colours are very useful, and help, not only to beautify the borders, but when planted at intervals they may be kept to their colours better, taking care, should a "rogue" appear, to remove it at once. To give praise where it is due, I am sure there is ample room to congratulate Mr. Eckford on his success. *H. Markham.*

BROADWAY.—To any one who loves Mr. Alfred Parson's pictures, this quaint old English village must be very dear. Most of your readers will now be thinking of holidays; there are few places that offer more attractions to those that love Nature in her quiet moods than this. The cottage gardens are gay and bright with all manner of sweet-smelling flowers, and the linteils and perchways are wreathed with Roses and other creepers. As an additional inducement, I may say how favourite a place it is for Americans. Many of them have taken houses there, and the visitors' book of the "Lygon Arms," the old-fashioned hostel, is full of well-known transatlantic names. One sweet garden, with grass walks

and a long arcade of Roses, and a stone quadrangle with Musk growing up from the crannies, has as yet escaped Mr. Parson's pencil. It is also a paradise of wild flowers, and one hill-side was more vividly painted by Nature than any hill-side I had ever seen. The prevailing flowers were the giant Campanula and the Sunflower-like Elecampane; this latter flower, sacred to "Sweet Helen," by whose kiss Faustus prayed to be made immortal, grows most luxuriantly. A garden of Sunflowers is brilliant indeed; I must leave to the imagination a description of a hill-side clad with them. *Fagobond.*

PHORMIUM TENAX COLENSOL.—Last year this plant threw up two flower-spikes 15 feet high, and bore a full crop of seed, some of which was harvested and sown early in April of this year, the consequence is, that we now have dozens of nice little plants, and fortunate it is, for the late severe winter killed the plant entirely. This variety is one of the best of the family for outdoor use, the glaucous tint of the underneath side of its broad leaves give a nice contrast in colour to the upper side, which have a tendency to a brown tint. The flowers are quite insignificant. As a water-side plant this Phormium is capital. *M.*

VERBASCUMS.—*Verbascum phlomoides* is well worthy of cultivation in herbaceous and shrubby borders, but is not often seen. A few plants of it in a garden near here are very effective at the present time, far more so than any other member of the genus that I have seen. *V. Blattaria*—a somewhat rare native plant—is the nearest approach to the above for showiness, and is by no means to be despised when it can be obtained; *V. thapsus* and *V. nigrum* are only fit for the wild garden, and for naturalising in conspicuous places in woods and parks. They all prefer a limestone or sandy soil, and seed abundantly. *V. thapsus* has lately been mentioned by some writers as a plant not often seen, and likely to be lost; but, judging from its behaviour in this neighbourhood, and also on the limestone hills of Kent, I consider we shall be a very long time before we lose it. *W. H. Divers, Ketton Hall Gardens, Stamford.*

STRAWBERRY WATERLOO—This variety has cropped much better in this neighbourhood the past season than it has previously done; it would be interesting to know if growers in other parts of the country have found any improvement in this respect, and if so, whether it is to be attributed to any peculiarities of the season, or to a recovery of vigour that had been lost through over-propagation. It is one of the finest-looking late Strawberries we have, and is also of excellent flavour if allowed to get thoroughly ripe before it is gathered; but mistakes may easily be made here, as this variety is longer than most kinds of Strawberries in reaching maturity after colouring commences. *W. H. Divers, Ketton Hall Gardens, Stamford.*

DANIELS' "CONTINUITY" CABBAGE LETTUCE.—I sowed a row of this Lettuce in the spring at the same time as Paris Cos, and am very pleased with it. It fully merits the name of Continuity; it came in early and is as good now in the middle of August from the one sowing as it was at first. The Paris Cos and the ordinary Cabbage variety have both bolted long ago, but this does not seem to get any more advanced in that direction at present. It is a brown Lettuce of good flavour, and it grows to a fair size. Ours is a heavy soil, and any Lettuce that shows no disposition to go to seed is an acquisition. The row was thinned, and those that were transplanted at that time have turned out as well as the ones that were left. *W. J. S.*

POTATO DISEASE.—I was much gratified by the universal good account of the Potato crop, and absence of all disease, as reported in the *Gardeners' Chronicle*, up to August 8; but on that day, I noticed some spots on leaves of Potato haulm. I was certain on Monday (10th) that it was the old story. A day or two after I was quite certain—the Myatt's Prolific patch was much infected. To-day I perceive a large patch in the middle of my Gloucestershire kidneys, and leaves spotted all round it; so I can confidently report that the plague has begun. [In too many other places also. Ed]. I do not like the look of my Mona's Pride, but the later Potatos as yet seem very clean. I have not yet heard of the disease in any other garden hereabouts, but I have no doubt the *Gardeners' Chronicle* will have plenty of same report as mine. The prospect of the small

crop of Apples and Pears on the trees is a poor one. Apples and Pears black spotted and falling down, the leaves also of some sorts falling withered to the ground. Of course all attributable to the cold nights. Bees have stopped work altogether, after doing so well for a fortnight. *Salop.*

SOCIETIES.

ROYAL HORTICULTURAL.

FLORAL COMMITTEE AWARDS, Tuesday, August 25.

First-class Certificate.

- To *Hypericum Muscariatum*, from Mr. A. Waterer.
- To *Cupressus Arizona*, from Messrs. J. Veitch & Sons.

Awards of Merit.

- To *Dahlia John Walker*, from Mr. J. Walker.
- To *Gladiolus Thalid*, from Messrs. Kelway & Sons.
- To *Gladiolus Bias*, from Messrs. Kelway & Sons.
- To *Gladiolus James O'Brien*, from Messrs. Kelway & Sons.
- To *Cactus Dahlia Delicata*, from Mr. T. S. Ware.
- To *Border Carnation La Neige*, from Mr. T. S. Ware.
- To *Carnation Mr. C. R. Humbert*, from Messrs. Dicksons Limited.
- To *Cactus Dahlia Kyrerith*, from Messrs. Keynes, Williams & Co.
- To *Cactus Dahlia St. Catherine*, from Messrs. Keynes, Williams & Co.
- To *Cactus Dahlia Baron Schroder*, from Messrs. Keynes, Williams & Co.
- To *Single Dahlia Miss Glasscock*, from Messrs. J. Cheal & Sons.
- To *Cactus Dahlia R. Cannell*, from Messrs. H. Cannell & Sons.
- To *Cactus Dahlia Swanley Castle*, from Messrs. H. Cannell & Sons.
- To *Dahlia Arthur Ocock*, from Mr. A. Rawlings.
- To *Dahlia Mrs. L. Stambidge*, from Mr. A. Rawlings.
- To *Dahlia John Rawlings*, from Mr. A. Rawlings.
- To *Dahlia Mrs. McIntosh*, from Mr. A. Rawlings.

MEALS.

- Silver gilt Flora.*
- To Messrs. Kelway & Sons, for collection of Gladioli.
- Silver Flora*
- To Mr. G. Phippen, for collection of Dahlias.
- Silver Bursian.*
- To Messrs. H. Low & Co., for collection of Lilies.
- To Messrs. Keynes, Williams & Co., for collection of Dahlias.
- To Messrs. J. Cheal & Sons, for collection of Dahlias.

Bronze Bursian

- To Messrs. H. Cannell & Sons, for collection of Dahlias.
- To Messrs. Wallace & Co., for collection of Lilies.
- To Mr. W. H. Divers, for collection of border Carnations.
- To Mr. S. Mortimer, for collection of Dahlias.
- To Mr. J. Quarterman, for collection of Oaks (cut specimens).

ORCHID COMMITTEE AWARDS.

Botanical Certificate.

- To *Zygopetalum grandiflorum*, shown by Messrs. Charlesworth & Shuttleworth.

Cultural Commendation.

- To J. Douglas, gr. to Mrs. Whitbourne, Ilford, for *Cypripedium Lowianum*.

Awards of Merit.

- To *L. elegans Blenheimensis*, shown by T. Statter, Esq., Manchester (gr. R. Johnson).
- To *Cattleya Behrensiana*, shown by F. Sanler & Co.
- To *Sobralia leucantha*, shown by Seeger & Tropp.

BASINGSTOKE.

The Basingstoke Horticultural Society held its annual show at Hackwood Park on Thursday, August 20, near the town, but unfortunately the heavy rain that fell during the afternoon caused a thin attendance of visitors, and the exhibits were likewise not quite so numerous, at least, in the plant classes, as on former occasions.

The principal plant class was one for twelve specimens, in or out of bloom, and in this competition Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood Park, was easily 1st, the high quality of his flowering plants eclipsing all others—a *Cero-dendron fallax* was especially well flowered; Mr. Russell, gr. to Rev. S. Saville, Audley's, Basingstoke, was 2nd.

Mr. T. Weaver, gr. to W. C. Gilchrist, Esq., Oakley Park, Basingstoke, exhibited the best foliage plants in the show—six species, well grown; he also showed a like number of exotic Ferns, in perfect health; Mr. G. Southcott, gr. to Captain Oldfield, South Warnboro', being 2nd in this class.

Mr. Kneller, gr. to U. S. Portal, Esq., Malshanger Park, Basingstoke, was the most successful exhibitor with hardy Ferns, eight species, distinct; and Mr. Tripp, gr. to Mrs. Field, Goldings, Basingstoke, was 2nd.

In the specimen foliage-plant class, Mr. Bowerman staged a well-grown and coloured *Croton Queen Victoria*, and secured the 1st prize; Mr. Weaver depended upon *Cycas revoluta*, and was put 2nd.

Fuchsias formed notable exhibits, Mr. Russell's, which gained premium honours, being finely grown and flowered, from 7 to 8 feet high.

In the class for *Coleus*, all exhibits were pyramidal in shape, Mr. Southcott taking 1st with plants about 6 feet high.

Tuberous *Begonias* were more remarkable for the good quality of their flowers than for the size of the plants. Mr. Norris, gr. to J. Porter, Esq., Kingsclere, was 1st for six.

Table plants were a very superior lot, and Mr. Bowerman just won the 1st prize.

There was but one class for a group of miscellaneous plants, arranged for effect, one of which came from Mr. Weaver; and if it had not won the 1st prize in a large competition, the quality of the others must have been very high indeed, so suitable were the plants for the purpose, and very skillfully arranged.

Cut flowers made a great display. For twenty-four blooms of Roses, Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester, was 1st with even-sized, well-coloured blooms. The Rev. C. Eddy, Bramley, 2nd. For twelve blooms, Mr. Neville was again successful. The premier bloom—A. K. Williams—was found in his stand of twenty-four. Messrs. Weaver and Norris took 1st and 2nd places for twelve distinct flowers with good collections neatly staged. The blooms of herbaceous perennials made a nice display, Mrs. Kneller having the best.

Bouquets, devices of various kinds in flower, and table decorations were numerous and pleasing in the arrangement of their constituent materials. The winners—all ladies of the neighbourhood—were Miss M. Owen, Miss M. Lowe, Mrs. Osman, Mrs. Rowe, Miss Milsom, and Mrs. Wadmore.

Fruit was numerous, and likewise of good quality. For six dishes, Mr. Osman, gr. to L. J. Baker, Esq., Ottershaw Park, was 1st, and Mr. Best, gr. to — Chute, Esq., Old Vigne, Basingstoke, was 2nd. Black Hamburg Grapes were staged by five competitors, Mr. Holloway, gr. to F. W. C. Reade, Esq., Down Grange, was 1st, with bunches which were excellent in every way, and Mr. Osman was 2nd. For any other Black variety, Mr. Holloway staged good *Alicante*, Mr. Osman coming next with *Madresfield Court*. Mr. Osman had the best *Muscad of Alexandria*.

Melons were numerous and of average quality. A variety named *Countess*, a green-fleshed fruit, from Mr. Norris was the best, as *Blenheim Orange* from Mr. Bowerman, among *Scarlet-fleshed* varieties, *Violette Hative Peaches* and *Lord Napier Nectarine* from Mr. Bowerman, were the finest in the Single-dish Class. Apples were a strong class. *Cherries* from Mr. J. Wasley, gr. to C. Lethbridge, Esq., Sheffield Manor, were very fine. *Apricots* from Mr. Bowerman equally so.

Vegetables, always good at Basingstoke, were well shown for Messrs. Suttons' and Messrs. Webbs' prizes for six dishes, 1st honours being secured by Mr. Lye, gr. to W. H. Kingsmill, Esq., Lydmonton, in both classes; Mr. Kneller following. Messrs. Lye, Kneller, and Bowerman shared the principal prizes in the classes for separate dishes, all competing strongly.

Messrs. Sutton & Sons exhibited an attractive stand, consisting of cut flowers in varieties, and *Gloxinias* in pots. The latter, a choice lot, were from seed sown in February last, and they had several large blooms on each plant.

NORTH OF SCOTLAND APIARIAN.

The annual show of this society was held in Dathie Public Park, Aberdeen, close to the Floral Fete of the Royal Horticultural Society of Aberdeen, on the 20th, 21st, and 22nd ult. The number of entries, as compared with those of last year, showed a slight decrease—a fact attributable to the unpropitious weather that has prevailed of late. The show was opened by Baillie Lyon. He congratulated the promoters on the splendid turn-out of material. "Bee culture," he said, "was one of those recreations that ought to be encouraged, and that the Aberdeenshire County Council, following on the lines of some of the English county councils, should make grants to societies such as that, in order to encourage them in their work."

The Rev. William Jones, Skene, President of the Society, thanked Baillie Lyon for opening the show, and the magistrates present for their presence, and concluded by presenting each of them with a box of honey. The judges of the show were Mr. Stewart, Arbroath, and Mr. Carnegie, Marykirk.

In the course of the day an exhibition of bee driving was given, the prize for which was gained by Mr. Macfarlane, Old Aberdeen.

Special attention was bestowed by visitors on the observatory hive of Mr. William Smart, Apiary Cottage, Torry, which was awarded the 1st prize.

A speciality of the show was an assortment of honey-flavoured cakes made by Mrs. Murray. For the neatest and best display of honey extracted and in comb, Mr. James Shearer, Aberdeen, got the 1st place, the same gentleman securing premier honours for the best collection of honey in sections. Mr. Munro, Crathes, took 1st and 2nd places for sections of comb honey (not heather). He was also 1st for the best sample of wax, and topped the list for the best six 1-lb. jars of run honey. For the best sample shown in glass jar, Mr. Ross, Aberdeen, was 1st; Mr. Craih, Echt, securing the place of honour for the best super of honey. The Society's Silver Medal, for the best collection of hives and bee furniture, was carried off by Miss Mary C. Innes, Free Church Manse, Skene, as also the 1st prize for the most interesting exhibit in the show, in connection with bee culture. Miss Rennie, Aberdeen, was 1st for meal, and also for honey-flavoured cakes, with recipe attached. The arrangements of the secretary, Mr. William Murray, were most complete. The show was visited by a large number of persons.

ROYAL HORTICULTURAL OF ABERDEEN.

THE annual floral *file* of this Society was opened on Thursday, the 20th ult., in the Dathie Public Park, and continued until Saturday, 22nd. As compared with last year's show, there was an increase of entries of 124—the total in the 232 classes being 1731, as against 1607.

Considering the lateness of the season, the exhibits were excellent, and the centre of attraction was the marquee set aside for the gardeners, where four tables, each 18 feet by 6 feet, were filled with stove and greenhouse plants. Mr. Proctor, gr., Devanha House, Aberdeen, took the highest award—the Silver Cup—with a magnificent table, which included *Gleichenia flabellata*, *Erythrina crista-galli*, and two specimens of *Clorodendron Balfourianum*.

Mr. Proctor was 1st for the most tastefully arranged collection of cut flowers. The 2nd prize-table was that shown by Mr. Grigor, gr. at Fairfield; the plants were second in point of size, but perhaps equal so far as the taste displayed, and in cultivation. Mr. Grigor, among other fine plants, showed a flowering specimen of the *Statico Rattreynana*, several very fine *Crotons*, and *Cocos Weddelliana*. Mr. Strachan, gr. to Mr. Fyfe, Beechgrove House, was placed 3rd with a pretty table, which displayed the results of considerable care and skill.

Cut Flowers.—The display of these was a highly creditable one. In the professional division, Mr. J. Proctor was again to the front, securing 1st honours for the best collection of cut flowers arranged on a table 8 feet by 3½ feet. It contained a magnificent lot of *Roses*, and was undoubtedly the best table shown. *Roses* in all the divisions were in splendid condition, and the show of *Pansies* was a very fine one.

The amateur and working-men's sections were almost equal in quality to the professionals. The cut *Roses* were a beautiful show of themselves, and the Duke and Duchess of Fife *Roses*, shown by Messrs. Cocker & Sons, Aberdeen, came in for a large share of attention.

Fruit.—Undoubtedly one of the principal exhibitions in the show was the display of fruit, which has not been surpassed. In the professional section, Mr. A. Reid, gr. to Mr. H. B. Baird, Durris, was awarded the Silver Cup for the best collection of fruit; and Mr. A. Milne, Queen's Road West, was 1st for the best collection of hardy fruit. Mr. Milne's collection contained grand dishes of *Strawberries* and *Currants*. *Strawberries* were shown in all classes in large numbers, the specimens forward being very large and well-flavoured. Mr. Strachan was to the fore with four bunches of *Grapes*, white and black; and Mr. Reid, Durris, was a good 2nd. For *Peaches* and *Apples*, R. K'oh, J. B. Middleton, and J. Grant, received premier honours. These were excellent, and the amateurs ran the professionals very close.

Mr. T. B. Middleton, gr. to Sir Arthur Grant, Bart., of Mynusk, took the premier place for the best collection of vegetables, and Mr. William Anderson, Lower Cornhill, secured a similar position for the best collection open to market gardeners only. Mr. W. D. Brownie, Ellon, carried off similar honours amongst the amateurs, while Mr. W. D.

Kirkton, Ellon, had the finest working-man's display. *Potatoes* were not so good as last year, but the rainy weather is to blame for that. In almost all the prize plates a *Potato* known as the "Maggie" was found. It has been found to be an excellent *Potato*, and a good cropper.

Mr. Taylor, Raeden, carried off the Silver Medal in the professional class for the best four varieties of *Potatoes*.

Reference may here be made to the wild flower competition, open to boys and girls, under sixteen years of age. It was quite refreshing to see the number of whom neglected plants that had been garnered—the *Hairball*, the *Thistle*, the *Erica vulgaris*, the *Meadow Sweet*, the common *Tansy*, and the pretty but neglected *Ox-eyed Daisy*. Miss Robina Paul, Woodside, took the 1st award with a lovely bouquet.

The opening ceremony was performed by Baillie Lyon, and there was a large and distinguished company present.

DEVON AND EXETER HORTICULTURAL.

AUGUST 21.—The Annual Summer Exhibition was held in Exeter, in the lovely grounds of Northernhay. The number of competitors was unusually large, and the quality of exhibits was excellent.

Cut Flowers, Open.—Twenty-four *Roses*, distinct: 1st, Mr. Geo. Humphreys. Forty-eight *Dahlias*, double, distinct: 1st, Mr. Geo. Humphreys, who had a capital stand, including *Ovid*, R. T. Rawlings, Crimson King, Mr. Saunders, J. T. West, H. K'oth, D. Saunders, R. v. J. D. Goody, Major Clarke, J. Cooper, J. Forbes, Maude Fellows, Seeding, Mrs. Humphreys, Peacock, Vice-President, Salamander, Nellie Grand, J. B. Camm, Earl of Ravensworth, Mr. N. Halls, J. T. Saltmarsh, S. Barnett, J. W. Lord, J. Ashby, Duke of Albany, Mr. Giascock, Battercup, Hugh Austin, Gaiety, W. Rawlings, Major Bartlett, Mr. Gladstone, Prince Bismarck, Agnes, Mr. L. Large, Queen of Belgians, Clara, Mr. Campbell, Burgundy, Mr. Harris, Mr. G. Rawlings, J. Stephens, Mrs. Langtry, H. Walton, Countess of Ravensworth, William Garratt, Horid. Forty-eight *Gладиoli*: 1st, Mr. B. James, gr. to Sir W. Lethbridge.

Plant and Flowers in Pots.—Nine stove and greenhouse plants in flower, distinct: 1st, Mr. W. Rowland, gr. to W. Brock, Esq., with well-grown specimens of *Allamanda nobilis* and *A. Hendersonii*, *Platadenia amabilis* and *D. Brearleyana*, *Stephanotis floribunda*, splendidly flowered; *Ixora Williamsii*, very good; *Erica amula*, and *Rondeletia spiciis*.

Nine stove and greenhouse foliage plants, distinct: 1st, Mr. Rowland, with excellent specimens of *Lytania barbonica*, *Cycas revoluta*, *Croton Andreanus*, *C. Johannis*, *C. Prince of Wales*, and *C. Disraeli*, *Anthurium Waroceanum*, *Thrinax elegans*, and *Kentia Belmoreana*.

Six stove and greenhouse foliage plants, distinct: 1st, Mr. Currey, with capital specimens of *Cycas revoluta*, *Lytania barbonica*, *Croton Disraeli* and *C. Countess*, *Kentia australis*, and *Thrinax elegans*.

Nine stove and greenhouse Ferns, distinct.—Mr. Ebbut was to the front with a capital lot of well-grown specimens, fresh and of good colour, including *Davallia*, *fiijensis*, *plumosa*, and *Mooreana*, *Goniophlebium subauriculatum*, *Adiantum Cardiochlamna*, *Microlepia hirta cristata*, *Neottopteris australasiae*, *Neprolepis Davallioides furcans*, *Adiantum grandiceps*, and *Gleichenia nepalensis*.

Miscellaneous collection of plants arranged for effect in an oval, with a diameter of 12 feet by 16 feet. Silver cup, value £5.—Mr. Rowland was deservedly placed first with a superb arrangement, being perhaps the best that has ever been staged at this exhibition; 2nd, Mr. Ebbut, whose collection was excellent, and showed a new departure in arrangement, which will no doubt create a new departure in this class in the future.

Six *Fuchsias*, distinct.—1st, Mr. R. Staddon, gr. to Lord Conchenay, with wonderfully fine and well-grown specimens.

Six *Dracenas*, distinct.—1st, Mr. Rowland, with fine species of *Goldiana*, *Baptisti*, *Cooperi*, *alba marginata*, and *Lindenii Ferrae*.

Six double zonal *Pelargoniums*.—1st, Mr. Prothero.

Six single zonal *Pelargoniums*.—1st, Mr. Prothero.

Fruit.—Collection of Fruit, ten dishes, distinct.—1st, Mr. James Lloyd, gr. to V. Stuckey, Esq., with

good dishes of *Gros Colmar* and *Muscat of Alexandria* *Grapes*; *Brown Turkey Figs*, *Dymond Peach*, good; *Melon* (cross between *Hers of Lockinge* and *Long-leat Perfection*), *Moor Park Apricot*, Mr. Gladstone *Apple*, *Florence Cherry*, *Pine-apple Nectarine*, and *Jargonelle Pear*. 2nd, Mr. A. Crossman, gr. to J. Bruton, Esq., who had splendid dishes of *Dymond Peaches* and *Pine-apple Nectarines*.

Collection of Fruit, six dishes.—1st, Mr. R. Mann, gr. to Sir J. Shelley, Bart., with capital dishes of *Black Hamburg Grapes*, *Crawford's Early Peach*, *Pine-apple Nectarine*, *Moor Park Apricots*, *Melons*, *Plums*.

Vegetables.—*Vegetables* were never staged in better condition. The collection shown by Mr. G. Copp excelled anything ever seen here before—it was simply perfect.

Collections of vegetables, twelve kinds, distinct.—Silver Cup, value £5, and Gold Medal given by *Gardeners' Magazine*: 1st, Mr. G. Copp, with *Celery Wright's Grove White*, *Carrot Sutton's Intermediate*, *Cauliflower Veitch's Autumn Giant*, *Bet Pragnell's*, *Onion Veitch's Main Crop*, fine; *Runner Bean Ne Plus Ultra*, *Tomato Sutton's Perfection*, *Potato Sutton's Seeding*, *Parsnip The Student*, *Leek The Lyons*, *Pea Duke of Albany*, *Cucumber Sutton's Prizewinner*. Mr. Inglefield was an excellent 2nd; and Mr. T. Wilkins, gr. to Lady Theodora Guest, a good 3rd. There were eight competitions. Mr. Copp was 1st for *Pears*, *Spring-sown Onions*, *Tomatoes*, *Ma 10 vs. Co'oured Kidney Potatoes*, *Leeks*, and *Turnips*. Mr. Wilkins was 1st for *Cauliflowers* and *White Kidney Potatoes*.

Messrs. R. Veitch & Son, of Exeter, staged a large collection of plants, including many choice novelties; the *Lilium auratum* and *rubro vittatum* were there in abundance, and were very attractive. They also exhibited a large collection of superb *Carnations*, cut blooms, the following varieties being especially good:—*Souvenir le Grand*, *Lady Middleton*, *Countess of Jersey*, *Victory*, *Lord Rendlesham*, *Mrs. Walford*, *Romulus*, *Golden Beece*, *Old Coin*, and *Mrs. Kerwood*. Also cut blooms of single, double, *Pompone*, and *Cactus Dahlias*, in great variety, with *Phloxes*, *Hollyhocks*, *Begonias*, *Asters*, &c. They staged dishes of their new *Potatoes* *Edgecote Early* and *Prodigious*, both excellent varieties, and altogether a very fine exhibit.

MOOR PARK FLOWER SHOW.

The pleasure-grounds at this place were laid out by the famous Capability Brown, in accordance with the wishes of Commodore Anson, and are delightfully varied with the splendour of the *Conifers*, several of which are unique in size and beauty. The centre of the large marquee was occupied by groups of plants, and the stages around by an excellent array of cottagers' garden produce, among them being about seventy dishes of the best varieties of *Potatoes*. We regret the omission of names in shows of the kind, so necessary as a guide to cottagers in securing the better kinds. The fruit tent was occupied by a splendid display from the home gardens. In this tent was also a very beautiful collection of *pompone Cactus Dahlias*. A large collection of wild flowers, arranged in baskets, was shown, one class competing for effect, and another for number of named species. The beautiful Italian garden was at its best.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

POTT'S SEEDLING AND GROSVENOR APPLES.—Will any of our readers who have trees of either Pott's Seedling, Yorks, or Lord Grosvenor (syn. Jolly Beggar), kindly give their experience of the fruit-bearing qualities of these kinds, stating the age of trees, and the district in which they grow. I wish to know if they are good growers, free from canker; if the trees commence early to bear fruit; if the blossoms are liable to get caught by frosts; and what is the size of the fruit of Lord Grosvenor. A.

Obituary.

MR. JAMES BOLTON, steward and head gardener to — Crookshank, Esq., of Saint Hill, near East Grinstead, Kent, died on Friday, Aug. 28, age fifty-three years, after two days' illness, of congestion of the liver and chronic heart disease. He was for

seventeen years head gardener and bailiff at Combe Bank, Sundridge, and for several years held the same position at Birstall Hall, Leicester. He was a very successful exhibitor at many of the leading shows, and he was greatly respected by all who knew him for his uprightness of character. He leaves a widow, with three young children.

HELEN PORTEOUS KNIGHT.—We regret to have to announce the death of Helen Porteous Knight, the wife of Mr. Knight, the head gardener to the King of the Belgians, at Laeken, and formerly of Floors Castle Gardens. By her estimable qualities, Mrs. Knight endeared herself to a large circle of friends, by whom the greatest sympathy is expressed towards Mr. Knight in his bereavement.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (Day-deg., Night-deg., Accumulated), RAINFALL (Inch., No. of Rainy Days), and BRIGHT SUN. Rows 1-12 represent different districts.

The districts indicated by number in the first column are the following:— Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Gravelly, Ac., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending August 29, is furnished from the Meteorological Office:—

"The weather has been extremely rough, wet, and unseasonable in all parts of the kingdom. Thunder and lightning were experienced from time to time; rain fell almost daily, but towards the close of the period, the conditions were improving considerably.

"The temperature has continued below the mean for the time of year, the deficit having ranged from about 1° in the N. and E. to 3° in the West. The highest of the daily maxima were recorded either on the 26th or 27th, and ranged from 70° in 'England, S.' to 65° in 'Scotland, W.', 'England, N.W.', and 'Ireland, S.' The lowest of the minima were generally registered on the last day of the period, when the sheltered thermometer fell to 36° in 'Ireland, N.', and 37° or 38° in Scotland. Elsewhere they ranged from 40° in 'England, S.W.' to 45° in 'England, S.', and to 52° in the 'Channel Islands.'

"The rainfall has been more than the mean in all districts, but especially in the W. and S. parts of the kingdom, where the fall has been more than double the average.

"The bright sunshine has been below the mean in almost all districts. The percentage of the possible amount of duration has ranged from 39 in the

'Channel Islands,' 36 in 'Scotland, W.', and 35 in 'England, S.W.', to 21 in 'England, N.W.', and 20 in 'England, N.E.'

MARKETS.

COVENT GARDEN, September 3.

LARGE quantities of goods continue to arrive, and are being sold at prices which leave only a small margin for the grower. James Webber, Wholesale Apple Market.

Table of FRUIT—AVERAGE WHOLESALE PRICES. Lists items like Apples, Damsons, Grapes, Kent Cob, Filbert, Lemons, Melons, Peaches, Pineapples, St. Michael, Plums.

Table of CUT FLOWERS—AVERAGE WHOLESALE PRICES. Lists items like Asters, French, English, Bouvardia, Carnations, Geraniums, Chrysanthemums, Cloves, Coriander, Eucharis, Gaillardias, Gardenia, Gladioli, Heliotrope, Lavender, Lilium, Lisianthus, Maiden Hair Fern, Marguerites, Mignonette, Myosotis, Orchids, Catleya, Odontoglossum, Pansies, Pelargoniums, Poppies, Pyrethrum, Roses, Tea, Coloured, Yellow, Heliotrope, Sweet Peas, Sweet Sultan, Tuberoses.

Table of PLANTS IN POTS—AVERAGE WHOLESALE PRICES. Lists items like Aralia Sieboldi, Aspidistra, Ferns, Ficus, Fuchsia, Fuchsia plants, Heliotrope, Hydrangea, Lilium, Marguerites, Mignonette, Myrtle, Palms, Pelargoniums.

Table of VEGETABLES—AVERAGE RETAIL PRICES. Lists items like Artichokes, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Lettuce, Mushrooms, Mustard and Cress, Parsley, Shallots, Spinach, Tomatoes, Turnips.

POTATOS.—Supply not so heavy, prices consequently rule higher. J. B. Thomas.

SEEDS.

LONDON, Sept. 2.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report all descriptions of Clover seed as strongly held. American red meets with especial favour. Cable quotations come higher to-day, values across the Atlantic being pushed up by heavy German buying. The recent terrible weather has naturally hardened prices for all seeds. Winter Tares and Rye are in brisk request, but short supply. Available stocks of Trifolium are meagre, but the demand is as yet small. For Mustard and Rape seed the tendency is upwards. Fine blue Peas are wanted. Hemp seed is considerably dearer.

POTATOS.

BOROUGH: Sept. 1.—Quotations:—Regents, 70s. to 80s.; Hebrons, 55s. to 70s.; Kidneys, 65s. to 70s.; Imperators, 60s. to 70s. per ton.

SPITALFIELDS: Sept. 1.—Quotations:—Magnums, 60s. to 70s.; Myatt's Kidneys, 60s. to 70s.; Regents, 60s. to 55s.; Imperators, 60s. to 75s.; Hebrons, 60s. to 70s.; Snowdrops, 60s. to 80s. per ton.

STRATFORD: Sept. 1.—Quotations:—Magnums, 55s. to 70s.; Hebrons, 55s. to 70s.; White Elephants, 55s. to 70s.; Regents, 60s. to 70s.; Snowdrops, 70s. to 105s.; Imperators, 60s. to 70s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Aug. 29, and for the corresponding period last year.—1891. Wheat, 40s. 11d.; Barley, 27s. 7d.; Oats, 21s. 9d. 1890. Wheat, 55s. 9d.; Barley, 31s. 3d.; Oats, 19s. 2d. Difference Wheat, +4s. 4d.; Barley, -3s. 8d.; Oats, +2s. 7d.

FRUITS AND VEGETABLES.

BOROUGH: Sept. 1.—Quotations:—Cabbages, 2s. to 3s. per tally; Onions, 1s. 6d. to 2s. 6d. per dozen bunches, and 5s. per cwt.; Carrots, 1s. 6d. to 2s.; and Turnips, 1s. 6d. to 2s. per dozen bunches; Marrows, 5d. to 7d. per dozen; Peas, 2s. to 3s. per bushel, and 3s. to 4s. per bag; Scarlet Beans, 1s. 6d. to 2s.; French Beans, 1s. 6d. to 1s. 9d.; and Broad Beans, 1s. per bushel.

SPITALFIELDS: Sept. 1.—Quotations:—Cabbages, 1s. 6d. to 3s. per tally; Marrows, 9d. to 1s. 3d. per dozen; Spinach, 1s. to 1s. 6d. per bushel; French Beans, 1s. 6d. to 2s. do.; Scarlet do., 1s. 6d. to 2s. do.; do., 2s. to 3s. per sack; Peas, 2s. to 4s. 6d. per sack; Radishes, 2s. to 3s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 2s. to 2s. 6d. per cwt.; Carrots, 2s. to 2s. 6d. per dozen bunches, and 30s. to 50s. per ton; Parsley, 1s. to 2s. per dozen bunches; Horseradish, 12s. to 13s. per dozen bunches; Celery, 6d. to 1s. per bundle; Cos Lettuce, 4d. to 6d. per score; Cabbage do., 3d. to 4d. per dozen; Mustard and Cress, 1s. 6d. per dozen baskets; English Apples, 2s. to 4s. 6d. per bushel; Peas, 2s. to 2s. 6d. per half-sieve; Victoria Plums, 1s. 6d. to 2s. do.; Orleans Plums, 2s. to 3s. do.; Greengages, 3s. to 3s. 6d. do.; and 2s. to 3s. per flat; English Tomatoes, 4s. to 7s. per 12 lb.; foreign do., 1s. to 2s. per box.

STRATFORD: Sept. 1.—There has been a good supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 2s. to 3s. 6d. per tally; Cauliflowers, 1s. 6d. to 2s. 6d. per dozen; do., 7s. to 10s. per tally; Carrots, household, 10s. to 50s. per ton; Mangels, 20s. to 25s. do.; Onions, English, 80s. to 100s. do.; do., Egyptian, 100s. to 105s. per bag; do., Onions, 7s. to 8s. per cwt.; Apples, English, 1s. 6d. to 6s. per bushel; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 20s. to 40s. per ton; Carrots, 1s. 6d. to 2s. 6d. per dozen bunches; Celery, 9d. to 1s. 3d. per roll; Scarlet Beans, 1s. to 2s. per sieve; do., 2s. to 3s. 6d. per sack; French Beans, 1s. to 1s. 6d. per sieve; Plums, 1s. 6d. to 2s. 9d. per half-sieve; do., 2s. 6d. to 5s. per bushel; Greengages, 2s. to 2s. 6d. per half-sieve; do., 4s. to 5s. per bushel.

NOTICES TO CORRESPONDENTS.

ANTHURUM VEITCHI: Dresden. This plant was introduced from Colombia to the nurseries of Messrs. Veitch by Mr. Wallis. First described and figured in Gardeners' Chronicle of December 16, 1876.

ANTS IN HOUSES: Anti Ants. Either chloride of lime or carbolic acid strewn in their haunts will drive the ants away.

BEETLES IN A FRUIT-ROOM: E. W. Keating's Insect Powder dusted over the shelves is very efficacious.

CARNATION: V. Cephalotaxus Fortunei. It is very common for Carnation to sport; the phenomenon is looked upon as an unmixing of previously combined characters.

DISQUALIFICATION OF EXHIBITS: Devon. According to the wording of the schedule, which must be interpreted in a gardener's, not in a botanist's sense, both of you were wrong in exhibiting Clematis, Hydrangea, and Hypericum, amongst "Hardy Perennials."

"HARDY PERENNIAL" AND BULBOUS FLOWERS: A. We are of opinion that the judges did rightly in disqualifying a stand containing a spike of Hydrangea paniculata grandiflora.

MELONS: Subscriber. The female blossoms should be set on the morning of their opening, and not when the unfertile fruit has got to "the size of a Filbert." Having so many as 200 plants, you ought to take every care to get an early set, as the fruits will be no value if they do not ripen before the end of October.

MELONS ON GALVANISED IRON BOTTOM: Gardener. It is not an uncommon experience to find vegetation injured by contact with the zinc deposited on the iron. Whether it is the zinc, or the remains of the muriatic acid, the metal receives before it leaves the workshop, that causes the injury is not known. Possibly a coat of boiled gas-tar would prevent injury in the future. Melons are not injured by tar.

NAMES OF FRUIT: A. H. 1, Malx Codlin; 2, New Hawthornden.—W. C. I, Summer Franc Real; 2, Windsor, syn. Green Windsor.—J. H. B. Pershore Plum.

NAMES OF PLANTS: Miss F. Epipactis latifolia.—E. W. G. Lysimachia clethroides, Pyrethrum uliginosum.—G. P. Campanula rapunculoides.—L. G. 1, Ooecidium micropogon; 2, Galeandra nivalis.—J. B. K. A dark variety of Aristolochia elegans.—A. B. I, Monarda didyma; 2, Caulocalis Anthiscus; 3, Salvia verticillata; 4, Fagopyrum esculentum.—F. E. I, Rudbeckia laciniata; 2, R. occidentalis; 3, Helianthus rigidus var.; 4, Rudbeckia speciosa; 5, Helianthus rigidus (type); 6, H. multiflorus fl.-pl.; 7, Chrysanthemum uliginosum; 8, C.

lacustre.—*W. W.* *Alocasia illuaria*; *Cassia corymbosa*.—*W. M.* *Scrophularia aquatica*.—*G. W.* *Saponaria officinalis*. *Begonias* next week.

NECTARINE WOOD DISEASED: *J. B.* The wood has been taken possession of by the mycelium or spawn of some fungus, which originated probably on decayed wood in the soil. This had gained entrance by means of a wound or decayed part of root or stem, and spread between the bark and the wood. Cut away and burn all parts that show signs of being attacked by the fungus.

PEACHES FALLING OFF: *A Subscriber*. Possibly drying of the soil about the roots may be the cause.

POST ON A TEA PLANTATION: *W. W.* Advertise in this Journal, or in the Indian papers.

TOMATO FUNGUS: *M. W.* Both specimens are some forms of the same disease. Try Tait's Anti-Blight Powder.

VINES, TO START IN NOVEMBER, &c.: *H. W. P.* It would be better practice to partially prune the Vines as soon as the foliage is mature, say, at the end of this month, leaving the current season's shoots about 6 inches long, and doing the final thinning a month afterwards. There is no list published of fruit-growers; but one of florists is given in the *Garden Annual*, published at the *Garden* office.

WILSON JUNIOR BLACKBERRY: *R. S. & Co.* The branch sent was well fruited. We are aware that it succeeds in many parts of this country, and fails as do most of the American varieties in others. The southern parts of England seem to suit them best.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—JOHN DOWDIE, Seedsman, 144, Princes Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN) Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

GARDENER (HEAD) and ORCHID GROWER.—Age 31; seventeen years' experience in Orchids, Stove and Greenhouse Plants, early and late Forcing, hardy Fruit, Flower, and Kitchen Gardens.—WILLIAM LAKER, Quorn Lodge, Loughborough, Leicestershire.

GARDENER (HEAD), where three or more are kept; fifteen years' experience in all branches of Gardening. One year and nine months' good character. Six years previous with Mr. Culverwell, Thorpe Perrow, Bedale.—S. SEDGWICK, Leyburn, Bedale.

GARDENER (HEAD); married; has small family.—Mrs. HENRY BRASSEY wishes to recommend her Head Gardener, who is leaving on account of the death of the late Mr. H. A. Brassey, as above. Thoroughly experienced in all branches, Forcing, &c. Thoroughly honest, and abstainer.—Apply, Preston Hall, Aylesford, Kent.

GARDENER (HEAD), in a good establishment.—Age 32, married, no family; has had the best experience in every department. To any Nobleman, Lady, or Gentleman requiring a first-rate man in every respect. The highest testimonials.—HORTICULTURE, Messrs. Sutton & Sons, Reading, Berks.

GARDENER (HEAD).—KIPPS, late Head Gardener, &c., to W. H. Bingham Cox, Esq., Totnes, seeks re-employment, near London preferred. No encumbrance.—Newgate Street, near Hertford.

GARDENER (HEAD).—Age 43; twenty-nine years' experience. Sixteen years' Head. Left through death.—F. SMALL, Buckingham Road, Winslow, Bucks.

GARDENER (HEAD).—Age 42, married, no family; experienced in all branches of Gardening, Early and Late Forcing, and General Management of good establishment.—W. D., 2, Alberta Place, London Road, Bishop's Stortford.

GARDENER (HEAD).—Age 30, single; twenty years' experience in all branches of Gardening; English and Californian experience. Advertiser wishes to settle down in England, either in private or commercial establishment in vicinity of London. Good references. No Single-handed place accepted.—T. G., 11, St. Ann's Place, Chester.

GARDENER (HEAD WORKING).—Age 29; good practical experience in all branches. Four years' reference as Foreman. For particulars.—FOREMAN, The Gardens, Harewood House, near Leeds.

GARDENER (HEAD WORKING).—Age 32, no family; life experience in all branches. Excellent character.—E. W. JENKINSON, Head Gardener, Kirby Frith Hall, Leicester.

GARDENER (HEAD WORKING), or FOREMAN, in Kitchen Garden.—Age 28, single; experienced in all branches.—S. B., Lock Road Cottage, Ham Common, Surrey.

GARDENER (HEAD WORKING); age 36, married.—Mr. E. MOLYNEUX, Swanmore Park Gardens, Bishop's Wallham. He would be glad to recommend a really first-rate man as above. He thoroughly understands his duties in every respect, especially Flower-garden Management. His best references from past employers. Thoroughly industrious in every respect.—Apply as above.

GARDENER (HEAD WORKING).—Age 38, married, small family. Thoroughly experienced in Vines, Stove and Greenhouse plants, and the general management of the Flower and Kitchen gardens, and also a good grower of Chrysanthemums.—Six and a half years' excellent character. Disengaged through owner leaving.—H. GALE, Princes Terrace, Prince Alfred Street, Gosport.

GARDENER (HEAD WORKING).—Age 37, married; excellent experience. Left through death. Nine years' good character from last situation, six and seven previously.—T. DINEL, 2, Victoria Terrace, Ham, near Richmond.

GARDENER (HEAD WORKING), where one or two others are kept.—Age 29, married; thirteen years' experience in Vines, Peaches, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Good character.—G., Mr. Burt, Albert Road, Cosham, Hants.

GARDENER (HEAD WORKING), where two are kept.—Age 27. Twelve years' thorough practical experience in all branches of the profession.—C. S. R., Mr. Mills, Avenue Road, St. Neot's, Hants.

GARDENER (HEAD WORKING).—Age 31; widower; three children. Thorough practical experience in all branches. Disengaged, October 16.—W. CLAYTON, Head Gardener, Maesgwynne, Whitland, S. Wales.

GARDENER (HEAD WORKING), where two or more are kept.—Age 31, married, no family; eighteen years' experience in all branches. Six and a half and seven years' good character.—E. G., Skellington, Leicester.

GARDENER (HEAD WORKING).—Age 32, married; well up in all branches; seeks re-employment through employer leaving the neighbourhood. Can be highly recommended.—BARNES, Eversfield, Grove Park, Kent, S.E.

GARDENER (HEAD WORKING); age 28, married.—Mr. OFFER, Handcross Park, Crawley, can with confidence recommend his Foreman to any Lady or Gentleman requiring a good practical all-round man as above. He has been with him four years.

GARDENER (HEAD WORKING), where three or more are kept.—Age 35, married, one child (age 3); twenty years' experience in all branches of Gardening. Disengaged when suited. Character will bear the strictest investigation.—J. B., 29, Choumert Road, Peckham, S.E.

GARDENER (HEAD, or SINGLE-HANDED).—Age 30, married, one child. Thoroughly practical. Inside and Out. Excellent character and testimonials.—MACK, 2, Homestead Villas, Riverdale Road, Plumstead, S.E.

GARDENER (HEAD, or SINGLE-HANDED).—Age 27, married; experienced in Peaches, Vines, Melons, Tomatos, &c. Three years at last place.—W. W. LANE, Malvern Hall, Solihull.

GARDENER (HEAD, or SINGLE-HANDED).—Age 34; married; small family. Thoroughly practical in all branches, also in the management of Stock. Good character. Please state wages.—J. S., Alfred House, Magdala Road, Highgate, N.

GARDENER.—Mr. W. B. BACON, who is removing, wishes to recommend his Head Gardener, thoroughly competent and trustworthy. Six years' excellent characters.—For particulars, apply to Down House, Lamberhurst, Hawkhurst.

GARDENER; age 43, married.—A GENTLEMAN who is breaking up his establishment, would be pleased to recommend his Gardener, who has been with him thirteen years, to any Lady or Gentleman requiring the services of a thoroughly competent man.—J. WOODARD, Faircrouch Road, Wadhurst, Sussex.

GARDENER (SINGLE-HANDED, or otherwise).—Age 22, single. Five years' reference from late employer. Total abstainer. Willing to make himself useful.—GARDENER, 6, Elm Terrace, Elm Road, Leytonstone.

GARDENER (SINGLE-HANDED).—Age 29; married; fourteen years' experience in Grapes, Melons, Cucumbers, Chrysanthemums, and the general routine of a kitchen garden; first-class references; in present place ten years.—W. FLEET, Dudley Lodge, Harrow.

GARDENER (SINGLE-HANDED).—Age 24; four and a half years' good reference.—A. G., St. Mary Cray, Kent.

GARDENER (WORKING), where assistance is given.—Age 31, married, one boy; thoroughly experienced in Grapes, Cucumbers, Tomatos, Chrysanthemums, Begonias; Flower Garden a specialty. Well up in Vegetables. First-class references.—J. G. F., Simpson, Stationer, Marshgate, Richmond, Surrey.

GARDENER (SECOND), or FOREMAN, in good establishment.—Age 24, single. Bothy preferred. First class references from past and present employers.—STEPHEN MALLETT, Morpeth House Gardens, Ipswich.

GARDENER (UNDER, or SINGLE-HANDED); age 22.—Mr. GRANT, the Rookery Gardens, Dorking, would like to recommend to any Gentleman or Gardener, W. Goddard, as above.—W. GODDARD, Compton, Guildford.

GARDENER (UNDER, or SINGLE-HANDED).—Age 28, single. Good experience; excellent character.—W., 7, Chatham Road, Camberwell, S.E.

GARDENER (UNDER).—Age 22; five years' experience Inside and Out; and can have five years' references, if required.—H. YOUNG, The Cottage, Holly Lodge, Wimborne Road, Bournemouth, Hants.

GARDENER (UNDER).—Age 20; good knowledge in all branches. One year and ten months' excellent character.—CHALLIS, Mountfield, Child's Hill.

GARDENER (UNDER); Inside, or Inside and Out.—Age 21. Well recommended by Head Gardener to Sir Wm. Cooke, Bart., Wheatley Park, Doncaster.—E. MORRIS, 13, Park Road, Doncaster.

GARDENER (UNDER); age 19. Mr. HAYES, The Gardens, Keswick, Cumberland, wishes to recommend a strong and energetic young Man as above. Good knowledge of Greenhouse and Herbaceous Plants, and General Work.

GARDENER (UNDER).—Age 20; three years with Leopold de Rothschild, Esq.; used to Greenhouse work.—BIRSEY, 9, St. Paul's Terrace, New Southgate.

GARDENER (UNDER), or in a Nursery.—Age 23. Three years' good character.—H. BEAC-CHAMP, 71, Cowper Street, West Brighton.

PROPAGATOR and GROWER.—Age 26. All Market Plants, Ferns, Vines, Tomatos, Cucumbers, &c.—H., Gardeners' Chronicle Office, 11, Wellington Street, Strand, W.C.

PALM and FERN GROWER.—Age 28. Furnishing in large establishment. Fourteen years Nursery experience. Good character.—THOS. EDDYEN, Esher House, Humbolt Road, Hammersmith, W.

FOREMAN, in the Houses.—Age 24; eight and a half years' experience. Abstainer. Good reference.—W. HILL, The Gardens, Coed Coch, Abergele, North Wales.

FOREMAN (WORKING), Indoors.—Age 31; thorough Propagator and grower of Market Plants in quantity, and expert at Lily and Bulb forcing.—C. I., Grosvenor Terrace, Chiswick, W.

FOREMAN, in a good Establishment.—C. PUZEY can with every confidence recommend his Foreman, F. Lupton, as above.—Scampston Hall, Rillington, Yorks.

FOREMAN, in large establishment; age 28.—Mr. FRIEND, gardener to the Hon. P. C. Glyn, Rooknest, Godstone, can confidently recommend his late Foreman to any gardener requiring a thoroughly practical and deserving man; fourteen years' experience.

FOREMAN, PROPAGATOR, and SALES- MAN, or MANAGER (Indoors)—Thoroughly practical in the Cultivation of all kinds of Plants; over thirteen years in the same capacity with Messrs. J. S. Veitch & Sons, Royal Exotic Nursery, Chelsea.—C. SWIFT, 309, North End Road, Waltham Green, S.W.

HOLLOWAY'S OINTMENT and PILLS.—A frequent cause of gout and rheumatism is the inflammatory state of the blood, attended with bad digestion and general debility. A few doses of the Pills taken in time are an effectual preventive against gout and rheumatism. Anyone who has an attack of either should use Holloway's Ointment also, the powerful action of which, combined with the operation of the Pills, must infallibly effect a cure. These Pills act directly on the blood, which they purify and improve. Having once subdued the severity of these diseases, perseverance with the Ointment, after fomenting the affected joints with warm brine, will speedily relax all stiffness, and prevent any permanent contraction.

The Property possesses a commanding Frontage to the High Road, which can be utilised for Building. Possession will be given on completion of the purchase.

May be viewed. Particulars had on the Premises; at the Mart, E.C.; of W. F. WATSON, Esq., Solicitor, 43, Southampton Buildings, Chancery Lane, W.C.; and of the Auctioneers and Surveyors, 67 and 68, Cheapside, E.C.

Hammersmith.—Absolutely without Reserve. SALE of the BENEFICIAL INTEREST in the LEASE and STOCK in TRADE of a well-established CUT-FLOWER and FLORIST BUSINESS.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, The Peacock Nurseries, Hammersmith, on MONDAY, September 28 (instead of September 25, as advertised last week), at 12 o'clock, unless previously disposed of by private contract, the BENEFICIAL INTEREST in the LEASE.

Immediately following the Sale of the Lease, the whole of the STOVE and GREENHOUSE PLANTS and other STOCK, also the UTENSILS in TRADE, will be SOLD by AUCTION in suitable lots.

May be viewed. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Friday Next.

THE TRUE OLD AUTUMN-FLOWERING CATTLEYA LABIATA.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to sell by auction at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, September 18, at half-past 12 o'clock, a magnificent importation of the TRUE OLD AUTUMN-FLOWERING CATTLEYA LABIATA.

The whole importation is offered, and the plants are in magnificent order and condition, from 4 to 6 flower buds can be seen on the old spikes, many of which are of enormous size and thickness.

ALL THE PLANTS ARE GUARANTEED TRUE.

The genus Cattleya was founded upon the species we now offer. Dr. Lindley first described it from Swainson's plant introduced in the year 1818, and named it in honour of W. Cattley, Esq., of Barnet. This plant now re-discovered and re-introduced is absolutely the CATTLEYA LABIATA AUTUMNALIS VERA from Swainson's original hunting ground, and to the indefatigable enterprise and persistent zeal of Mr. F. Sander are we indebted for this greatest desiderata of Orchidists.

There will also be included in the above sale a NEW AND UNDESCRIBED SPECIES OF CATTLEYA, also a new STANHOPEA.

A very fine lot of the rare and beautiful

ANSELLIA AFRICANA NILOTICA

the finest of the genus, the colours being brighter and more distinctly defined than the type.

CYPRIPEDIUM INSIGNE SIAMENSE.
ODONTOGLOSSUM HASTIATUM, in fine masses.
ONCIDIUM PAPILLI MAJUS.
CYMBIDIUM EBURNUM.
CYPRIPEDIUM BOXALII and VENESTUM.

Also some choice and valuable Established Orchids, amongst which will be found:—

DENDROBIUM LEECHIANUM, strong plants.
" NOBILE SANDERIANUM,
" COCKSONII,
" HYBRIDUM VENUS.
" CASSEPOE.

LILIA ANCEPS WHITE.

" GOULDIANA.
SPATHOGLOTTIS KIMBALLIANA.
SCHOMBURGKIA SANDERIANA, new.
VANDA SANDERIANA.
CERIOGYNE SANDERIANA.

" DAYANA, and many other choice Varieties.
On view morning of sale and catalogues had.

Bagshot.

HIGHLY IMPORTANT THREE DAYS' UNRESERVED SALE of beautifully-grown and well-rooted NURSERY STOCK, which has been carefully prepared for removal, and specially selected for this Sale, by order of Messrs. John Waterer & Sons, Limited.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the celebrated Bagshot Nurseries, Bagshot, Surrey, close to Bagshot Station, on WEDNESDAY, September 30, and two following days, at 12 o'clock each day, without reserve, several acres of NURSERY STOCK, grown to the greatest perfection, and exceedingly well-rooted, comprising a variety of Conifers, splendid specimens, 4 to 7 ft., particularly adapted for effective planting; well-coloured Golden Retinosporas; very fine specimen Gold and Silver Variegated Hollies, 4 to 6 ft.; fine-grown examples of Waterer's Holly; Standards and Pyramis fine single specimens; 1000 Green Hollies, 3 to 5 ft.; very fine English Yews, 2½ to 3 ft.; 200 named Rhododendrons, 2 to 2½ ft., bushy plants of the best and newest kinds; Ponticum Rhododendrons in quantity; 3000 Spruce Firs, 2½ to 4 ft., and a quantity of larger plants adapted for Christmas Trees; 5000 Standard Ornamental Trees, 8 to 12 ft.; Purple Beech and Limes, 10 to 12 ft.; thousands of Flowering Shrubs; and other stock.

Purchasers will be allowed until December 31, 1891, for the removal of their lots.

May now be viewed. Catalogues can be obtained on the Premises, or on application to the Auctioneers, 67 and 68, Cheapside, E.C.

The Chilwell Nurseries, Chilwell, Notts.

Three-quarters of a mile from Boston Railway Station, Midland Railway.

IMPORTANT SALE of EVERGREENS, CONIFERÆ, &c., growing upon two branch nurseries which are required for building purposes by order of Messrs. J. R. Pearson & Sons.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, on the Premises as above on THURSDAY, October 1st, at 1 o'clock precisely, 1,000 specimen GOLDEN YEWs, a fine collection of Green and Variegated HOLLIES, 900 Bushy AUCUBAS, specimen and half-specimen RHODODENDRONS, of the finest named varieties, thousands of SMALL SHRUBS for potting or growing on, 300 YUCCA FILAMENTA VARIEGATA, the largest number of this scarce plant ever offered, 4,000 LAURELS of sorts, 1,200 CUPRESSUS, including 400 C. ARGENTEA, perfect specimen Standard and Dwarf ROSES, STANDARD THORNs and other Stock.

This Sale is especially worthy of attention owing to the high-class character of the Stock, all of which has been recently transplanted and grown with plenty of room.

The Golden Yews and Yuccas, for which the Nurseries have long been famous, are the finest lot ever offered by Public Auction.

May be viewed one week prior to the Sale. Catalogues obtained on the Premises, and of the Auctioneers, Cheapside.

En eld, Middlesex

"NEW MILLTRACK" MUSHROOM SPAWN, and nothing else.

The only exclusive business of the kind in England.

BASON'S WONDERFUL "NEW MILLTRACK" MUSHROOM SPAWN

is the best, and has achieved more success than any other Spawn in the world. *See Press Notices and recent Testimonials, with dates, from leading authorities throughout the Kingdom.* Price, 6s. per bushel of sixteen cakes, the largest ever offered (*cases and packing free*). Sample Cake, with Cultural Directions, by Parcel Post, 3d.

The Gardens, Lewiston House, Sherborne, Dorset. August 31, 1891.

The "NEW MILLTRACK" MUSHROOM SPAWN I had from you last year, proved very good indeed. I never had a better crop, the Mushrooms being large, thick, and of grand flavour. Please send me on two more bushels at your earliest convenience.—A. RUNNACLES.

The Gardens, Knowle Hall, near Birmingham. August 29, 1891.

Be good enough to send me one bushel of your A1 "NEW MILLTRACK" MUSHROOM SPAWN. About this time last year, I had a bushel, with which I spawned seven beds; these being made at intervals through the year, have kept up a continuous supply, and the last bed is still producing plenty of grand Mushrooms, and, to all appearance, will keep up the supply for another month.—WILLIAM COMFORT.

Sole Proprietor, and positively the only Manufacturer, of "NEW MILLTRACK" MUSHROOM SPAWN, for Home and Export.

MANAGER, Osborne House Fruit Farm, Wisbeach.

DO THEY DESERVE IT?

FIFTY YEARS' WORK AHEAD.

We are driven back with the Cactus Dahlia section; yes, even the good old popular Juarezi and all its many offsprings with their highly-popular names, that have given this class such emphasis and annual delight ever since its introduction by us. They are now positively made to look coarse, poor, and unattractive, when seen side by side of one raised and exhibited by us at the NATIONAL DAHLIA SOCIETY'S SHOW at the CRYSTAL PALACE, called

ROBERT CANNELL.

Not only by experts but by all; all crowded to see this glorious gem, for it was in open conversation throughout the building, and was pronounced by all the greatest critics the very ideal of the future Cactus Dahlia. It will take many years labour to bring all colours to its elegant shape. It was admitted a real floral victory, which usually occurs only once in half a century, yet it merely received the ordinary award given to others barely different from those already in cultivation. It is not only its elegant shape and perfect form but its lovely colour which has the undebatable tint of blue upon its petals. It was frequently said, "Here is the beginning of the Blue Dahlia at last." This grand kind will be sent out next May at One Guinea each. W. HOPKINS, Esq., Bristol, ordered and paid for two on the spot in front of a large concourse of people. We ask all to send for a Catalogue, then "COME AND SEE" the King of the Cactus Dahlias growing and blooming in all its beauty.

H. CANNELL & SONS,
SWANLEY, KENT.

VANDA CÆRULEA.

A grand lot of the above are now finely in bloom, and well worthy a visit by Gentlemen interested in the culture of this lovely Orchid. Inspection cordially invited.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 12, 1891.

THE ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

[SEE SUPPLEMENTARY SHEET.]

THIS society, on which the attention of horticulturists in all parts of the kingdom is for the time concentrated, was founded in 1809, and incorporated by charter in 1824. Its objects were very similar to those of the Royal Horticultural Society, instituted about the same time. The society maintained a garden for several years, but finding the cost too onerous, after a period of much difficulty, the garden was annexed to the Royal Botanic Garden, and is now utilised as an arboretum. The first president was the Duke of Gordon, and he was succeeded by Sir James Hall, a celebrated horticulturist, two Dukes of Buccleugh, and the Earl of Dunmore; the present President being the Marquis of Lothian, K.T. The first secretary was Mr. Patrick (afterwards Dr. Neil), an enthusiastic promoter of horticulture. Professor Balfour succeeded Dr. Neil, to be followed by Mr. John Stewart, whose son, Mr. Charles Stewart, now fills the office, with Mr. William Young as assistant secretary; whilst the present treasurer is P. Neill Fraser, Esq., an ardent and talented horticulturist. In its long career the society has attracted to it the best-known Scottish horticulturists and botanists, and the names of MacNab, Anderson-Henry, Gorrie, and Sadler, not to mention many others, have cast a lustre on the society, which in its present enterprise, is out-doing all its previous efforts.

In a Supplementary Sheet we give portraits of some of the leading members of the Council, including the following:—

THE MARQUIS OF LOTHIAN, K.T., Secretary of State for Scotland—a most liberal patron of arts and sciences. Horticulture, agriculture, and forestry are especial subjects of interest to him. The excellent management and prosperous condition of the fine estates of Newbattle Abbey, in Midlothian, and Mont Teviot, in Roxburghshire, the popularity of Lord Lothian with his tenants on these estates, the splendid gardens and thrifty woodlands, all testify to his active personal interest in domestic affairs; and as President of the Arboricultural Society during the year that society held its forestry exhibition in Edinburgh, and as President of the Highland and Agricultural Society, he extended the same active sympathy to public movements for the furtherance of the objects aimed at by these bodies. As President of the Caledonian, he lends lustre to that ancient Society; and by the monograph of Masdevallias published under his auspices, and illustrated by plants from his own collection at Newbattle, he contributes to the progress of scientific botany.

MR. WILLIAM YOUNG, Assistant-Secretary to the Royal Caledonian Horticultural Society, is an amateur gardener of more than local fame. Reared in the town of Haddington, the centre of East Lothian gardening in the earlier decades of the century, he

carried with him to Edinburgh, where he eventually settled, his taste for florists' flowers, particularly Auriculas, in the culture and breeding of which he is a specialist. His knowledge of florists' flowers, and his aptitude for managing flower shows, quickly brought him into notice with all interested in gardening progress. For the past fifty years he has been a foremost figure in horticultural movements. He was fifteen years treasurer to the Scottish Pansy Society, for seven years he was Secretary to the Scottish Gardeners' Society, and for thirty years he has acted as Assistant-Secretary to the Royal Caledonian Horticultural Society—twenty years of that time *con amore*, and without salary or any pecuniary benefit whatever. In short, he is an enthusiast, whose enthusiasm increasing years in no way lessens.

MR. MALCOLM DUNN, whose name is a household word with horticulturists, both in the north and the south, is, however, best known in connection with The Gardens, Dalkeith Park, which he has managed so well during the last twenty years. Formerly, at Powerscourt, Ireland, he distinguished himself by the masterly way in which he tackled the Phylloxera and stamped it out, giving courage to Grape growers generally when panic threatened them all round. His attainments as a pomologist are widely known, and his energetic aid to and advocacy of every movement having the advancement of horticulture as its object, are warmly appreciated by every horticulturist north of the Tweed.

MR. ROBERT LINDSAY, Curator of Botanic Garden, Edinburgh, in his earlier years was some time under the late Mr. Thomas Moore in the Chelsea Botanic Garden; subsequently, he served for a number of years under the late Mr. James MacNab in the celebrated garden of which he is now curator. He was appointed to the charge in 1883. Throughout his career he has exhibited the rare combination of scientific bias and practical application in his profession. His achievements as a hybridist, particularly of *Nepenthes*, are a credit to himself and to the establishment with which he is connected, and his appointment to the presidential chair of the Botanical Society of Edinburgh, which he has held for two successive sessions, is but a just recognition of his high attainments in botanical and horticultural science.

MR. ANGUS A. McLEOD, Superintendent of the City Gardens, Edinburgh, in his earlier years acquired his experience at Burghley Park, Mitton, Wentworth, and the Royal Exotic Nurseries, Chelsea. Subsequently he served the Marquess of Lothian as head gardener at Newbattle Abbey, Midlothian, for nineteen years. He was appointed to the charge of the City Gardens in 1875. During the past twenty-seven years he has borne an active part in the management of the Royal Caledonian Horticultural Society, and for his services to the society and to horticulture generally was awarded the Neill Prize and Medal in 1890.

MR. JOHN DOWNIE, one of the fathers of the Scotch nursery trade, served his apprenticeship as a gardener at Canaan House, Edinburgh. At the early age of twenty years, at the death of his father, he was called upon to fill his place as head gardener at South Bank, Edinburgh; and where he remained ten years. At that place he was able to take a high position at the local shows, his exhibits, especially florists' flowers, being of great excellence. In 1848 he associated himself with Mr. R. B. Laird, thus establishing the firm of Downie & Laird, which obtained a world-wide celebrity in connection with the improvement of all classes of florists' flowers. Retiring from the firm of Downie & Laird in 1883, he has since been trading in his own name. During a long career Mr. Downie has had many triumphs, but space will only admit of our particularising one. He was the originator of the now popular race of "fancy" Pansies. About 1858, at a flower shower show in London, he exhibited thirty blooms in six varieties, the progeny of one named Dandie Dinmont. These were the first fancy Pansies ever exhibited, and they were commented upon in the *Times* of the

date as follows:—"Messrs. Downie & Laird of Edinburgh, exhibit some strange looking Pansies, striped and splashed in the most extraordinary manner." Mr. Downie has been an ardent supporter of every movement for the improvement of gardening and gardeners throughout his long and successful career. Among other working members of the Society are Messrs. Milne, Thomson, Clapperton, MacKinnon, D. P. Laird, Metbven, Moncur, Welsh, Stewart, Cowan, and Neill-Fraser, all eminent Scotch horticulturists.

MR. R. B. LAIRD. — We take the following details from *The Piper o' Dundee*, which also contains a pleasing portrait of a very popular man. Mr. Laird was born at Balgonie, near North Berwick, on May 16, 1823. He commenced his career with his brother, the late Mr. W. P. Laird, founder of the firm of Laird and Sinclair. In 1843, with a view of gaining wider experience, he entered into an engagement with Messrs. Dickson & Co., of Edinburgh, where he remained for five years. Mr. Laird then entered into partnership with Mr. John Downie—the firm of Downie & Laird, winning a high reputation. In 1860, Mr. John Laing, then gardener to the Earl of Roslyn, was assumed as a partner, the firm being known as Messrs. Downie, Laird, & Laing, a branch establishment being opened at Forest Hill, London, under the superintendence of Mr. Laing. The partnership continued until 1874, when Mr. Laing retired from the firm, taking over the London branch, which he still carries on. Mr. Downie and Mr. Laird continued the Edinburgh business under the original name of the firm. In 1882, the firm of Downie & Laird was dissolved, Mr. Laird taking over the entire business, which he carried on with his sons Mr. D. P. Laird and Mr. R. Laird. Owing to the death of his brother, in 1872, Mr. Laird became senior partner of the firm of Messrs. W. P. Laird & Sinclair, Dundee; and on the death of his two partners, Mr. Sinclair and Mr. Hardie, in 1885, after a lapse of over forty years, he returned to Dundee, and took over the whole business. Mr. R. B. Laird is now head of both the Edinburgh and Dundee firms. From their establishment these businesses have gone on enlarging and increasing until now, when they hold the enviable position of being classed amongst the leading nursery and seed firms of the three kingdoms, with connections extending all over the world; their nursery grounds taking in over 120 acres, a large area of which is covered with glass, and where all sorts of nursery stock are successfully raised.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM MACFARLANEI, *n. hybr.**

This very beautiful new hybrid was raised in the nursery of Messrs. F. Sander & Co., St. Albans, and flowered in the month of August in the well-known collection of *Cypripediums* of R. H. Measures, Esq., The Woodlands, Streatham. It is, as mentioned below, the offspring of *C. calophyllum* × and *C. Spicerianum*, the latter being the pollen plant. The new plant has the size and the beautiful upper sepal of the male, but more flat, and not so revolute on the edges. The labellum, and to some extent the staminodium, look perfectly like the corresponding parts in *C. Spicerianum*. From the mother plant—

* *Cypripedium Macfarlanei*, a. hybr. (*C. calophyllum* ♀ × *C. Spicerianum* ♂).—Sepalo dorsali latissime ovato acuto carinato plicato albedo teerrime roseo superfufo basi viridi; sepalis lateralibus (septo inferiore), ovato acuto plicato pallide luteo-viridi; petalis oblongo-linearibus obtusis, margine superiore nudulatis pilosis (nec verrucosis), viridi-brunneis linea mediana crassa adjectisque utrinque tenuioribus punctulatis fuscis; labello basi viridi antice et supra brunneo margine anteriore orificii leviter emarginato margine posteriore purpureo punctulato; staminodio late cordato supra bipartito purpureo verrucis minutis atris decoro. Totus flos 4 pollices latus, 3 pol. altus, sepalum dorsale fere 2 pol. latum. Folia lineari-lanceolata acuta laete-viridia reticulata, 8–10 pol. longa, 1½–1¾ pol. lata.

C. calophyllum—the hybrid has taken the petals, which are more spreading, and the upper margin of which is less waved, and the dark reticulated leaf. The plant has been named in honour of Mr. Macfarlane, the artist. *Dr. Kränzlin, Berlin.*

CŒLOGYNE MICHOŁICZIANA, *n. sp.**

The description of this new and very beautiful *Cœlogyne* is made from a flower preserved in alcohol, with bulbs, leaves, seed-pods; and notes written at Macassar by the collector. It is to be hoped that this singular species will soon appear in this country, The flowers are snowy-white, waxy, and somewhat transparent. The labellum is on the whole of the inside, of a beautiful shade of brown, and looks as if it were lacquered. Regarding the position of this new species, it must be ranged under the tribe of *Filiferæ*, or species with very narrow thread-like petals, as for instance in *C. speciosa*, Lindley. The large, flat, smooth, cushion-like callosity laid over the whole disc of the labellum is quite peculiar. The plant may bear the name of Mr. Micholicz, the zealous collector of Messrs. Sander & Co., to whom we are indebted for the valuable material for this description. *Dr. Kränzlin, Berlin.*

SCOTLAND.

FREELAND HOUSE, FORGANDENNY.

The residence of Collingwood Lindsay Wood Esq., Freeland House, is situated about 7 miles from Perth, Forgandenny, which lies just outside the policies, being the nearest railway station. The place is a fine example of the old and the new in gardening taste, harmoniously combined. Formerly it was the property of a branch of the ancient Ruthven family, but was sold by the last resident Baron of that name to the present proprietor. The original design of the park and gardens, as is shown by an old plan still preserved, was in the Dutch style. The principal features of the original plan are still traceable within the home policies, in the form of grand old avenues of Beech and Lime trees, which are carefully preserved as ancient relics should be, even while modern improvements must of necessity be introduced. The outline of the place by the old plan appears to have been a square of about 144 acres, which was subdivided into squares of 12 acres each by avenues of trees; the intersections of the squares being worked by roundels or circles. Storms and other agencies, in the passage of time, have broken up the perfect symmetry of these features, but, as already observed, they are traceable throughout the whole of the older parts of the place, and in some cases are complete and perfect. This is particularly the case in the broad avenue, which is formed by Limes of noble proportions. The breadth of this avenue is 85 feet, and the length 165 yards. The trees average 100 feet in height, and in girth are fairly equal, one of the largest being, at 5 feet from the ground, 11 feet 1 inch. The centre of the avenue was formerly laid out as a flower garden in the Dutch style, but now forms part of the main approach to the mansion from the south. At the northern end of this fine avenue, entrance to the old kitchen garden is obtained.

* *Cœlogyne Micholucziana*, *n. sp.*—Pseudobulbis subtetragonis, 2–3 pol. altis, 1½ pol. diametro; foliis 2 obovato-lanceolatis acutis, 5 nerviis; racemo bifloro 10 pol. longo outaote; bracteis angustissimis convolutis ovarii longioribus; sepalis dorsali oblongo-ovato acuto, lateralibus acquilongis angustioribus omnibus basi cucullatis; petalis acquilongis multo angustioribus linearibus acutis, labelli lobis lateralibus erectis, ½ totius labelli aquantibus antice rotundatis obtusis intermedio latissimo lineari antice retuso apiculato per totum discum callo laevi et apicem versus lineis 3 convergentibus instructo; gynostemio sepalis dorsali fere acquilongis eique adpresso curvato supra incrassato, anthera plana, rostello latissimo; capsulae hexagonae 3 pol. longae, alis manifeste proslitentibus.—Totus flos albus, sub pellucidus, callis labelli et pars interior loborum pulcherrime brunneus verrucosus.—Qu. Nova Guinea detexit Micholicz, v.-cl. Domini, F. Sander collector sedulus. *Dr. Kränzlin, Berlin.*

ROBERT LINDSAY,
Curator, Royal Botanic Garden.

T.
The Most Noble

JOHN DOWNIE,
Member of Council.

THE ASS

In this neighbourhood are found a notable specimen of *Robinia pseudo-acacia*, about 50 feet high, the stem girthing 4 feet 5 inches at 5 feet from the ground; a massive group of Portugal Laurel of great height, open below on one side, revealing numerous stems from 2 to 3 feet in girth, which spring from the base of the decayed stumps of the original stems. Arising from the midst of this group, a remarkably well-developed tree of *Cupressus torulosa*, from 25 to 30 feet high, the stem of which at 5 feet from the ground girths 5 feet. Near by is one of the finest specimens of variegated Sycamores I have ever seen. In height it is about 80 feet, and about

Acre; a circumstance significant of the measure of appreciation of the master for the worth of his dead servant.

Passing onwards towards the present mansion, through some splendid specimens of English Yew and other well-developed trees, the way rendered still more interesting with luxuriant groups of evergreen and deciduous shrubs, we stop to drink at the Lady's Well, a refreshingly cool spring of great volume. The basin of the spring is some 9 or 10 feet by 12 feet or 13 feet, ever overflowing with pure water. It is arched overhead, and surrounded by the ruins of the old home of the Ruthvens, which was

mansion on the north, on the south by wooded slopes rising to a great height, and on the west by the avenues and groups of grand old trees which we have already passed through. To the north-east a very fine view is obtained from the lawn of the Kinnoul and Moncreiffe Hills, both of which form beautiful features in the surrounding landscape. Grouped at one side of the lawn are promising specimens of some of the more rare Conifers and choice Hollies, *Cedrus atlantica glauca*, *Sciadopitys verticillata*, *Abies lasiocarpa*, and others, though young, are full of promise of attaining good old age, and fine dimensions.

FIG. 37 — PRINCES STREET GARDENS. (SEE LEADER)

the same dimensions in the spread of the top, notwithstanding it is somewhat confined by surrounding trees. The stem girths about 9 feet.

The family burying-ground, formerly the Melon ground of the old kitchen garden, next engages attention. It is an ample rectangular space in grass, surrounded by a low wall, and embosomed among trees and shrubs. Fittingly secluded and unobtrusive, this hallowed spot has nothing of funereal gloom either in its surroundings or internal features. The remains of the late James Routledge, thirty-one years gardener to Mr. C. L. Wood, find a resting-place in one corner of this private God's

destroyed by fire in 1750. The water was formerly credited with medicinal virtues, but its chief value in troublous times in which the Ruthvens had a full share, would be its potency in enabling them to resist a long siege. If they had plenty of bread their water was sure, and within the walls of their stronghold.

Hitherto the view of the visitor has been bounded on all sides by the magnificent trees forming the various avenues, but a short walk from the ruins of the old house of Freeland ushers him on the lawn by the south-west side. The lawn is a spacious clearing of several acres in extent, bounded by the

An avenue of Beech extending from the west end of the house northward might appropriately be named the Gothic avenue, so much does it resemble the architecture of the aisle of a gigantic cathedral. The trees, which have perfect, clear, straight boles of great length, are from 110 to 120 feet in height, and the girth of one of the largest at 5 feet from the ground is 11 feet 3 inches.

The Den, a valley which separates the new kitchen-garden from the house, is a beautiful and interesting feature of the place. Grassy banks, grand old timber trees, groups of shrubs, and bold clumps of Delphiniums, Aconitums, Foxgloves,

hardy Ferns, and other strong-growing herbaceous plants are the components of the adornment of a very pretty winding glen, through which runs the overflow from the Lady's Well. Notable among the finer trees were an *Abies canadensis*, 40 feet high, with ample spread of top; grand English News; a silver Fir, girthing 11 feet 9 inches at 5 feet from the ground; a Beech which girths 15 feet at the narrowest part of the bole, swelling immediately above and breaking into eight huge limbs, the height being about 100 feet, and the spread of the branches, 106 feet; and a grand specimen of *Quercus cerris variegata*, girthing 11 feet 10 inches, 84 feet in height, and 88 feet spread of top.

THE NEW KITCHEN GARDEN

is approached by a handsome iron bridge which spans the Den. It is about $2\frac{1}{2}$ acres in extent, with a good southern exposure. The walls are well clothed with the usual kinds of hardy fruits. Plums, Cherries, and Apples were bearing fair crops. Pears do not, it appears, succeed well as a rule, and the same has to be said of Apricots. Small fruits are plentiful, but few of these, except Strawberries are grown here, the bush fruits and standard Apples being grown chiefly in the old kitchen garden, a considerable distance off. A fine range of glass, recently erected by Messrs. Low & Sons, Edinburgh and Manchester, extend the whole length of the north wall of the garden. Entering the range by a Rose-house planted eighteen months ago, we pass through two Peach-houses of considerable size; good crops, considering the comparative youth of the trees, being carried in both houses. Then follow four vineries, all bearing fine crops; one house of Black Hamburgh just finished colouring, being remarkably fine in colour and in quality. In the later houses, the crops, though heavy, gave indications of finishing up in an equally satisfactory manner.

ORCHIDS.

Of these there is an excellent selection being brought together. Mr. Sharp, under whose management this place is, is not only a thoroughly capable all-round gardener, but he is a specialist in Orchids. He is the Mr. Sharp who for twelve years prior to his entering on his present charge was gardener to Mr. Curle, at Prior Wood, Melrose, whose collection of Orchids is one of the best in Scotland at the present time.

In the warm section, *Vanda Sanderiana*, with two spikes on two growths, nine flowers on each, and two more growths showing flower, was a gem to begin with to anyone on the hunt for the cream of a collection. *Epidendrum prismatocarpum*, though an older acquaintance, was hardly less pleasing in the shape of a moderate-sized plant, with seven fine spikes in perfect condition. A small plant of a special variety of *Lælia elegans*, with one spike, was notable for the intense and brilliant colouring of the lip. The principal Cattleyas in flower were *C. Mendeli* and *C. Mossiae*. In *Cypripediums* the collection is rich in good things. A nice plant of *C. Lawrenceanum* showed nineteen scapes in perfection; *C. barbatum nigrum superbum*, a remarkably dark-lipped form, showed twenty fine scapes. A variety of *C. niveum*, as nearly pure white as may be, was showing a few flowers. Others in flower in this section were *C. Stonei*, *C. bellatulum* and *C. grande*, the latter a fine plant with seven young growths. Among notable things not in flower were good plants of *Lælia autumnalis alba*, *Cattleya Warocqueana*, *Ceologyne Sanderiana*, the latter with four fine growths; *Dendrobium Cooksonii*; *D. densiflorum*, a gigantic specimen 6 feet across, from tip to tip of growths, with two or three dozen young growths rising among the old; *Cypripedium Arthurianum*, *C. vexillarium*, and *C. cananthum superbum*.

In the cool section the principal things in flower were the rather shy *Masdevallia Davisii*, a fine plant sending up many scapes, *Oontoglossum vexillarium rubellum*, thirty scapes, very fine; many

forms of *O. Alexandræ*; *Cypripedium Veitchianum*, with twelve scapes. *Masdevallias* in fine specimen plants in flower were, *M. atrosanguinea* and *M. miniata*. Perhaps the most astonishing achievement of Mr. Sharp's cultural skill were four unsurpassable pans of *Disa grandiflora*, perfect masses of luxuriant foliage and flower-spikes from 15 to 20 inches high, each pan containing from eighteen to twenty spikes. The plants were standing in the fullest exposure to the sun in a cold frame, with the air blowing through it freely. After this I had little inclination to spend much time in viewing Cucumbers, Tomatos, and Melons in the several houses devoted to them, though it is only just to say they were all of first-rate quality. H. S.

THE STRAWBERRY SEASON OF 1891.

THE Strawberry season in this district (South Bucks) was a fairly long one, and the produce generally good, although a few fruits were spoilt by rain, and a few early blossoms perished by the frosts in May; but the crop, nevertheless, was a very heavy one.

Last autumn, with the view of testing the earliness of several varieties, I planted a number of well-rooted runners on some narrow south borders. Here I may remark that to those who do not practise the plan of planting a number of plants to be treated as annuals for the earliest crop, a loss of from ten days to a fortnight in earliness of ripening over the older plants, is the certain result. The kinds grown side by side were Noble, Marguerite, Vicomtesse de Thury, Pauline, La Grosse Sucrée, and Anguste Nicaise. The first varieties coming into flower were Noble and Marguerite; these had several blossoms fully open on April 29, Vicomtesse de Thury and La Grosse Sucrée on May 2, Pauline and Anguste Nicaise being several days later. The early flowers of Noble set well, and the embryo fruits swelled much more rapidly than the other varieties, many of them having attained a length of three-quarters of an inch before the cold weather and frosty nights of May 17 to 20, and, with the protection of the foliage, escaped harm. A few flowers of this and other varieties were destroyed, but not sufficiently to materially affect the crop. The first ripe fruit of Noble was gathered on June 8, and good dishes from the 15th and onwards. Marguerite and Vicomtesse de Thury had a few fruits ripe on the 18th, La Grosse Sucrée on the 20th, Pauline and Anguste Nicaise being several days later, ripening with Sir J. Paxton. I had no complaints from my employers respecting the flavour of Noble, but the fruits were pronounced to be "large and good," and for the first crop outdoors it is a decidedly valuable variety. For the principal or mid-season supply we rely on President and Sir Joseph Paxton, the former is one of the best Strawberries in cultivation and difficult to beat, either for flavour or cropping qualities by any other, although it is rather soft and does not pack quite so well as Sir J. Paxton. Both varieties fruited heavily this season, and the same applies to Vicomtesse de Thury, grown chiefly for preserving purposes, the largest fruits being picked out for dessert use. Sir Charles Napier is grown for following the mid-season kinds, and for the latest supply Waterloo, Oxonian, and Elton Pine. The two last-mentioned are excellent late varieties, good bearers, both have fruited remarkably well this season, and we had still a few left on August 17, covering over two months outdoor Strawberry supply.

If selecting the best six varieties, I should prefer Noble, Vicomtesse de Thury, President, Sir J. Paxton, Oxonian, and Elton Pine. Rooted runners are now being planted of Noble for early fruiting next season; they will also succeed equally well if layered into pots and planted out not later than the beginning of October, if space cannot be found earlier for them. H.

PLANT NOTES.

HYACINTHUS CANDICANS.

PRONANLY few of the newer species of poplar border flowers have been more appreciated than *Hyacinthus candicans*. The long pleasing bright green leaves, and bold spikes of pendent blooms, make it a favourite wherever grown. The plant is reputed "perfectly hardy," yet when it is seen how badly even lifted and dried bulbs ripen off their previous crowns of large succulent leaves, owners have been adverse to risking their plants out-of-doors during our often severe and trying winters. I confess to have dreaded this contingency, and should therefore be glad of information as to whether plants left in the ground last winter survived. It is not improbable the remedy is worse than the risk run. Such bulbs as are taken up, owing to the cause already mentioned, are very prone to rot when potted and placed under glass for preliminary rooting and starting into growth. In my case, I have (when so treated) lost cent. per cent., though the bulbs saved were of immense size and gave great promise. That the bulbs possess great endurance is obvious, and their capacity to increase is immense. Such examples as lost their base from decay after potting, being dried upon a shelf and again inserted in soil, have rooted free from the diseased scales, and are pushing up innumerable young growths. This explains why this grand plant is sold so cheaply; beyond doubt it can be propagated as readily, if not more readily, than ordinary florist *Hyacinths*. Should any correspondent favour us by information as to the perfect hardihood of this plant, will he also say whether any survived the past winter having their badly-ripened apices fully exposed? *William Earley*.

PLACES OF INTEREST GOING NORTH.

(Continued from p. 233.)

LAMBTON.—This magnificent estate of the Earl of Durham is reached by the traveller from Newcastle by the Leme Valley Railway, the station at Penshaw being that nearest to the gardens, if that is the object to be visited. Within the home demesne one sees but little of the surrounding score or more of collieries belonging to his lordship, and only fine timber broad-walks, thickets of *Rhododendrons*, choice *Conifers*, and the constituent materials of an English nobleman's home surroundings. We wondered on seeing them, how much longer they would remain in their present beauty unharmed by the baleful fumes of chemical works and factories of various kinds. Your colliery with its one tall chimney and smouldering waste-heap, which goes on burning the small coal and pit-rubbish for a century or longer, is not so bad in its effect on vegetation, and may be endured; but with the chemical works there is no compromise possible.

Visitors to Lambton see usually only those gardens which surround and form the setting, as it were, for the numerous ranges of glass-houses in which Mr. Hunter, the head gardener, has for so many years grown those wonderful specimens of Grapes, Pines, Melons, &c., to be met with at the first northern exhibitions. Not that fruit alone is cultivated, as several houses—and some of them very picturesquely designed ones—are filled with plants in great variety. The aforesaid evil vapours are fast driving Mr. Hunter to growing Apples, Pears, Plums, Figs, Peaches, and Nectarines under glass protection. Half-span and other houses were found filled with Apples and Pears growing in 9 and 10-inch pots mostly. The trees generally were bearing good crops of clean-skinned, handsome fruits, much out of character, of course, as glass-house culture always makes them. The quality of the fruit, we were informed, was good, the best methods of treatment having been mastered, and the season is a long one—longer, in fact, than would be attainable with trees under healthy conditions, growing in the open air. Gathering commences in July, and fruit is found in eatable condition in the fruit-room in April. It is found

that great attention must be paid to the watering of these little trees up to the finishing of their fruits, meanness or grittiness often occurring, especially in Pears, if great care be not taken to afford water when it is needed. No heat is artificially applied, but the houses are shut up about 3 p.m. at this season, and opened at 7 a.m. A very long lean-to facing south is planted with Pears, as triple cordons, and exceedingly profitable it looked, loaded as each tree was with beautiful fruits. They were trained straight across the bouse from the front towards the back, and to stout wires standing at 1 foot distant from the glass. As manures, soot, lime, and artificials of some kind, but the last not largely. After a tree has parted with its fruits, it is stood outside, and in the winter it is plunged in a bed of coal-ashes.

The unusual sight to those accustomed to south-country gardening was a very nice fan-trained Magnum Bonum Plum tree, with a heavy crop of nearly-ripe fruit upon it (August 12), trained to the walls and roof of a lofty house.

Doubtless, under those conditions of warmth and air-dryness, the fruits would acquire a richness of flavour seldom reached out-of-doors in this country. The vineries are many, and the produce of the Vines with which they are planted was of great merit. The varieties of Grapes grown are Muscat of Alexandria, Black Hamburgh, Black Alicante, Gros Maroc, Gros Colmar, both on own roots, and worked on Raisin du Calabre, the latter showing no difference either in form of berry, shape of bunch, or foliage. The bunches of most of the varieties were above ordinary size, as were the berries. Some bunches of Raisin du Calabre were of enormous proportions.

Seedling Grapes have been raised in numbers by Mr. Hunter, but although many passable novelties have been met with among them, there has been nothing that is better than our old-established varieties. The colour of the new-comers has nearly always been white, even when a black Grape has been used as the pollen-parent, the seed-bearer in most of the crosses being an early-fruited American Grape. A cross between Gros Colmar has Grapes round, of a musky flavour, and thick skin. It keeps a long time. Melons are largely grown, several varieties in a house; and Figs meet with much attention.

Peaches and Nectarines have several houses devoted to their culture, and are found as fan-trained and bush-trees. The walls of the kitchen garden are still covered with well-trained Plums, Pears, Cherries, &c., whose places will in time be given over to the Gooseberry and Currant. Cherries, which fail largely on walls, owing possibly to the impinging of the chemical vapours against the walls, do exceedingly well as low bushes in the open quarters, in so far as regards the Morello class.

The many well-planted beds and borders scattered about on the two terraces on which stand the houses, contain a very large number of the usual class of bedding plants. The Wallflower-leaved Stock finds much favour, and is largely planted in lines, as is the Carnation in named varieties.

Visitors will note the remarkable cleanliness of the gardens and the excellence of the walks, a great desideratum in a rainy climate like that of Durham. The walks are covered with about one inch of a dark-coloured gravel, or pebbles of about the size of a horse bean. It is always dry and pleasant to walk upon, and does not become readily weedy.

Lambton, we may say in conclusion, shows a good example of first-class gardening carried on under unfavourable conditions; and its teaching in the matter of fruit culture would be found of great service to those who may be similarly situated.

SOUTH SHIELDS CEMETERY.

A large cemetery exists at Westhoe, which for the peculiar character of its planting, is worthy of a visit. The area is large, and is divided into long parallelograms by means of hedges of the yellow variegated Elder, which at this season of the year are at their best. The winds from off the sea hardly allow of other shrubs being planted at present, although attempts are being made

with *Hippophae rhamnoides*, *Olearia Haastii*, *Ligustrum lucidum*, and some New Zealand Veronicas; this is done but tentatively, and where the shelter from the blast is thickest. The Elder bushes are cut back to stumps; in fact, they are pollards with a stem or stems about 18 inches high, and the annual shoots are cut back to within about two buds of the old wood; this is done in the winter. Annuals are lavishly planted at the sides of the borders of Elder which face the walks, and succeed admirably. Another novelty deserving of imitation is a boldly-designed rockery, which Mr. Cowan, the superintendent, hopes will become in a year or two an admirable feature.

CANADA.

THE SOCIETY OF AMERICAN FLORISTS.

Your readers, no doubt, will be interested in the great International Florists' Convention that was held in Toronto last week. This Convention was of some importance, because it was the first of an international character, and embraced delegates from all parts of the United States and Canada. The place of meeting was the pavilion in the horticultural gardens, which were tastefully set out for the occasion. There were some 700 delegates from the United States, and between 200 and 300 from Canada. Besides the ordinary business of the Convention, there were papers read on "The Future of Floriculture in the United States and Canada," "Sub-tropical Bedding," "Aquatic Plants," "Begonias, Flowering and Foliage, their value as Decorative Plants;" "The Twelve Best Plants for Table Decoration," "Credits," "Store Trade," "Carnations to Date," and the usual reports. From a business stand-point the Convention was a decided success.

Mr. Allison, the representative of the Horticultural Department of the great Columbian Exhibition that is going to be held in Chicago in 1893, gave a glowing description of the horticultural buildings for that occasion. Plans and elevation were shown, which, if carried out, will be something wonderful. The horticulturists and plant growers of the United States are now being put upon their mettle, and are preparing Palms and sub-tropical plants for the decoration of these buildings and grounds, and on this line they intend to "whip all creation."

These conventions are doing a great deal of good, and are of a decided advantage to the trades they represent. It seems that they have a social side as well as a business one. The Canadian delegates met their brethren from the United States on their arrival at the Union Station, and conducted them to the different hotels, and saw that each of them was comfortably taken care of. The Mayor and a number of aldermen welcomed the delegates in short, neat, pithy addresses.

The ladies of the Convention were given a drive in carriages through the principal streets of the City, thence to Mount Pleasant Cemetery, and from there to Rose Hill, Reservoir Park. The ladies had a real treat, and saw the City and its many elegant private residences to great advantage.

"Let one great day
To celebrate sports and floral play,
Be set aside."

On Wednesday a grand garden party was given by Alderman Hallam, at his summer residence, Chorley Park, Rosedale, where all the delegates, together with a number of leading citizens, were invited. There are few places so near Toronto affording as fine a view of natural Canadian scenery as Chorley Park, and no one capable of more agreeably entertaining the visiting florists than its owner. These advantages were appreciated and enjoyed to the fullest extent by the visitors. Everything was arranged in real picnic style. Hundreds of Chinese lanterns hung on the trees, and shrubs and the grounds were beautifully decorated with the Union Jack, United States, German, and French flags.

The green sward was dotted over with fine specimen Palms and foliage plants, which gave the grounds a fairy-like appearance, and which blended nicely with the beauties of Nature and the landscape gardeners' art, and gave the visitors much to admire and profit by.

The music was provided by the band of the Grenadier Guards, concluding with—"Maple Leaf," "Star Spangled Banner," "British Grenadiers," "Yankee Doodle," "God Save the Queen."

A tempting banquet was provided on the grass under a handsome marquee (decorated with flags, Smilax, and Chinese lanterns), which soothed the appetites that had been stimulated by the bracing Canadian air. The table was set out with beautiful Orchids, Pitcher Plants, and choice cut flowers, supplied by the celebrated Orchid growers, Messrs. Siebrecht & Wadley, of New York.

The business of the Convention was brought to a close on Friday, and a banquet was provided in the Exhibition Park with the usual round of toasts. The ladies gave the following cordial vote of thanks:—"Resolved that we, the ladies of this Convention, desire to tender the ladies and gentlemen of the Toronto Gardeners' and Florists' Club our most cordial thanks for the kind courtesies and social favours tendered us while in Toronto.—Signed, Mrs. M. H. Norton, Mrs. Robert Craig, Mrs. J. M. Jordan, Mrs. J. M. Gassei, Miss Brock, Miss Ella Campbell Wilson." Mr. Norton, the retiring President, was then made the recipient of a very handsome silver tea-service, subscribed for by the delegates, for which he heartily thanked them on behalf of himself and wife.

The *Toronto Globe* with commendable enterprise, gave considerable space to the proceedings of the Convention, and on Saturday issued an illustrated number, giving the portraits of the leading United States florists, with short biographical sketches of each.

The Convention for 1892 will be held in Washington, and the President for that year is James Dean, of Bay Ridge, New York; first Vice-President, W. R. Smith, of Botanical Gardens, Washington; Secretary, Wm. J. Stewart, of Boston, Massachusetts; and Treasurer, M. A. Hunt, of Terre Haute, Indiana. J. H. [The Society has no exact equivalent in this country, as it is devoted solely to the commercial side of horticulture. There are about 1600 members who devote their attention naturally to the specialties which pay best without much reference to other departments of horticulture. On the present occasion, papers were read by Mr. William Falconer on "New Plants," comprising select lists of Begonias, hardy perennials, Chrysanthemums, Roses, and other popular plants. Various essays were read on the construction and mode of heating glasshouses and other subjects. Ed.]

FLORISTS' FLOWERS.

BENARY'S NEW CARNATIONS AND PICOTEEES.

MR. BENARY, of Erfurt, Germany, fairly startled English florists with that grand flower, the yellow self Germania, a pure light yellow self, of refined form and good substance, full-size, and with a well-formed calyx. It is a beautiful variety, of free growth, and should be in every garden. Other sterling varieties came also from Mr. Benary, and one of the first of our great growers to take them in hand was Mr. Dodwell, who gave florists an opportunity of seeing a few of them in 1889 at his annual great Carnation and Picotee show at Oxford. My object now is to refer more particularly to his new varieties, some of them introduced to this country in the autumn of last year; and as they are cultivated about Birmingham, I have repeatedly seen them whilst in bloom, especially at Messrs. Thomson's Sparkhill Nurseries, where first-class cultivation of the Carnation and Picotee prevails under Mr. C.

H. Herbert's personal supervision. Here, Benary's new varieties have had every chance of being seen in their true character, and it must be admitted that they are a good all-round lot.

Von Beningsen has an orange ground colour, with broad scarlet markings; a bright fine flower, with good pod, and a free grower. This is a rich-coloured variety, not so intense in the rich carmine-crimson tint as in A. W. Jones, but is distinct and fine.

William Dreer.—Bright orange ground, flaked with crimson-lake—a bright and distinct variety of good size, but with a tendency to roughness on the edge, but will find many admirers.

Stadrath Bail.—Light yellow, with rays or small stripes of orange-red and deep scarlet—a distinct fine flower.

Esmarch.—Bright cream and yellow, heavily bordered and flushed with crimson and lake—a bright, distinct, superb flower.

Frederick Wagner.—Lemon ground, heavily margined with bronzy-tinted lilac and rose—a distinct fine flower.

Von Helnholtz.—Creamy-yellow, rayed and striped with orange and mauve—a very distinct, handsome variety.

Nora.—Primrose ground, flaked with light scarlet—a very distinct fine flower, of large size and good form.

Frederick Alexander.—Cream ground, rayed and striped with scarlet, crimson, and white—a large-sized, bright, distinct, striking flower, but rather rough in the margin.

Sarony Unger.—Dark creamy-orange, striped with rich mauve—a handsome and very distinct flower, of fine form and substance; extra fine.

Professor Virchow.—Light cream, heavily clouded with bright cerise-pink, striped with pale lilac, a distinct and charming variety of good size and form.

Alegatière.—Pale yellow-edged, and rayed with carmine. A fine flower with excellent pod.

Schleiben.—Mauve, the base of the petals of an orange colour. A very distinct flower of fine form.

The above-named have all been introduced by Mr. Benary, and independent of the qualities now ascribed to them, they all have a good constitution and give plenty of "grass," and not one having a tendency to produce flowers with a split calyx. Messrs. Thomson & Co. have their own new varieties to send out this autumn, and have been growing and again testing a large number of plants of each. In the class of Picotees, known as Fancies (of which many of Mr. Benary's are types), their new variety, A. W. Jones, holds the first place; it is a grand variety, and has received some Certificates, and has a robust constitution, giving plenty of grass, and several plants placed out on a border are blooming freely, and the colours are brighter even than from the plants in pots. It has an orange-ground colour with heavy rich scarlet and crimson stripes, a true bizarre Picotee, very distinct and bright, and very fine. It is a telling exhibition flower with a good pod, and the Clove Carnation perfume. The following are also new kinds, raised at the Sparkhill Nurseries, and to be sent out this autumn.

Annie Sophia.—White ground, barred and spotted with rosy-purple, fine stout petal, good pod, and constitution; a quite distinct fancy Picotee.

Mrs. Herbert.—Light rose, wire-edged, and snowy-white ground colour, very fine petal and form. An excellent exhibition flower, of good constitution, and well-formed pod.

Blushing Bride.—Self Carnation, is a grand flower for both exhibition and decorative work, good constitution, free bloomer, the flowers on stout foot-stalks, and an excellent variety for bouquets and decoration; colour, blush-white, of full size, broad, stout petal, excellent form, and perfect pod.

William Spinks.—Rich dark scarlet-crimson self, good pod, petal, and form, and of short, sturdy growth.

C. H. Herbert.—Scarlet bizarre Carnation; has received some Certificates. It is a very fine new variety, bright in the colours, and of large size and

fine form, with good pod, and a free grower; in fact, it is such a free grower, that richly-manured soil for this variety should be avoided.

Robert Thomson.—Rose-flake Carnation; has a very broad, stout, well-formed petal, and is bright in colour, and of good form and pod. A really fine flower.

S. S. Thomson.—Pink and purple bizarre Carnation, very fine petal, good substance, and a fine flower.

Fancy Picotee, Mrs. Thomson.—Salmon ground, heavily margined with bright rosy-crimson. A lovely flower, of fine form.

Lilian.—Yellow, heavily edged and rayed with very bright scarlet, contrasting so well with the clear light yellow ground colour, and of extra fine form, good size, and capital pod. This beautiful and distinct fancy Picotee was raised by Mr. James Douglas, who sold the stock of it to Mr. Robert Sydenham, Birmingham, and it was distributed to local growers, all of whom report very highly of this flower. I look upon it as a great acquisition. Other fine seedlings, raised by Mr. J. P. Sharp, the raiser of Mrs. Sharp and Campanini, have bloomed this year, and will make their mark anon, after another season's growing. *W. D.*

WHAT BECOMES OF THE RAINFALL?

The most recent issue from Rothamsted is a small pamphlet of observations on Rainfall, Percolation, and Evaporation, with results obtained at Rothamsted over twenty harvest years—1870-71 to 1889-90 inclusive; the main portion of which formed part of a discussion at the Institute of Civil Engineers, in March last, of a paper by Mr. J. Thornhill Harrison "On the Subterranean Water in the Chalk Formation of the Upper Thames, and its Relation to the Supply of London."

As important estimates had been founded on the Rothamsted results, Sir J. B. Lawes and Dr. J. H. Gilbert thought it might be of interest to provide further data than had been already published, hence the present issue.

The appended tables show for each of twenty years, the amount of rain in inches, the percolation in inches through 20, 40, and 60 inches of soil, and the complementary amounts which represented evaporation, also the averages for the twenty years. The results are given for harvest years, that is from September 1 to August 31. As, not only is that method of computation of interest to agriculturists and horticulturists, but the authors think it ought to be adopted by those who study the question of drainage from other points of view. The results show that the average minimum drainage is in August, and that in September the amount begins to increase. If the civil year were taken, it would be found that the end of December cut the drainage in the middle of the period of greatest activity, whilst marked decline commenced with March, not April, the point of civil year division.

The advantage of having a considerable number of years, and full details, was that they were able not only to get a better average, but to study the maxima and the minima, which were of the greatest importance, especially the latter, when they came to consider what was available over a series of years.

The data shows that in 1873-4, with a rainfall of something under 22 inches, the drainage through 20, 40, and 60 inches of soil was only 5.74, 5.40, and 3.94 inches. In 1879-80, with a rainfall also between 21 and 22 inches, the drainage was 6.89, 7.39, and 6.50; whereas, in 1878-79, with a rainfall of 41 inches, the drainage was 24.44, 26.03, and 24.38 inches. In 1880-81, with a rainfall of 36.8 inches, the drainage was 22.38, 22.84, and 21.26 inches. Thus, within the harvest year, we may have little more than 5 inches of drainage, or as much as from 22 to 25 or 26 inches. Such results were of great importance to study, when considering what would be available under any given circumstances.

The details further show that, although the rainfall obviously had a considerable influence upon it, yet the amount of drainage was by no means proportional to the rainfall, but depended to a great extent upon the distribution as well. Thus, to give a very obvious example, if they had a given amount of heavy rains during the growing period, there might be no drainage at all; whilst the same quantity during the winter, when there was no vegetation and little evaporation, might give a very large proportion of drainage. The drainage was, in fact, materially affected by the distribution of rain, and the drainage and evaporation were, of course, complementary to one another. The data showed that, taking the difference between rainfall and percolation to represent evaporation, they had in two years only 12 inches of evaporation, and in several between 19 and 20 inches; so that there was a great difference in that respect also. According to the average of twenty years, with rather heavy soil, free from vegetation, it might be said that the drain-gage gave about 14 inches.

It was difficult to estimate exactly what deduction should be made for vegetation. The authors consider that the minimum amount would average 2 inches, as in the case of downs or waste-lands, where there was very little vegetation; whereas with a heavy grain-crop or good root-crop, there might be an evaporation of 7 inches or more. Taking the average of a large area around London, partly covered with vegetation, and partly bare, over a number of seasons, they thought that between 3 and 4 inches should be deducted from the 14 inches of percolation, so leaving 10 or 11 inches. Supposing the average rainfall to be about 20 inches for the twenty years, that left about 10 or 20 inches for evaporation, both by the soil and by evaporation. *J. J. Willis, Harpenden.*

BELGIUM.

GRAND GENERAL EXHIBITION AT LEDEBERG, GHENT.

This Exhibition was remarkable, alike for the quantity and the quality of the various exhibits, and the examples of good cultivation which most of the groups afforded. Mr. Laing, of Forest Hill, represented English horticulture in the position of vice-President of the Jury; Mr. Arthur Veitch filled the post of general Secretary, and a number of English horticulturists, among whom were Messrs. Manning, Outram, and Shuttleworth, formed part of the jury, the President of which was M. Chantin, of Paris, the senior horticulturist.

General Competition.—The prize (a work of art valued at about £8), for the best miscellaneous collection, was awarded by acclamation to the Society Louis Van Houtte, *père*, of Ghent; the excellent specimens included an *Anthurium Veitchii* with twenty leaves, from over 3 to 4 feet 6 inches in length; *Dieffenbachia imperialis nobilis*, nearly 5 feet high, with six leaves about 3 feet in size; *Pandanus Van Houttei*, a single specimen of a very rare species; *Anthurium Warocqueanum*, with seven leaves about 4 feet long, deep green, and velvety; *Philodendron Schottianum*, over 6 feet through; *Anthurium Gustavi*, with five leaves, and over 3 feet through; *Alocasia Pucciana*, with five stems over 3 feet long; *Anthurium cristallinum*, 5 feet 8 inches wide, with about twenty leaves 19 inches wide; *Theophrasta macrophylla*, a remarkable plant, with a stem over 6 feet high, and with a crown measuring about 6 feet in diameter; *Phyllotanium Lindeni*, about 5 feet in diameter, with at least 200 leaves.

The 1st prize for twenty-five (miscellaneous) greenhouse plants (a first-class work of art), was awarded for a remarkable collection, sent by M. Jules De Cock, of Ledeborg. M. Edmond Van Coppenolle, of Meirelbeke, won the 1st prize, with a splendid lot of ornamental plants, including *Anthurium Leodiense*, with five flowers and seventeen leaves over

2 feet long; *Aralia Chabrieri*, 6½ feet high, furnished to the base; *Philodendron corsianum*, a fine plant with sixteen unusually large leaves; *Pothos macrocarpa*, a rare specimen; *Musa ensete*, nearly 3 feet high; *Cyathea dealbata*, with thirty large leaves; *Zamia horrida*, and *Philodendron pertusum*, very fine, with fourteen leaves measuring over 3 feet; and other plants. A very fine collection of twenty-five flowering greenhouse plants from M. Van Driessche-Leys (1st prize, a work of art, awarded by acclamation), included some very fine plants, amongst others, an *Hydrangea*, 6½ feet high, covered with bloom. The greenhouse plants with variegated foliage from Louis Van Houtte were magnificent, especially *Cyanophyllum magnificum* with a dozen leaves; *Dieffenbachia imperialis nobilis*, equally fine and taller; *Alocasia Thibauti*, *Phyllotanium magnificum*, *Schismatoglottis Rœbelini*, and *Alocasia macrorrhiza*, a peculiar plant, the foliage of which is half-white and half-green.

New Plants.—The firm, Van Houtte, showed among other plants, *Alocasia Leopoldi*, *Dianthera bullata*, *Acrostichum decoratum*, a very curious species of *Pandanus*, with leaves identical with those of *P. utilis*, but arranged in fan-like form. *Pteris Victoriae* from M. Louis Desmet, obtained the prize offered for a flowering plant which should be best for market cultivation. M. Desmet Duvivier, with his *Anthurium Duvivianum*, bore away the palm for a flowering plant.

Special Exhibits: Orchids.—A fine collection of seventy-five Orchids from M. A. A. Peeters, Brussels, won all votes. Amongst fifty-six species and varieties, the most noteworthy were *Vanda cœrulea*, with very fine flowers; *Cattleya Warszewiczii*, with twenty-two blooms; *Cattleya guttata Leopoldi*, bearing a raceme of forty-eight flowers; fine plants of *Cattleya superba splendens*, *eldorado*, *eldorado alba* and *porphyrophlebia*; *Vanda Kimballiana*, the pretty little *Oncidium præstans*, and a fine variety of *Oncidium Gardneri*; *Cypripedium regale* and *Seegerianum*, *Brassia maculata*, strong plants of *Lælia crispa* and *elegans prosiata*; other much-admired specimens were *Miltonia spectabilis* and *Mooreiana*. In addition to this fine collection, there were shown *Odontoglossums* by M. Ch. Vuylsteke, of Loochristy; *Cypripediums* by M. Jules De Cock, and also a remarkable novelty, *Cypripedium luteo-pictum*.

Palms.—Two unusually good collections of twenty-five large Palms—one from MM. Desmet Frères (1st prize), and one from the firm of Van Houtte, included specimens in full vigour and beauty. In the group from the first-named exhibitors each plant was a specimen of perfect cultivation; the following were included:—*Phoenix rupicola* (the finest and best plant), the splendid *Bismarckia nobilis*, in full health and strength; fine plants of *Kentia*, *Areca*, &c. In the collection from M. Van Houtte were included an *Areca sapida*, nearly 20 feet high, and of equal diameter, with twelve leaves—a unique and splendid specimen; *Licuala grandis*, over 6 feet high, very rare; *Phoenix tenuis*, also over 6 feet in height and breadth; *Pritchardia pacifica*, *Cocos Yatai*, *C. campestris*, &c. The twelve tall Palms from M. Edm. Van Coppenolle were most remarkable:—*Livistonia Hooqendorpii*, unusually strong and beautiful; *Cocos Gartneri*, with sixteen beautiful and smooth leaves; *Kentia rupicola*, with twelve leaves, and over 16 feet high; *Thrinax Martiana*, *Areca Baueri* and *aspida*, *Rhapis flabelliformis*, with about a hundred stems; *Glaziova insignis* and *Phoenix pumila* were noticeable. We must also mention the twelve Palms suitable for gardens during the summer from M. L. Spae-Vandermeulen, of Ghent; the new Palms, from M. Jules De Cock; and the *Washingtonia robusta*, from the same exhibitor; *Chamerops hystrix*, from M. Edm. Van Coppenolle, a rare plant of exceptional merit; the fine *Brahea dulcis*, from M. Ad. D'Haene; the fine pair of *Phoenix*, from M. Jules De Cock, a pair of *Cocos chilensis*, from Louis Van Houtte, with trunks 6½ feet in circumference, and about thirty leaves; *Cocos insignis*, from M. Van Coppenolle, and a fine pair of *Corypha australia*, from the Ghent Horticultural Society.

Ferns.—We must specially notice the fine Tree Ferns from MM. D'Haene and Desmet Frères; the herbaceous greenhouse Ferns from MM. Walleri et Fils, and M. Alb. Rigouts; *Gymnogramma chrysophylla gigantea*, over 3 feet in height and diameter; *Nephrolepis rufescens tripinnatifida*, from M. Alex. Dallièrè; six *Platyceriums*, from M. Jules De Cock; pretty *Adiantums*, from M. L. Spae-Vandermeulen; and, finally, the open-air Ferns, from MM. Walleri et Fils.

Cycads.—The collection from MM. Desmet Frères, surpassed any hitherto shown by this firm. The specimens were of unusual vigour, and all had developed close crowns of new fronds. Noteworthy were:—*Zamia caffra*, *Zamia Van Geerti*, *Macrozamia Denisoni*, *Zamia Vroomi*, and *Cycas undulata*. The Cycads from M. de Ghellinck de Walle were also very remarkable; the new *Cycas Shepherdii*, from MM. Desmet Frères, which unfolded its crown of twelve fine fronds in Europe for the first time, excited universal admiration.

Aroids.—A collection of twenty-five Aroids, from the firm Van Houtte (1st prize a work of art), was composed of specimens in full beauty. The fifteen plants of *Anthurium Scherzerianum*, in bloom, from M. Louis Desmet, was a triumph of horticulture. The 1st prize (a work of art) was awarded for this group, with the commendations and congratulations of the jury. Plants of *Lilium Harrisii* and *auratum*, of *Cocos Weddelliana*, and *Adiantum cuneatum*, veiled their bright colours with graceful foliage, the brilliant scarlet spathes producing a striking effect. The twelve specimens of *Anthurium Scherzerianum* from M. Vervsène-Verraert, of Ledeburg, and the flowering varieties of *Anthurium* from MM. Jules De Cock and Louis Desmet, were exhibits deserving the highest praise. The hybrids of *Anthurium Andreanum* from M. Louis Desmet included some unusual varieties, such as *Madame Louis Desmet*, *Président D'Haene*, and *Atrosanguineum*. *Anthurium Andreanum*, well-grown, and from the same exhibitor, bearing twenty flowers, was certainly an unusual sight. Among a number of fine spotted and marbled *Anthuriums* from M. Louis Desmet, true to the type (which is an unusual thing), we must mention *Professeur Ch. de Bosschère*, *Mme. Bertrand*, *Mme. Arthur Desmet*, *Mme. Bernard Spae*, *Secrétaire Delaruye* (a new colour), and *Modèle*. *Anthurium Veitchii* (1st prize for good cultivation by acclamation), from the firm Van Houtte, is a unique example nearly 10 feet high, and requiring a space of over 43 square feet.

Greenhouse and hardy plants and *Roses* were all well represented. The first *Prix d'Honneur* (the King's Medal), was awarded to the firm Louis Van Houtte, père; the 2nd to M. Jules De Cock; the 3rd to MM. Desmet Frères; the 4th to M. Van Coppenolle. *Ch. de B.*

NURSERY NOTES.

ANNUAL ASTERS AT EYNSFORD.

GAZING with a somewhat dreamy air at a few Asters in pots, sent up from Chiswick to the James Street Drill Hall the other day, Mr. H. Cannell sententiously remarked that he had a grand lot just then in bloom at Eynsford, and invited me to go and see them. The invitation was too tempting to be declined, and accordingly, a few days later I found myself with my energetic host, standing out on the side of the hill which slopes southwards to the Eynsford valley, looking upon what can be truly described as one of the finest shows of Asters I have seen. As under the force of the prevalent strong wind, the rich masses of coloured flowers surged to and fro, sometimes in broad sunlight, sometimes in shade, it was not possible to refuse a warm tribute of admiration for a most beautiful as well as brilliant floral spectacle. There are large breadths of Quilled, of Victoria, of Pæony-flowered, of Pompon, of Emperor, and other sections, in mixed colours, and very beautiful they are, because of the bizarre colour-

ing found in some twelve to fifteen diverse forms or markings thus interspersed; still further, the mixtures are of special interest, because these include some lines or markings not found in the selected colours, and thus furnish the ground-work of further selections of special merit. Still, the best effects are found in the big blocks or masses of colour, which hundreds of plants, all of one hue, produce. Because rather the earliest perhaps, the Pæony, or incurved-flowered, seemed, at the time of my inspection, to be the most brilliant, because the most fully in bloom; and some of the colours were, indeed, glorious under the sunlight—so telling, in fact, as to almost beggar description. Although growing, as it were, under field culture, and out on the exposed breezy hillside, yet the flowers are in all cases of splendid quality. I have never seen better under ordinary culture, or plants more profusely blooming.

Mr. Cannell is growing these Asters for seed production, and without doubt he starts in the production of home-raised seed with very fine strains, the flowers being as perfectly double as well they can be. As evidence of the variety, it may be mentioned of the Pæony flowers: Blue and white-striped; claret-purple, an intensely glorious colour; rosy-carmine, singularly beautiful; fiery scarlet, a grand colour; magenta, also very brilliant; lilac, dark blue, light blue, pure white, crimson and white striped, violet and white striped, and rosy-crimson; a splendid selection in twelve diverse colours or markings. Next came the very popular and sturdy-growing Victorias. These all have flattish reflexed flowers, and almost always take the 1st place at exhibitions. Some of the tints on these resemble those of the Pæony-flowered, but still seem diverse, because seen on the obverse sides of the petals. The deep hues of the Pæony flowers are doubtless largely due to the fact that only the under-sides of the petals are seen. In the Victorias the most striking colours were light blue, rose, flesh, white, violet, dark blue, peach, crimson, lilac, dark blue with white stripe, and rose with white stripe. The bulk of the plants in this section ranged from 13 to 14 inches high. In all cases also the respective colours were very true. Singularly charming, whether grown in the open, or in pots, or to furnish flowers for cutting, are the imbricated or pointed-petalled pompons. The flowers are of medium size, borne on fairly long stems, and the plants bloom most abundantly. More delightful Asters for bouquets can hardly be conceived. In the section are also some very glorious colours, such as blood-red, rosy-carmine, deep reddish-rose, violet, and deep blue; also charming are pure white, rose and white stripe, crimson and white, and blue and white.

The Mignon Asters specially claim attention, because of their adaptability to furnish cut flowers. The blooms are of the most perfect reflexed form, and of medium size; the plants are about 14 inches in height, and bloom profusely, furnishing a supply of flowers over a long season. The most striking colours in these are pure white, carmine, blue, red, and purple; a new variety named Snowball, very perfect in form, is but a selection from the white Mignon; still, it is a most pleasing variety, and grown for late-flowering in pots under glass, will rival white Chrysanthemums in the market. There is here at Eynsford a very early bloomer, the flowers semi-quilled, or hedgehog-like, named Pride of the Market, that is one mass of bloom. It should, by those who want white flowers early, be sown to precede the white Mignon. The dwarf Chrysanthemum, or market section, is also well represented. Some of these, the Fiery Scarlet, for example, make wonderfully effective bedding plants. The blue, purple, crimson, white, and deep scarlet forms are grown by myriads for lifting into pots for the London market, and Mr. Cannell is well provided with a fine strain. Giant Emperor Aster carries one huge reflexed flower only in several colours; whilst thus lacking the effectiveness found in branching Asters, this variety produces huge flowers for exhibition. The Washington is also a large-flowered Aster, flattish in form, and found in several colours. There are still the somewhat fine large-petalled forms now

known as the Cornel Aster, the best-known type of which is pink with white stripe, but pale blue and peach are also found in the section. The old crown-flowered, or Cocardeau also merits notice because of the white crowns or centres to the flowers. A very striking incurved Aster is Jewel, because the flowers are so perfectly ball-like that they exactly resemble a pink incurved Chrysanthemum; indeed, it would need keen discrimination to detect the difference. The Shakespeare Asters include some odd dwarf branching forms, one of which, almost black with white centre, is novel and pleasing; whilst many of this section are quaint in colour, or in the markings of the flowers, yet they fail to emulate altogether the exceeding brilliancy and beauty found in the older and more justly popular sections. Such is the wealth of material for note, taking both vegetables and flowers found at Eynsford, that great self-denial is needful to check too much scribbling. Away on the top of the hill-side, vegetables, such as Onions, Carrots, Parsnips, Celery, Peas, Beans, &c., with various varieties of the Brassica family, are seeding well, or have done so, and are now being harvested, or cleared out. The rich, quiet valley and the lofty breeze of hill sides, enable Mr. Cannell to find sites for all classes of flowers and vegetables, and from the upper heights we look down not only upon Asters, but also upon Marigolds, Lobelias, Nasturtiums, Antirrhinums in several distinct and rich colours; Stocks and Annuals, both hardy and tender, are in rich and varied profusion. As we are driven back by the narrow lanes, through a beautiful country, as fertile as beautiful, we are taken through a lane the sides of which are literallyavenued for a mile long with Damsen trees heavily laden with fruit. What would be the fate of both trees and fruits were a score or two of town-dwellers, "Arrvs" and "Arriets" of the alleys of London turned loose amidst this peaceful scene of plenty, all too well know. May this place never know of such an irruption. Back to Swanley, passing on the way that monster town of glass which Mr. Ladds has erected there, and which is of itself enough to astonish all not conversant with the Kent market trade, by extensive tree-fruit orchards, by hundreds of acres of Strawberries or Currant bushes, again to Mr. Cannell's own Kentish wonder, his literal home of flowers, where just now, excelling all others, the Begonia presents, not only outdoors but in house after house, a spectacle so beautiful and extensive, as to almost take one's breath away, and lead to wonder after the Begonia has satiated us, what other flower can possibly hope to excel or succeed it. Others may, indeed, have grand collections of Begonias, but at least Mr. Cannell has just now one of the finest and most brilliantly beautiful collections, in wondrous variety of colour, both double and single, ever seen. A. D.

VEGETABLES.

LATE BROCCOLI, VEITCH'S MODEL.

The importance of planting this crop in different parts of the garden was never more apparent than last season, as on a large plot of land, with several late kinds, we only lost a single head; they were well protected, the stems being well covered, and the plants checked late in the autumn by heeling over. A few late plants on a north border gave us some nice heads; though small they were most acceptable, owing to the great dearth of green vegetables in the late spring. I know that the large plot of any winter vegetables looks better to the eye than a lot scattered about, but it is often the case that one saves a crop by planting in different places; it is often an advantage in other ways, as the gardener can utilise vacant spaces as cleared. The best Broccoli I have grown for late cutting is Veitch's Model; it is excellent in every way, and was the only one we saved last winter, though we lost all the early-planted of this variety; but those planted late, owing to the ground being occupied with other crops, gave us small heads. The plants, very dwarf ones, were drawn from the seed-

beds, and transplanted, which greatly helped them to withstand frost, as they had no stems showing above the ground-level. This variety, being of a dwarf habit, its leaves protect it in a great measure. I also plant on poor, hard ground. I find it best to plant two or three lots, as then no difficulty exists in prolonging the Broccoli season till the Cauliflowers come in. G. Wythes, Syon House.

THE NATIONAL CARNATION AND PICOTEE SOCIETY.

The annual report of the above for 1890 is before us, from which we learn that the Society has enjoyed a prosperous year and greatly increased support, many new members having joined it. The exhibition and conference at the Royal Society's Gardens at Chiswick, was, as regarded the exhibition, the best hitherto held. Death has removed during the year two of its most prominent and active members—James Mackintosh and Shirley Hibberd—and the report contains expressions of regret and condolence.

The committee, desirous of meeting a long-felt want, invited the leading growers of Carnations and Picotees to send in lists of the best varieties in their respective classes. The lists have been arranged in order of merit; the variety obtaining the greatest number of votes being placed highest on the list:—

VARIORUM.

THE POSSIBILITIES OF BOTANY. — Professor Goodale, in his address as the retiring President of the American Association for the Advancement of Science, in speaking of the possibilities of Economic Botany, said that the methods of improving plants are already known so well that "if all our present cereals were swept out of existence, our experiment stations could probably replace them by other Grasses within half a century. New vegetables may be reasonably expected from Japan, which has already sent us many choice plants in all departments, and it is likely that some of our present vegetables, which are now much neglected, will come into greater favour and be improved. The fruits of the future will tend more and more toward becoming seedless, just as Pine-apples, Bananas, and some Oranges are now. There is no good reason why we should not have seedless Raspberries, Strawberries, and Blackberries, and also raise, by cuttings, Plums, Cherries, and Peaches, free from stones.— Garden and Forest.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

The heavy gales of late have greatly lessened the crop of Apples on trees in open places, and much fruit is, in consequence, spoiled, fetching but very low prices. Where the best of the fallen ones were packed and sent to the markets, the prices per bushel were so miserably low that they did not pay for the labour of collecting and packing the fruit. Young trees in bearing should have the stakes and other fastenings examined, making them secure. Trees left to be rocked by the winds will, on heavy lands, soon acquire funnel-shaped holes round the stems, which, holding water, cause the trees to become stunted. The best croppers this season are the following:—Lord Grosvenor, a fine fruit for kitchen use, fit for using in the middle of the month of August; the tree is very free bearing, robust, free of canker, and, with us, surpasses Lord Suffolk, which is rather tender, and liable to canker. Gascoyne's Scarlet is a beautiful red-cheeked Apple, fit either for dessert or cooking; the fruit is large, and the tree a free grower, sometimes bearing to the ends of the shoots. Ecklinville Seedling is one of the best croppers, succeeding in almost any form, and it should be extensively grown. Duchess of Oldenburgh and old Nonsuch are both of them good, and regular croppers, and not unlike each other. Fillbasket is a regular and a free bearer, fruit large, and the tree hardy and vigorous. Stirling Castle is invaluable anywhere, having large fruit, and is a constant cropper; one of the most useful market fruits grown. Lane's Prince Albert is an excellent bearer, which crops very regularly; the growth of the tree is satisfactory, and the fruit keeps well. Northern Greeniog, one of the best keepers, is another regular cropper, and the fruit cooks well, but being green-skinned, it does not sell well. Golden Spire is a long conical fruit of good quality, and bears freely. Worcester Pearmain crops well, but it has the drawback of being liable to attacks of the grub—the caterpillars of *Carpocapsa pomonella*. Cox's Pomona seldom fails to produce fine crops of its bright-looking fruit. There are many other good varieties of Apples for general use, but those which I have mentioned have been the best at Mereworth for a number of years.

Ribston Pippin, Blenheim Orange, Cox's Orange Pippin, King of the Pippins, Summer Goldings are the finest dessert Apples. With regard to gathering fruit, it is the best plan with all but the earliest kinds to pluck the fruit when the kernels have begun to change to brown; if gathered before that change has occurred, the fruits shrivel and flavour is deficient. Now is the best time for intending planters to visit the fruit nurseries, for the purpose of seeing the fruits whilst growing, and note the varieties best suited for various purposes, so that no confusion may arise when giving orders for trees, which should be done early in the season.

Some good and useful Pears are William's Bon Chrétien, Triomphe de Vienne, Madame Treyve, Autumn Nelis, Emile d'Heyst, Wiuter Nelis, Pit-maston Duchess, Marie Louise, Doyenné du Comice, Jersey Gratioli, Louise Bonne de Jersey, Josephine de Malines, Zephirin Gregoire, all of which are regular croppers, and the fruits of good quality.

With bright and sunny weather, no time should be lost in bringing up arrears of work, the hoe being kept in constant use to destroy weeds. The fruit-room should be cleaned out, shelves scrubbed, and the walls whitewashed, and everything got in readiness for fruit gathering. *H. Markham, Mereworth Castle, Maidstone.*

THE KITCHEN GARDEN.

POTATO CROPS.—All early varieties which have been left in the ground to mature for planting purposes and storing, should be lifted as soon as the skins are set, choosing a dry day for the job. The late heavy rains will cause these early kinds to start into growth if the tubers are left any longer in the soil. Sort out the tubers proper for planting purposes, and when these are dried place them thinly on the floor or shelves in some dry and cool place. The tubers to be eaten should be stored in a cool, dark place, or they may be clamped in the open ground; the latter being preferable. Do not put too large a bulk together, or heating may take place; and to allow moisture to escape upwards leave a few holes near the apex of the clamp, to be closed with a handful of clean straw after a week has elapsed. The practice of leaving Potatos in the ground after the haulm has died down, certainly causes loss, and all the matured crops are the better for being dug up when ready. The disease among the late and main crop Potatos has become very apparent of late in the tops. I find it best to remove the haulm entirely, pulling it up with the hand, by the feet being kept close together on either side of the stem so as not to drag the tubers out of the earth; these latter may be left till the skins will no longer rub off on being touched with the fingers. The haulm should be at once carefully cleared off and burnt.

CARDOONS.—These plants should have good soakings of manure-water, and then some of the earliest plants tied up to blanch, which is done by tying the leaves close together with matting, then fastening stout brown paper in two or three thicknesses round them, and over this a covering, 2 inches thick, of straight, clean straw, tied over all. The plants should be kept erect by means of stakes. Some gardeners make use of haybands for blanching Cardoons, but these collect too much moisture, which discolours, and causes the decay of the stems. Two pieces of board may be so placed as to form a pent-house, and thus prevent water reaching the hearts of the plants. Only a few plants should be tied up at one time.

ONIONS, ETC.—The early main crop may now be pulled and dried in an airy shed or in cold frames, rather than in the open air, this year. Late crops are still green, with large, thick necks; these must be laid with the leaves bent over, which is readily done with a long rod, or by the hand. It should not be forgotten that such bulbs will not keep well, if means be not taken to ensure their ripening. Beds of Onions sown about a month ago should be weeded with small hand-hoes. In any case, weeds must be destroyed in some way, or they will become so large that it will be impossible to get rid of them without disturbing the Onions. Take every opportunity of the soil being dry to forward the earthing-up of early Celery. *C. J. Waite, Glenhurst Gardens, Esher.*

FRUITS UNDER GLASS.

STRAWBERRIES.—Those potted early from strong runners will now be full of roots, if 5-inch pots were used; they will now take weak liquid-manure to assist in building up strong crowns. The pots will also require frequently moving to prevent rooting through; also more room as growth increases, since crowding causes weak growth and elongated foliage. The runners must be taken away, going over the plants weekly, and removing useless crowns or offsets, as some of the small early-fruited kinds often throw up numerous offsets, and these tend to produce small fruits if left; indeed, if forced hard, they often only produce weak foliage. With little sunshine and much rain, newly-potted plants in larger pots will require careful management, to prevent too much water at the root before good growth has been made. We have been obliged to lay our plants on their sides for days, owing to the heavy rainfall, as, no matter how well drained, they often suffer with too much moisture before the pots are well filled with roots, and thus become sour. A good open well-drained position is of great importance in such wet seasons. I find when the plants are placed along the side of a gravel walk, with a thin layer of ashes to stand on, they frequently suffer in wet weather, and worms find their way

into the pots. I prefer strips of wood from 4 to 6 inches wide to stand the pots on, as they do not root through, and the path is not injured. Strips are soon put down and taken up, and cost little; when on ashes, it should be of a good thickness, and as firm as possible, placing a top layer of fresh ashes yearly, to prevent weeds and moss growing.

POT-VINES.—If, as advised a month ago, these were removed and placed in frames with free exposure, they may now be removed to a south wall in the open, taking care to well secure the canes to prevent the wind twisting them about; any injury to the outside bark at this date, though not visible at the time, will show itself when the sap begins to rise when forcing is commenced, and bleeding will cause much injury. If any doubt exists as to thorough ripeness of the canes, it is best to err on the right side, and keep them under glass for a time till properly matured. When placed in the open, the pots should be covered with litter, or a board in front to prevent the roots suffering, as we often get bright sunshine for some time in the autumn. Any pruning or shortening back should not be delayed after this date.

Late houses with the roots outside must be covered with some material to throw off excessive moisture. During the last few weeks much rain has fallen, causing some injury if not covered, Madresfield Court and other varieties cracking. We use galvanised corrugated iron in 12-foot lengths, 3 feet wide, and it answers admirably; it is also useful in the winter, as we place a good thickness of dry leaves over the borders and the iron on the top to prevent the leaves being blown about and to keep them dry. It is much better than manure or litter, as the latter keeps the border in a wet, cold condition. Houses that have been cleared of fruit, and the wood thoroughly ripe, may be gone over and the long growths shortened, this will admit more light and air, and plump up the buds for next year. *G. Wythes, Syon House, Brentford.*

PLANTS UNDER GLASS.

STOVE PLANTS, YOUNG STOCK.—Cuttings of the different kinds of stove flowering plants, which were put in a short time back, will now be ready for potting off, as it is always advisable that the cuttings, so soon as they are well rooted, should be potted at once, so that the young plants may have time to get established before the winter. It is a great advantage to strike cuttings of many kinds of stove plants in the late summer, as they then gain sufficient size and strength to admit of their blooming better and much earlier than if struck in the spring. Young stock of such plants as Clerodendrons, both the climbing and bushy varieties, Allamandas, Dipladenias, and Francisceas, may be grown on slowly during the winter. It is not at all necessary that they should rest, as is sometimes advocated; they are much better when kept moving gently until the spring, and it will be found that they will grow more freely when subjected to more heat. Place the plants during the winter in a light position, and do not allow the temperature to fall too low. Young stocks of Crotons, Dracenas, Aralias, &c., which were propagated at the same time as the above, will now require repotting. Use smaller pots than it would be advisable to give them earlier in the season. A good compost for these plants is a sound loam, adding sufficient sand to keep it open.

When the young stock of Crotons, which are required to form specimens, have started into growth, they should have their points pinched out, so that they may be well furnished with side-shoots from the bottom, as many of the new introductions are inclined, more or less, to grow tall. Keep these growing slowly through the winter, by allowing them sufficient warmth, and a light position near the glass.

SCUTELLARIA MOCCINIANA.—Cuttings of these put in at the present time will make useful decorative plants for flowering during the winter and spring months. In taking off the cuttings from the old plants, choose the most robust of them, as they in their turn will make the strongest plants. Either insert the cuttings singly in small pots, or three or four round the edge of a 4-inch pot, using a sandy compost, afterwards plunging them in a propagating-frame. When the cuttings are well rooted, which will take about three weeks, pot off at once into 5-inch pots, using a compost of good loam, leaf-mould, and sand, in sufficient quantity to keep it porous. When well established, pinch out the centre of the shoots, which will cause side-shoots to break, and when they have grown some three

weeks, take the point out of them; these will give sufficient shoots to furnish the plants. Pot off finally into 6 or 7-inch pots, using a similar compost to that recommended above.

From the time the cuttings are rooted until they are in bloom, keep them in a light position near the glass, syringe freely, and assist with weak manure-water when the pots are filled with roots. Remove the plants to a cooler house when in bloom, and they will last for a considerable time.

ALOCASIA MACRORHIZA VARIEGATA.—When well-grown, and the foliage well-coloured, this is undoubtedly a most beautiful plant. It may be increased either at the present time or in the spring; old specimens generally have a quantity of suckers springing up from the base. Those which have all white foliage should be discarded, as these cannot grow into plants; but choose those that are well-coloured, and have four or five leaves. Take them off with as many roots as possible, place them singly in pots, according to the size of the young plants; 5-inch pots will be large enough. Two parts good rich loam to one of decayed manure and sand will form a suitable compost for them. After they are potted, place them in a propagating frame for several weeks, until they begin to throw out fresh roots, and to keep the leaves from flagging, afterwards giving them more air. Allow plenty of drainage, as, unlike most of the other species of Alocasias, which are surface-rooting plants, the roots of this variety descend to the bottom of the pot, and require a plentiful supply of water during the growing season. If large specimens are required, larger pots must be used; the plants must not be allowed to suffer for want of root-space. Plants propagated at this season, when well grown, should attain their full size during the following summer. *R. Milner, Penrice Castle, Swansea.*

THE ORCHID HOUSES.

THE COOL HOUSE.—An effort should be made to get the repotting of everything that requires it done as soon as possible. The night dews are now very heavy, house and plants are loaded with moisture; this tends to keep the foliage firm until the young roots get a hold upon the new potting compost. Large plants of *Odontoglossum crispum* that are sending up flower-spikes will be the better, and the spikes ripen more thoroughly, if placed as near the glass as possible. Our own are hung up over the walks, so that they may be taken down and examined daily. Before hanging up, it is advisable to dip the plant for a few minutes in tepid water, and watch carefully for any insect pests that may be within. When this precaution is taken, little trouble is likely to occur afterwards. *Masdevallia racemosa* Crossi is a brilliant little gem at this season, when seen with a large number of flowers upon it; it is also of free growth, and does well in about one part of peat to three of sphagnum. *Masdevallia tovarensis* which were brought into the cool house after flowering, should now be removed to the intermediate division. It is really unsafe to longer delay it, as this plant is very likely to drop its leaves quickly if left in the moist atmosphere in which the *Odontoglossums* do best, especially so if a little too much water should be given. *Masdevallia chimera* and its varieties will now do satisfactorily if taken into a little more warmth; this is a magnificent plant to grow, being seldom out of flower. It does well when planted in boat-shaped baskets, and hung up so that the full beauty of the flowers are easily seen; red-spider is its worst enemy, and frequent dipping and sponging of the leaves are necessary to keep it clean.

INTERMEDIATE-HOUSE.—*Pleione lagenaria* will have finished the last growth, and should be taken and treated to a baking in the sun as previously advised, but on no account should the plants be allowed to become quite dry. *Odontoglossum grande* is now opening its flowers; this is one of the very best Orchids for autumn flowering, being large and showy, and of easy culture. It requires little water at any season, but after flowering, and the present half-made pseudobulbs are properly matured, no water whatever will be required, unless it is seen that the back bulbs are showing signs of shrivelling. *Vanda Kimballiana* is a lovely object in the house, and as the plants do not all come in at the same time promises to continue so for some months. *Miltonia vexillaria* should continue to receive a good syringing morning and early in the afternoon, with a good circulation of air about them; temperature according to last Calendar. *A. G. Catt, Parkfield, Worcester.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

MONDAY, SEPT. 14—Eastbourne.

TUESDAY, SEPT. 15—Sittingbourne.

SALES.

MONDAY, SEPT. 14 { Annual Trade Sale of Stove and Greenhouse Plants, at the Dyson's Lane Nursery, Upper Edmonton, by Messrs. Protheroe & Morris
Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, SEPT. 15 { Annual Trade Sale of Stove and Greenhouse Plants, at the Burnt Ash Lane Nurseries, Lee, by Messrs. Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, SEPT. 16 { Annual Trade Sale of Stove and Greenhouse Plants, at the Lea Bridge Road Nurseries, Leyton, E., by Messrs. Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.

THURSDAY, SEPT. 17 { Annual Trade Sale of Stove and Greenhouse Plants, at the Brimsdown Nurseries, Enfield Highway, by Messrs. Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, SEPT. 18 { Annual Trade Sale of Stove and Greenhouse Plants, at the Moat Nursery, East Grinstead, by Messrs. Protheroe & Morris.
Important Sale of Orchids, at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 19 { Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—57°.6.

At Edinburgh. THE international show of the Royal Caledonian Horticultural Society is remarkable, among other features, for the immense number of the entries, and for the general excellence of the various objects shown. Taking those generally recognised as difficult to grow first, we cannot but remark the great number of entries in the Grape classes, and the marvellous manner in which finish has been put on black kinds by the northern gardener, and the generally large size of bunch and berry. There were remarkably few instances in which colour was bad.

Without the shadow of doubt, as the report of the exhibition in another column will show, the lion's share of the awards remains with our Scottish brethren, thus affording proof of their skill as cultivators, and of the suitability of their soil, and perhaps the length of the summer day, which more than compensates for the greater intensity of the solar heat in southern parts of this island.

As befits the occasion, the highest award for finish went to Mr. MACHATTIE, gardener to the Marquis of LOTHIAN. As regards numbers,

black varieties were a long way in advance of white ones, whether of Scotch or English origin; but in localising the awards it was apparent that Scotland was an easy winner. She took first honours for eight bunches, and fine ones they were; for six, and was also first in almost every small competition. The heaviest bunch of white Grapes was one of the Raisin de Calabre, shown by Mr. MORRISON, of Archerfield. The heaviest black—a Gros Colmar, weighed 12½ lb.—was produced by Mr. MATTISON, of Currie. The heaviest bunch of black Alicante Grapes was grown by Mr. GREEN, the Marquis of TWEEDDALE'S gardener.

Grapes which have been raised in recent years were few, and the highest prize was taken amongst black varieties by a cross between Duke of Buccleuch and Gros Guillaume. Growers of Grapes in Jersey, Isle of Wight, Suffolk, Cumberland (not a remarkably sunny land), and Somerset, were enabled to give their Muscats and other white kinds that desirable golden tint so indicative of thorough ripening, to a greater degree than the gardeners north of the Tweed.

Pine-apples are, as of yore, grown more commonly in Scotch gardens than further south, and the examples shown would reflect credit on the exhibitor wherever he resided. The fruits were shown on the plants, and also cut.

Bush fruits are good and abundant; unfortunately the exhibitors have failed to give names to their exhibits in many instances, and we found it impossible in all cases to recognise them. Elton Pine Strawberry is still thought something of, and we note a few capital dishes of it.

A Red Currant, called "Fail me Never," and another, Hay's Prolific, are remarkable for the fine size of their berries.

Apples from Kent, Sussex, Herefordshire, and other parts of the South, are shown in large numbers by many enterprising nurserymen, and Scottish fruit is far from being scarce or poor of quality.

It was noted that the pot-culture of the Apple, Pear, and stone fruits is of necessity adopted in certain parts of northern Britain, and well-loaded miniature trees meet the eye at various parts of the hall.

In flowers, we find a predominance of the florist's flowers—of Pansies, for which the climate is so favourable, although this season it was the exception; Hollyhocks, again reviving after the scare of some years ago; hardy herbaceous perennials, Marigolds, German, or, rather, China Asters; Gladioli, including those beautiful things of M. LEMOLNE'S raising; Dahlias, of all sections; and Carnations and Picotees.

"Down South," excepting near Bath, the culture of the Fuchsia has fallen away; but here are to be found beautifully-flowered plants from 6 to 8 feet high, and clothed with foliage and blossom down to the pot. The tuberous Begonia has found a congenial home in northern gardens, and it is running the Pelargonium hard for the first place. Some fine collections of plants and cut blooms may be observed, of these plants hardy Chrysanthemums are useful, if just a little bit unseasonable, put in appearance in some quantity, and are so good that many who have seen them will be induced to take up their culture. Vallota purpurea is a plant we are glad to note is well done by Scottish growers. Some of the pots full of it are of great size.

General decorative plants, as Palms, Crotons, Ferns, and Dracenas are much grown. The Crotons of Messrs. IRELAND and THOMSON are

particularly effective, being young, vigorous, and of beautiful tints. The time of year is unfavourable for large displays of Orchids, but still there is a fair quantity of Odontoglossums Lycastes, Dendrobium Dearii, and Cypripediums, the nurserymen's tables having the majority of these. The Lily as an autumn flower has few, if any equals in some of its species: we may mention *L. auratum*, in its several varieties, and *L. speciosum*, red and white, and these are very abundant, and also well-flowered.

Specimen flowering plants are good, if there are not many of them; and the Ericas, Ixoras, Diplacus, Lapagerias, &c., were exceptionally fine plants, as were exotic and hardy Ferns.

Vegetables are found of superlative excellence in Northern gardens, and this fact is well brought out at this show, for finer Peas, Beans, Cauliflowers, Cabbages, Savoys, Lettuces, Onions, we have rarely seen. Onions are wonderfully fine of their kind. The same may be said of the various roots, including Potatoes, which are shown in enormous quantities, and of a remarkably even degree of excellence.

The manner in which Parsley is shown in pots, as grown, we should say, for some months, is excellent, and worth adopting generally.

Large Conifers, a prominent feature at some previous shows, show a falling off in numbers and in the matter of rarity; and collections of hardy shrubs are non-existent, perhaps no great loss, when so many fine things can be noted in the open ground in nurseries.

On the opening day, the attendance of the public was fairly good, but the immense building, was at no time crowded.

The opening ceremony, in the absence of the Marquis of LOTHIAN, was performed by Viscount MELVILLE; whilst the dinner was presided over by Sir JAMES GIBSON CRAIG, with Mr. THOMSON, of Clovenfords, and Mr. CHARLES STEWART, the Secretary, as croupiers. Naturally the members of the Caledonian were warmly congratulated on their success.

THE ROYAL HORTICULTURAL SOCIETY.—The meeting of the Royal Horticultural Society on Tuesday last, was naturally not so well attended as some others, many of the Fellows being drafted off north of the Tweed, while holiday-time accounted for many defections. Nevertheless, an excellent and very interesting meeting was held. In another column we note the principal details, but here we cannot refrain from noting the truly marvellous flower of *Aristolochia grandiflora* from Kew, measuring 20 by 16 ins., exclusive of the slender tail which measured 3 ft., and the sight of which recalled the passage from Humboldt in which he mentions the Indian boys on the Magdalena river placing the flowers on their heads as caps. Very ornamental truly, and boys are not very sensitive to evil odours. The use of the long tail to the flower was the subject of comment, the general impression being that, like the similar appendage to the spathe of some of the Arisemas, it acted as a pathway for insects, who fertilise the flower, but find themselves entrapped by the beautiful-looking but fiercely-pointed hairs, admitting ingress, but forbidding egress. Another most interesting exhibit was made by Messrs. VERRILL, in the shape of *Picea Omorica*, the Servian Spruce, figured in our columns in March 8, 1884. As a decorative Spruce it is not noteworthy, but its botanical interest is great, as, although Servian and Bosnian, it is very nearly allied to the *Abies Meuziesii* of North-West America, and to *A. ajanensis* of far-off Japan, while it is also the living representative of a fossil species found in the Miocene formations. If we were to meet some of the "extinct animals" at the Crystal Palace walking about in the life, the case would be analogous to that of this Servian Spruce, to which a Botanical

Certificate was most fittingly awarded. Mr. PHIP-REN deserves credit for his arrangement of Dahlias, but we trust he will not be led into the fatal mistake of reverting to that formality from which he has broken away. Similarly, we trust Mr. KELWAY will not favour those very densely-crowded spikes of Gladiolus which find favour in some quarters. It is far better that each flower should be allowed to show itself freely, and not be encumbered and overlapped by its neighbours. Mr. LOWE's collection of Ferns was truly remarkable; many are of high decorative value, whilst others are monstrosities of great interest botanically, but appreciated rather by experts than by the populace. The same remark applies to the collection exhibited by Mr. C. T. DRURY, which was so good that he need feel no dissatisfaction at being surpassed by Mr. Lowe.

— The exhibition of British Ferns was, indeed, well calculated to support the contention that even the rarest and most beautiful exotic Ferns find worthy rivals among the innumerable abnormal forms of our indigenous species. If exceptions be cited, such as the marvellous *Adiantum Farleyense*, it is easy to restore the balance by pointing to charming types of beautiful variation which so far have found no parallels in exotic species. A striking instance of this was exhibited by Mr. C. T. DRURY, in the form of a revolute *Athyrium* (*A. revolvens*), found recently by him in Scotland, in which the frond tip and the pinnæ or side divisions are beautifully curled inwards and twisted symmetrically like ringlets. That beautiful New Zealand Filmy Fern, *Todea superba*, has long held the foremost place in redundancy of delicate moss-like cuttings; but in the examples shown of the *Polystichum* known as Jones's "densum," and a new plumose *Athyrium* (*A. f. f. plumosum Druryi*), we have two very close approaches to it in its own special line. Mr. E. J. LOWE's main collection consisted of over one hundred splendidly-grown specimen plants, the most striking of which were several forms of the frilled Hartstongue (*S. v. crispum*), of great beauty, those labelled *Willisii* and *Cowburnii* being especially valuable from the decorative point of view. Among the Shield Ferns (*Polystichum aculeatum* and *angulare*), there were several huge plants, in which the grandiceps form of heavy terminal crests seemed to have reached its extreme, giving an aspect of general sameness to some which was by no means borne out in detail. Some of these plants were of mixed parentage, both the above-named species being combined, and Mr. Lowe's hybrid attracted a good deal of attention on this account, as it represented precisely the abnormally narrow cruciate form of one species, with the hard spiny texture and make of the other. In this connection, Mr. Lowe had a special exhibit in another part of the Hall of a score or so of most remarkably crossed *Scolopendrium* seedlings, recorded by him as the conjoined progeny of four different varieties, and it could not be denied that in the majority the distinct characters of the four forms named were evident in one and the same plant. How this comes about is a biological mystery, which must be left for the future to solve. In the meantime the interesting family was awarded a Silver Medal, and hopes were expressed that it might come to town again later for judgment when the individuals were grown up. Mr. C. T. DRURY's exhibit embraced an interesting example of transitional variation in the use of *Lastrea montana* var. *cristata* gracile, bearing several fronds of quite different types of foliage and cresting to the wild ones. This seemed to consist in partial reversion to the normal by the entire obliteration of the "gracile" character, coupled with a considerable augmentation of the crests, from being flatly digitate, have become corymbiferous. One frond on a large plant appeared three years ago, and they have gradually increased in number each year, until now they are about half and half. A grand plant of *Blechnum spicans* var. *plumosum*, Airey, showed that this generally-neglected species can rival its relatives in size as well as in delicacy of cutting.

The collection of Plums from Messrs. VEITCH was also worth special notice, but these and other exhibits are dealt with in another column. In the afternoon, Mr. GEORGE PAUL addressed the meeting on "Bog and Water Plants." Those who have seen the charmingly interesting bog garden at High Beech, will know that Mr. PAUL speaks as an expert of experts on such as on many other matters.

FRUIT CONGRESS AT MANCHESTER, OCTOBER 21 AND 22.—The subjects to be treated on this occasion are:—Mr. BAILLIE, of Chester, "The Fruit-Growing Movement: Present Day Features and Prospects;" Mr. CHEAL, of Crawley, Sussex, "The Condition, Preparation, and After-Treatment of the Soil for Fruit Culture;" Mr. S. T. WRIGHT, of Hereford, "Fruit Growing for Profit;" Mr. CUMPTON, of Madresfield, "The Raising, Budding, Grafting, and Pruning of Apple Trees for Orchard and Estate Planting;" Mr. T. F. RIVERS, of Sawbridgeworth, "Orchard House Culture;" Mr. EDWARD LUCKHURST, of Romford, "The Importance of Early Planting and Shelter in Fruit Culture." In connection with this Congress, the following letter has been received from Mr. GLADSTONE:—

"HAWARDEN, August 25, 1891.

"I will not withhold the expression of my good wishes for the fortune and effect of the meeting you are to hold in October, but it will, as I hope, have the support of those who are much better entitled to speak with authority. For many years, through the activity of the press, the humble advice given by me locally to our cottagers and farmers has become an exposition to the country at large which I was hardly entitled to deliver, and for which I have naturally enough been made the subject of witty animadversion.

"I have, however, a very strong conviction that the work which you have in hand is a great and beneficial work—that there is a great commercial void which ought to be filled by British skill and labour, and that the extension of what we may term the small culture, in all its branches, will produce very considerable moral and social as well as economical benefits.

"I am, dear Sir,

"Yours very faithfully,

"W. E. GLADSTONE."

"MR. BAUCE FINDLAY."

THE AMERICAN APPLE CROP.—We learn from the *Journal of the New England Homestead*, that the American Apple crop will be better this season than last year, when it was less than in any year since 1883. According to special reports from the commercial Apple-growing regions of the United States and Canada, the variety of Baldwins will be scarce, and prices for the best brands of winter Apples will, it is believed, range from two to four dollars per barrel at New York, in the course of the winter. It is predicted that the United States' surplus for exports will be 235,000 barrels, and Canada 200,000, making a total of 435,000 barrels, or about the same as last year; against 681,000 barrels of the 1880 crop, and 1,401,382 barrels of the 1888 crop. As the English crop is short, it is thought that the prospects are excellent for American Apples in this country, which takes ninety-five per cent. of American exports. Apples are comparatively light in the central and western States, the commercial orchards of Arkansas and Missouri having more than they can do to supply interior markets. There is a heavy yield of all fall fruits—Peaches, Pears, Grapes, and Apples; but as soon as these are out of the way, the *Homestead* expects profitable prices. If Californian shipments of her fine crops of all fruits are delayed until that time, they will make almost as good prices as were reported last year, which caused unprecedented prosperity to the industry on the Pacific slope.

COPPER SALTS AS REMEDIES FOR THE POTATO BLIGHT.—The fact that solution of blue vitriol has been successfully used in combating the *Peronospora viticola*, or Vine disease, in France, has suggested its employment in checking or exterminating the Potato blight. So many experimenters have reported favourably upon the application of copper salts, that we may now regard their success as assured. Three mixtures are especially recommended for application, namely:—(1) Bouillie Bordelaise, or the original Bordeaux mixture. This is prepared as follows: Dissolve 8 lb. of pure sulphate of copper in 10 gallons of water, by heating up a

portion of the water, and after all the salt is dissolved, adding the remainder cold. In another vessel, 15 lb. of good burnt lime (not slaked) are mixed with 3 gallons of water, and carefully stirred till all the lumps disappear. The creamy mixture is now poured into the copper sulphate solution. (2) Reduced Bordeaux mixture. This is prepared in the same way, but the quantities are reduced to only 3 lb. of copper sulphate and 3 lb. of quicklime to 10 gallons of water. (3) Copper-soda solution. This should contain 2 lb. of copper sulphate and 3 lb. of soda in 10 gallons of water. The salts are first dissolved in warm water, and then the remainder of the latter added cold. It should be observed that only the very best quicklime should be employed. Inattention to this point has often given less satisfactory results with mixtures No. 1 and 2 than with No. 3. These remedies should be applied two or three times in a season, the first time as soon as the Potatoes come out of the ground, and the plants are about 2 or 3 inches high. The second application is made when the plants are near maturity, say, one month before the crop is harvested. The third application may be applied at discretion. A good water-sprinkler, syringe, or spray machine, is required for applying these remedies, and care should be taken that the leaves are well covered.

ARTIFICIAL RAIN.—In a Bill laid before the United States Senate, provision is made for granting 3000 dollars to a group of agriculturists for the purpose of conducting experiments on the artificial production of rain. The nominal head of this committee is Mr. REISK, the Secretary for Agriculture, but the soul of the movement is Senator FARWELL, who for many years has been the untiring champion of the theory that by explosion at a moderate height the moisture of the air can be condensed and converted into rain. Consequently, experiments are being conducted on the high steppes between Colorado and Kansas. The plan of the engineers is to send up dynamite by a paper balloon, the quantity sent up each time being 150 lb., of which separate parcels of 20 lb. are let down at different heights, and exploded by means of electric wires. By a series of explosions they expect to produce rain showers which will extend in all directions. The best has yet to come. In case of success, an American Artificial Rain Company will be formed, and the optimists believe that the barren prairies will be converted in fertile country. In scientific circles the experiments are supported less sanguinely, the probable results being not denied, but the doubt is expressed whether the benefits will cover the cost.

VISIT OF THE FRUITERERS' COMPANY TO THE CRAWLEY NURSERIES.—Saturday last was selected for a visit to Messrs. CHEAL & SONS' establishment. The party, to the number of eighteen, including several ladies, arrived at Three Bridges station, and were conveyed in brakes to the Nurseries. They at once commenced a tour of the grounds, in the first place inspecting the various ways of training fruit upon the cordon system. These trees, trained over arches, wire espaliers, wooden fences and walls, were all carrying heavy crops of fruit. Much interest was taken in this system of training, in which Messrs. CHEAL were pioneers, and the quantity of fruit that can be raised in a small space was seen to be enormous. One piece of wire espalier covered with Apples trained in diamond pattern attracted special attention, covered, as it was with a crop of many-coloured Apples. Some of the fruiting trees near the house were next visited, where large standard trees of Apples, Pears, and Plums were heavily laden, and, indeed, in some cases literally breaking down with fruit. From here they proceeded to the open quarters, where a number of bush Apples are planted out for fruiting. These are on the paradise stock, and comprise a collection of over seventy varieties. Out of these, there were some fifteen or twenty varieties that stood out conspicuously for their fruiting qualities, and this plantation practically demonstrated what has been so

often recommended at the recent fruit conferences, to plant only a select number of the free-cropping varieties. To enumerate a few that were here carrying magnificent crops, we noted Stirling Castle, Lane's Prince Albert, Worcester Pearmain, Potts' Seedling, Professor, Yorkshire Beauty, Cox's Orange Pippin, Lord Grosvenor, Peasgood's Non-such, Duchess of Oldenburgh, King of the Pippins, Keswick Codlin, The Queen, and Bismarck. From here they proceeded to the open nursery quarters, until they again reached the other portions of the nursery devoted to fruit trees. Here were thousands of trees of various ages, and apparently in the most vigorous health, of Apples, Pears, Plums, Cherries, &c., and here the various characteristics and differences were pointed out and noted, of Apples grafted and budded upon the Paradise and Crab stocks, and the effects of the different stocks was explained in accelerating or prolonging the fruiting period. The visitors were particularly impressed with the spectacle of young trees on the Paradise stock, only two or three years old, laden and borne down with fine samples of fruit, and this not in solitary instances, but upon every tree for row after row. The company were interested in watching the operation of budding the fruit stocks, which was in full progress at the time of the visit, as also the pruning and training of wall trees. Returning to the homestead, the room was inspected where the fruit is stored, and from which Messrs. CHEAL have exhibited such remarkably fine fruit at late periods in the season, and which was specially constructed for the purpose. The glass was next visited, and a cool orchard-house, devoted to Pears trained as cordons up the roof, was a beautiful sight, and many of the varieties were remarkably fine. Messrs. CHEAL commenced twenty years ago to form the nursery on ordinary agricultural land, and by thorough drainings, deep tillage, and good cultivation, they have been able to produce the trees and the fruit that they have now; and we might mention one fact that is of interest to the Fruiterers' Company, and in connection with the present movement for the higher cultivation of the land, that whereas the land had not employed five hands, it now sustained more than ten times that number, which was of importance from a national point of view.

ROSE EXHIBITORS. Some stir is being made in Rose-growing circles about the disadvantages under which small growers labour in comparison with large ones, and various schemes have been devised to meet the case. No doubt, the National Rose Society will be able to arrange a compromise, but in the meantime, as a matter of principle, exhibiting and competing benefit the individual more than the cause, and while not ignoring the foibles and fancies of human nature, and of exhibitors in particular, ought not our sympathies, or at any rate those of the corporate Society, to be with the latter, rather than with the former?

FUNGUS FORAY.—The September excursion of the Yorkshire Naturalists' Union is arranged for Wednesday and Thursday next, September 16 and 17, at Doncaster, and will be chiefly devoted to a Fungus foray—under the superintendence of Mr. G. MASSEE, of Kew. The districts selected for investigation are the good old Edlington and Wadworth Woods, &c., which have never been explored for fungi. There will be a fungus show at Glyn Hotel, Doncaster, and mycologists from any part of Britain will be heartily welcomed. Mr. M. H. STILES, Frenchgate, Doncaster, will be glad to supply particulars.

NEWCASTLE HORTICULTURAL SOCIETY.—In response to the appeal of the Mayor of Newcastle for subscriptions to meet the liabilities incurred by the disastrous gale announced in our last issue, the public have subscribed most handsomely, £525 being forthcoming up to Saturday, September 5. This speaks well for the love of horticulture in the district. We trust the future efforts of the Society may be crowned with success.

HOME CORRESPONDENCE.

RHUS TOXICODENDRON.—We should feel greatly obliged by your giving us, in the next issue of the *Gardeners' Chronicle*, the correct name of the enclosed, of which we have a large plant now climbing on a south wall. *Ampelopsis japonica* was the name given to us with the plant, but we think it is a species of *Rhus*. About two months ago, one of our men was propagating some, and a few days afterwards he was taken ill with what appeared to be a very serious attack of erysipelas; he recovered from the attack, and commenced work, and again made a lot of cuttings from the same plant. Shortly afterwards, he was again seized with a similar attack, and is now lying in a serious condition; head, arms, and legs very much swollen, and showing all the symptoms of blood-poisoning, for which the doctor is now treating him. There are several plants in this neighbourhood. The leaves in the autumn turn a beautiful orange-scarlet, similar to *Ampelopsis Veitchii*. P. & Co. [The plant is *Rhus toxicodendron*, var. *radicans*, a very poisonous plant. It was originally sent out as *Ampelopsis japonica*, but the mistake was happily soon found out. Ep.]

SOCIETIES.

ROYAL HORTICULTURAL.

Fruit Committee.

TUESDAY, Sept. 8.—Present: Philip Crowley, Esq., in the chair; also Messrs. W. Warren, J. Wright, J. W. Bates, A. Dean, G. Norman, J. Willard, R. Hogg, R. D. Blackburn, H. Weir, T. F. Rivers, A. H. Pearson, H. Balderson.

A Silver Banksian Medal was awarded to Messrs. James Veitch & Son, Chelsea, for the collection of forty dishes of Plums, comprising all the best kinds, such as Kirke's, Jefferson, Czar, Denniston's Superb, Early Transparent Gage, Brandy Gage, the three latter of good flavour.

Award of Merit for Halstead Favourite Melon to T. F. B. Atkins, Esq., Halstead Place, Sevenoaks, gr., Mr. A. Gibson; it is a green-flesh variety with yellow reticulated skin and fine aroma.

Cultural Commendation to Philip Crowley, Esq., Waddon House (gr., Mr. W. King), for nineteen fruits of Louis Bonne Pears grown on single tree in a 10-inch pot, the fruits were of medium size, and rich yellow colour with crimson spots. He also showed two lots of Jefferson Plum from same tree, one double the size of the other, and better coloured, the difference being due to constriction of bark, causing the fruits above it to swell as in the process of ringing.

Cultural Commendation to W. Roupell, Esq., Harvey Lodge, Roupell Park, S.W., for large well-coloured fruits of Lord Sullfield, Bictingheimer, and Duchesse d'Oldenburgh Apples, grown in the open, within 5 miles of Charing Cross.

Vote of thanks to Messrs. Jacob Wrench & Sons, 139, King William Street, City, for a basket of Parsley, with thick beautifully curled foliage.

Vote of thanks to Mr. Whiteley, Hillingdon Nursery (Manager, Mr. Thomas Godfrey), for dish of Hillingdon Favourite Tomato, smooth clear skin, bright scarlet, large.

Orchid Committee.

Present: Dr. M. T. Masters in the chair; James O'Brien, Sec.; and Messrs. E. Hill, H. Ballantine, A. H. Smee, T. B. Haywood, and C. Pilcher.

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), again exhibited, in fine condition, the *Laelia elegans* Bleheimensis, which received an Award of Merit at the last meeting; also *L. elegans* Turneri atrorubens, a form with a very dark front lobe to the labellum; *L. c. T. Stand Hall* var., with sepals and petals paler than in the ordinary form; *Odotoglossum Harryanum*, and *Saccolabium Blamei*, named *longeracemosum*, which bore no distinctive feature.

Baron Schroder, The Dell, Egham (gr., Mr. H. Ballantine), sent the only really remarkable plant of the meeting, viz., *Miltonia Biantii* Lubbersiana, a grand example of the genus. It had two stout spikes of many large flowers; the sepals and petals nearly equal in width, whitish-lilac, profusely blotched with irregular rosy-lilac bars. The large

flat labellum is light-purple at the base, fading off to nearly white in front, and with two blotched lines of purple on each side of the crest. A First-class Certificate was unanimously awarded to this fine exhibit.

Messrs. Hugh Low & Co., The Nurseries, Clapton, staged a good example of *Vanda Kimballiana*, with many spikes; *Cattleya Gaskelliana* albens, *Catasetum fimbriatum*, and a new rich yellow form of *Mormodes buccinator aurea*.

Messrs. F. Sander & Co., St. Albans, exhibited *Laelia elegans* Robinsoniana, a dwarf and richly-coloured form of the Turneri section; also *L. e. Marlboroughensis*, equally good; and a fine *L. e. Turneri*; also *Dendrobium undulatum*, *Vanda cœrulea*, the pretty pink and orange *Cattleya crocata rosea*, and an extraordinary small form of *Cattleya granulosa* named *C. g. Dianceana*. The flowers of this form are much smaller than those of the type; sepals and petals green and unspotted, the side lobes of the lip are white, and the middle lobe reduced to a narrow, warded, rose-coloured blade; the column is yellow, tipped with purple.

Messrs. Charlesworth, Shuttleworth, & Co., of Heaton, Bradford, sent five plants of their importation of *Oncidium macranthum*, the flower-spikes of some of which were erect and only a few inches in height, and which it is hoped will remain constant, or at least with much shorter spikes than usual. *Drewett* (O. *Drewett*, Esq., Riding-Mill-on-Tyne (gr., Mr. A. J. Keeling), sent a flower of his *Cypripedium Beatrice* × (*Lowi* × *Boxalli*), and of *C. Eyermanianum* × *Drewett's* var. (*Barbatum nigrum* × *Spicerianum*).

C. J. Lucas, Esq., Warnham Court, Horsham, exhibited a finely-flowered plant of the white *Angraecum articulatum*, for which a Cultural Commendation was awarded; and W. Wright, Esq., The Grange, Denmark Hill (gr., Mr. G. Parrot), sent a plant in flower of *Catasetum fimbriatum* (male) and another of the same species, with two female flowers, with elongated helmet-shaped labellum, and two and two buds (male) of the type usually seen—a most interesting exhibit.

Floral Committee.

Present: William Marshall, Esq., in the chair; Messrs. G. Paul, J. Fraser, C. T. Drury, H. B. May, R. Dean, J. T. Poe, G. Phippen, C. Noble, W. Watson, and Dr. Masters.

From the Royal Gardens, Kew, some interesting plants were exhibited:—*Aristolochia grandiflora* (syn. *A. gigas*), Guatemala; the flat portion of perianth measured 16 inches by 20, with a pendulous filament 3 feet long; it is reticulated, white, and rich brown, the centre rich velvety-purple, interior of tubelined with reflexed hairs; odour very powerful. Leaves 6 to 8 inches long, ovate cordate. *Clematis Stanleyi*, from Transvaal: the whole plant is covered with silvery pubescence; leaves pinnate, leaflets pinnatifid. Flowers lilac-pink, 1½ inch across, stamens yellow. *Ixora macrothyrsa* (syn. *I. Duffii*), Sumatra; flower-head about 8 inches in diameter, semi-globose, vermilion-scarlet; foliage massive. *Mucuna atropurpurea*, India and Malacca; a climber with ternate foliage, leaflets obliquely ovate; flowers papilionaceous, 2 inches long, in pendulous racemes of about thirty flowers, hood-shaped, standard and horizontal, black-purple, carina red-purple. *Solandra grandiflora*, Tropical America; flowers 10 inches long, calyx-tube triangular, three-lobed; corolla trumpet-shaped, lobes recurved, edge fimbriated, colour from pale yellow to buff, with chocolate bars in the interior.

A Bronze Banksian Medal was awarded to J. Veitch & Sons, for *Hydrangea paniculata*, with large pyramidal heads, about 8 inches deep, of cream-coloured flowers and pink buds, and other hardy plants; also botanical Certificates for *Picea Omorika* (South-east Europe). The plant was 4 feet high, this season's leader being 18 inches long; leaves deep green above, glaucous below. They also exhibited nice blooms of *Lilium auratum virginale*, *L. a. platyphyllum*, and *L. a. rubro vittatum*, as well as baskets of well-grown *Francoa ramosa* (Chili), full of flower.

Messrs. Paul & Son, Broxbourne, Herts, had a collection of bog plants, including good *Sarracenia purpurea*, *Spiraea japonica compacta*, *Carex folliculata*, *Liatris pycnostachya*, &c.

The First prize for a collection of British Ferns and their varieties was awarded to E. J. Lowe, Esq., F.R.S., Shirenewton Hall, Chesham, for an interesting and beautiful collection, thus securing the Silver Cup.

First-class Certificates were awarded for the following Ferns:—*Scolopendrium vulgare* var. *Moonæ*; fronds lanceolate, crimped edge, with ridge running

parallel to each edge. *Osmunda regalis capitata* (raised from bulbil); compact, the edges of pinnae crested. *Asplenium f.-l. lunulatum* var. *Nelliae*; the middle pinnae are almost suppressed, and the fronds terminated by a fine tassel. *Aspidium aculeatum* var. *hybridum* (*A. angulare* × *A. aculeatum*), pinnae pinnatifid, macronate, dark shining green; *Nephrodium paleaceum*, var. *Willisi*, nicely crested variety; *Scolopendrium v. ramo-inequale*, var. *laudabile*, large branched fronds, sori at the edge; *Aspidium angulare*, sec. *cruciatum*, var. *Nympha* (raised), the pinnae pointed and sloping towards the apex of the frond; and *A. a. sec. graciceps*, var. *tueda*, a curious variety with a tassel at the end of fronds, and each pinnae crested.

Botanical Certificates were awarded to *Scolopendrium vulgare*, sec. *periferens*, var. *Nepenthesoides*, a curious variety with saucer-shaped cavity at the end of the frond; also to *Aspidium aculeatum cristatum circumglobatum*, a nice dense variety; and several Awards of Merit to good varieties. He also showed some seedlings, showing the effects of crossing varieties of *Scolopendrium vulgare*; a Bronze Banksian Medal was awarded for this group.

The 2nd prize for Ferns was awarded to C. T. Drury, Esq., F.L.S., Fernholme, Forest Gate, Essex. In this fine group was *Athyrium f.-f.*, var. *plumosum* *Druryi*, new, a seedling from *superbum*, multipinnate fronds, graceful and delicate green; awarded First-class Certificate. Awards of Merit were granted for *A. f.-f.*, var. *revolvens*, in which the pinnae were curled under, like a feather; and to *A. f.-f.* var. *superbum*, dense, finely divided delicate fronds. A handsome specimen of *Polystichum angulare*, var. *divisilobum plumosum densum*, probably the most elegant of hardy Ferns, fronds tripinnatifid, pinnae overlapping.

A fine strain of quilled German Asters, grown at Chiswick from seed supplied by Mr. John Walker, nurseryman, Thame, was commended. A dwarf early-flowering *Chrysanthemum*, of the type of *Madame Desgranges*, but with quilled white florets, named *Mrs. Whiteley*, came from Mr. William Whiteley's nursery, at Hillingdon, and the committee desired to see it again. Mr. Arthur Rawlings, nurseryman, Romford, had show Dahlias: *George Gordon*, a large bright crimson self, fine in petal and outline, but inclined to be a little flat; and *George Hurst*, maroon, deeply tipped with purple, this portion of the petal having stripes of maroon running into it, one of those flowers which partake both of the show and fancy character; and *William Britton*, a dark-striped fancy. From Mr. J. T. West, The Gardens, Cornwall, Brentwood, came show Dahlia *Arthur Rawlings*, a large, bold, and finely-formed crimson self, shaded in the centre, fine in petal and outline, and perfect in the centre (Award of Merit). *William Powell*, a very fine, well-formed, deep yellow self, of fine quality (Award of Merit); and decorative Dahlia *MacKeith*, salmon and delicate mauve, of a pale yellow ground, with slight lines of yellow on the margin—a very pleasing and attractive variety (Award of Merit).

From Messrs. Paul & Son, Old Nurseries, Cheshunt, came Decorative Dahlia *Harlequin*, yellow, flaked and striped with crimson—very constant, and quite novel and distinctive in character (Award of Merit); and blooms of *Roses H. P. Cheshunt*, scarlet; *H. P. Bruce Findlay*, *H. P. Dowager* *Duchess of Marlborough*, and *Bourbon Mrs. Paul*, to show their autumnal character.

Mr. H. B. May, Dyson's Lane Nursery, Edmonton, sent *Croton Golden Ring*, a form of the *C. spiralis* type, with long pendent leaves, much twisted, the upper surface deep gold blotched with green, the under surface blotched and marked with wine-crimson; the quite small plants were richly coloured, and it promises to make a highly valuable decorative and table plant (Award of Merit).

A superb collection of Gladioli from Messrs. Kelsey & Son, of the Langport Nurseries, occupied nearly the whole of one side of the Hall. Altogether there were about 150 spikes, many of them exceedingly fine. Prominent were two varieties, submitted as representing a new break, inasmuch as the usual flame of colour—purple, or some such shade—no longer appeared upon the throat; they were *Lady Brooke*, blush, with sulphur throat, and slight flakes of purplish-crimson, very soft and delicate in tint, and fine form (Award of Merit); and *George Meredith*, blush-sulphur throat, and heavily flaked with rosy-crimson (Award of Merit); and among the varieties of ordinary character were *W. S. Gilbert*, delicate pink, flaked with carmine, very distinct and novel (Award of Merit); *Sir A. Sullivan*, very bright pale orange-scarlet, with slight flakes of

cerise, extra fine (Award of Merit); *Sheila*, white, with bright violet-purple flames on the throat, a charming light variety (Award of Merit); *Pandanus*, pale salmon, flaked with pink and carmine, and slight purple lines; *Rev. J. Stubbs*, deep orange-scarlet, with rich purple marking; *Sir F. Leighton*, rich bright scarlet, flaked with deep crimson; *Arthur Turner*, blush, flushed with pink, and pencilled with deep pink; *Harrison Weir*, fine bright pale carmine, and slight flakes of crimson; *Mrs. Stewart*, pale ground, heavily flaked with crimson purple; and such fine older varieties as *The Odalisque*, *Baroness Burdett-Coutts*, pale purple, extra fine; *Dercyllus*, *Electra*, *Rev. H. H. D'Ombrain*, *Ada*, *Sir G. Nares*, *Henry Irving*, pale yellow, *Princess Beatrice*, *Joseph Broome*, *John Dominy*, &c. From M. Victor Lemoine, Nancy, came *Phlox Flambeaux*, large in size, and fine in form, of a bright pale orange carmine colour, but with a fatal tendency to run to a pale colour. From M. C. G. Van Tubergen, jun., Zwansenburg, Haarlem, came a number of spikes of hybrid Gladioli, obtained from a cross between some of the best forms of *H. Gandavensis* and *G. Saundersii*, wanting in the quality of our English-grown varieties, but suggestive of being useful as seed parents, in that the colours and marking were somewhat novel. *Mr. J. Hole*, Commercial Street, Teignmouth, sent blooms of a deeply-fringed Carnation, named *Devon Beauty*, carmine pink, edged with white.

Mr. George Phippen, nurseryman, Reading, staged two very fine and effective groups, one of shields of Cactus and decorative Dahlias, from fifteen to twenty blooms being used on each, set up with a background of *Dracaena australis*, and intermingled with which were *Cocos Weddelliana* and other elegant Palms, and Maidenhair Ferns. Altogether, there were about fifty of these shields, and they had a fine and imposing effect. He also had a fine group of Lilies, varieties of *L. speciosum*, *L. auratum*, and *L. Harrisii*, intermingled with Ferns, Palms, &c., which was highly effective. A Silver Flora Medal was awarded to each; he also arranged a box of Maidenhair Fern.

NATIONAL DAHLIA.

SEPTEMBER 4 AND 5.—The state of the season affected the Dahlias brought together on the occasion of the annual exhibition of the National Dahlia Society at the Crystal Palace on the 4th inst. The season had seriously affected the quality of the flowers; the blooms were small, and many rough; some too old, others too young; and these facts indicate the difficulty exhibitors had in making up their collections. A week's previous fine weather would have worked wonders, and though so ardently longed for, it did not happen. Many exhibitors who had entered in the hope of being able to compete, found themselves unable to do so at the last moment—but that is a circumstance common to all large exhibitions of cut flowers. There was a certain amount of roughness about the decorative and Cactus variety, but it was not so perceptible as in the case of the show varieties, where symmetry is all important; but the Pompon varieties lacked their usual admirable finish, and the single varieties some of their usual charming freshness. But the best of cultivators cannot do in a bad season what can be accomplished in a good one. As is usual, the Dahlia show was held in the western portion of the nave, and the light was excellent. A great many novelties were staged, and a larger number of certificates than is usual were granted.

NURSERYMEN'S DIVISION.

Show Dahlias.—Despite the unkind season, there were as many as five collections of sixty blooms, distinct. Into this class Mr. C. Turner, Royal Nursery, Slough, put all his strength, staging the finest and most finished blooms in the show, and won in a canter; he had *William Rawlings*, *Earl of Ravensworth*, *Comedian* (fancy), *Prince Bismarck*, *Matthew Campbell* (fancy), *Mrs. Harris*, *Alice Emily*, *Mrs. Foster*, *John Henshaw* (new, fine crimson self), *Herbert Turner*, *Rev. J. B. M. Camm* (fancy), *George Rawlings*, *Mrs. Langtry*, *Colonist*, *Harry Keith*, *Henry Walton*, *Rebecca*, *Mrs. W. Slack*, *Glowworm*, *Lorina* (orange buff self, very fine), *James Cocker*, *Ethel Britton*, *John Hickling*, *Mrs. Saunders* (fancy), *Burgundy*, *Seraph*, *Florence*, *Mrs. G. Harris*, *Agnes*, *Sunbeam*, *John Bennett*, *Marion Fellowes*, *T. W. Girdlestone* (fancy), *John Standish*, *Clara*, *Old Tom* (a fine crimson self), *Miss Fox*, *Crimson King*, *Mrs. Gladstone*, *Goldfinder*, *R. T. Rawlings*, *Bendigo*, *Primrose Dame*, *Lustrous*, *Charles Wyatt* (self),

Flag of Truce, *Nellie Tranter*, &c.; undoubtedly the presence of a few fancy varieties did add a very pleasing effect to this stand. Messrs. Keynes, Williams & Co., Nurserymen, Salisbury, were placed 2nd, with smaller, still neat, blooms of *T. W. Girdlestone* (fancy), *Miss Cannell*, *Crimson Globe*, *Spitfire*, *Rebecca* (fancy), *Royal Queen*, *Mr. Glasscock*, *William Rawlings*, *John Hickling*, *Dorothy*, *Queen of the Belgians*, *T. S. Ware*, *Harry Turner*, *Lady G. Herbert*, *Duchess of Albany* (fancy), *Imperial*, *Shirley Hibberd*, *Frank Pearce* (fancy). 3rd, *Mr. A. Rawlings*, *Nurseryman*, *Romford*.

In the class for forty-eight blooms, there were four exhibitors, and Messrs. Keynes & Co., were placed 1st, with some very good flowers, prominent being *Thomas Hobbs*, *Spitfire*, *Duchess of Albany* (fancy), *Rev. J. B. M. Camm* (fancy), *William Rawlings*, *James O'Brien* (fancy), *Mr. Glasscock*, *R. T. Rawlings*, *King of Crimsons*, *Shirley Hibberd*, *Mrs. Saunders* (fancy), *Frank Pearce* (fancy), *Mrs. Langtry*, *J. T. Vaughan*, *John Henshaw*, *Mrs. Gladstone*, *Comedian* (fancy), *Prince of Denmark*, *Edmund Boston*, *Colonist*, *Mrs. P. McKenzie*, *Nellie Cramond*, *Coronet*, *Miss Cannell*, and *Queen of the Belgians*. 2nd, *Mr. A. Rawlings*, with *General Gordon* (fancy), *Maud Fellowes*, *Harry Keith*, *James McIntosh* (fancy), *Queen of the Belgians*, *Prince of Denmark*, *Egyptian Prince* (self crimson), *George Rawlings*.

There were five exhibitors of thirty-six blooms, and here a rising West of England grower, Mr. George Humphries, nurseryman, Chippenham, was placed 1st, with *Duchess of Albany* and *Frank Pearce*, fancies; *William Rawlings*, *Ethel Britton*, *Harry Turner*, *J. W. Lord*, *Salamander* (fancy), *Hope*, *Hercules* (fancy), *Mrs. Kendal*, *Mrs. Saunders* (fancy), *Colonist*, *Sunset* (fancy), *James Stephen*, *Maud Fellowes*, *Shirley Hibberd*, *Nellie Cranmore*. 2nd, Messrs. J. Saltmarsh & Son, nurserymen, Chelmsford, with *Mrs. F. Foreman*, *Mrs. W. Slack*, *T. S. Ware*, *J. B. Service*, *Mrs. Gladstone*, *H. W. Ward*, *Constance*, *Mrs. Glasscock*, *R. T. Rawlings*, *Frank Pearce* (fancy), *Harrison Weir*, and *Willie Garratt*.

Mr. Humphries was also 1st with twenty-four blooms, out of five exhibitors, staging good ones of *Duchess of Albany* (fancy), *Mrs. J. Downie* (orange self), *R. T. Rawlings*, *Wm. Rawlings*, *Mrs. Saunders* (fancy), *Harry Turner*, *Maud Fellowes*, *Frank Pearce* (fancy), &c.; 2nd, *Mr. J. Walker*.

There were six exhibitors of twelve blooms; Mr. J. R. Tranter, nurseryman, Henley-on-Thames, was 1st, with good flowers of *William Keith*, *George Rawlings*, *Mrs. Gladstone*, *Joseph Ashby*, *Willie Garratt*, *J. T. West*, *Harrison Weir*, *John Standish*, *Chorister* (fancy), and *Seedling*; the blooms were small, but very correct. 2nd, *Mr. H. Harris*, *Writtle Road*, *Cambridge*, with blooms only just inferior.

Cactus and Decorative Dahlias.—The bunches of these were a striking feature indeed, and there were five exhibitors of twelve varieties. Messrs. Keynes & Co. were placed first with *St. Catharine*, pale yellow, new; *Juarez*, *Mrs. Hawkins*, *Baron Schroder* (new, and very fine), and *Mrs. Arthur Newall* were red shaded; *Countess of Pembroke*, pale pinkish mauve; *Duke of Clarence* and *Kyneth*, brilliant orange scarlet, type of *Juarez*; *Viscountess Folkestone*, *Lancelot*, *Dr. Masters*, and a *Seedling*. Messrs. J. Cheal & Sons came in a good 2nd, with *Duke of Clarence*, *Marchioness of Bute*, *Mrs. G. Reid*, *Robert Maher*, *Professor Baldwin*, *Beauty of Arundel*, *Mrs. Tait*, *Empress of India*, *Harry Freeman*, *Black Prince*, *Millie Scupham*, and *Juarez*. There were four exhibitors of nine bunches, and Messrs. J. Burrell & Co., *Howe House Nurseries*, *Cambridge*, were placed 1st, with fine bunches of *Juarez*, *Mrs. Hawkins*, *Mrs. G. Reid*, *Black Prince*, *H. Freeman*, *Amphion*, *Professor Baldwin*, *Mrs. Douglas*, a very pretty pinkish salmon variety, and *Robert Maher*. 2nd, *Mr. N. V. Scale*, whose best bunches were *Honoria*, *Cannell's Favourite*, *Henry Cannell*, and *Panthea*. In the class for nine bunches of Cactus varieties, six blooms of each, Messrs. J. Cheal & Sons took the 1st prize.

Pompon Dahlias.—These certainly appeared to have missed something of their usual symmetry and finish, and they appeared to have gone to size. The best stand of twenty-four varieties, in bunches of ten blooms of each, came from Messrs. Keynes & Co., who had *Darkness*, *Lady Blanche*, *Hector*, *Golden Gem*; 2nd, Messrs. Cheal & Sons, who had *The Khedive*, *Achilles*, *Phoebe*, *Iolanthe*, *Othello*, *Don Juan*, *Dora*, *Little Bobbie*, *Darkness*, *H. E. Searle*; 3rd, *Mr. C. Turner*.

With twelve varieties, Messrs. Paul & Son were 1st. *Single Dahlias*.—There were four exhibitors of

twenty-four single Dahlias, ten blooms of each, and Messrs. Cheal & Sons maintained their old supremacy, both for quality and for effective setting-up; 2nd, Mr. C. Steed, Addiscombe, Croydon. The class for twelve bunches did not bring any exhibitors.

Owing to the pressure on our space we are compelled to omit the remainder of the report, and that of the Crystal Palace Show, which will be given in our next issue.

NATIONAL CHRYSANTHEMUM.

SUMMER chrysanthemums were the chief feature of the exhibition opened yesterday at the Royal Aquarium, though Dahlias and Gladioli made an excellent display. Among the chief exhibitors of the former were Mr. J. A. Houlton and Mr. Vince, and Mr. Owen sent a splendid group of early Pompon and incurved summer varieties in several new and beautiful colours. Mr. Theobald, M.P., Messrs. Phippen, Messrs. Cheal, Messrs. Ware, and Messrs. Keynes were among the prize winners for Dahlias, and showed remarkably fine collections.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

THE following is a report of this remarkable exhibition—remarkable for extent, there being about 4000 entries, but lacking in the finer features of the great Belgian shows, in the way of Cycads, Palms, and Tree Ferns to conceal the gaunt-looking rafters of the Waverley Market Hall in which the exhibition is held.

Special Prizes.

The Silver Cup, of the value of £10, presented by the Turner Memorial Trustees, for the best collection of fruit in the show (twelve dishes) was awarded to Mr. McIndoe, Hutton Hall, Guisborough.

The Veitch Memorial Medal and £5, for the most meritorious dish of fruit in the show, was won by Mr. McHattie, Newbattle Abbey, for fine bunches of Muscat of Alexandria Grapes.

A second Veitch Memorial Medal and £5, for the most meritorious Orchid, or stove or greenhouse plant, in the show, was won by Mr. Finch, for a magnificent specimen of *Ixora Duffii*, covered with trusses of its magnificent flowers, some of which measured 16 inches across.

The third Medal, for the most meritorious hybrid was not awarded—not for want of worthy subjects, but from the interpretation the judges placed on the terms of the programme, else it should have gone to Mr. Lindsay for a hybrid *Nepenthes*.

CLASS I.—COLLECTIONS OF FRUITS.

In these exhibits were to be found some most superior examples of cultivation, both of Grapes and other fruits; Pears and Apples from orchard-house trees having greatly aided most of the successful exhibitors. In the large class for twelve dishes of fruit without any restriction as to kinds shown, Mr. McIndoe, gr. to Sir Joseph Pease, Bart., M.P., Hutton Hall, Guisborough, was first with a superb display of fruit throughout, all being in the best possible condition. Of Grapes, he had three bunches of Golden Champion, finely finished in every respect, large in bunch and berry, these latter being also of a beautifully clear colour, and three bunches of Gros Maroc, also of large size and perfect in finish. Two excellent Pines, one Queen and one Smooth Cayenne, both well ripened; two excellent Melons, one being Hero of Lockinge, and one Exquisite, a medium bunch of Bananas, a splendid dish of Souvenir du Congrès Pears, highly coloured fruits of Golden Eagle Peach, well-ripened Ribston Pippin Apples, Stanwick Elrue Nectarines, Brown Turkey Figs, and Kirke's Plums, completed this fine exhibit. The 2nd prize in this class was awarded to Mr. Murray, gr. to the Marquis of Ailsa, Culzean Castle, Maybole. This collection comprised splendid Muscat of Alexandria Grapes, large bunches and good colour; huge clusters of Alnwick Seedling, well ripened, an extra fine bunch of Bananas, two good Pines, good Melons, Peaches, and Figs. The 3rd prize in this class went to Mr. Hunter, gr. to Earl of Durham, Lambton Castle, fine Gros Colmar and Calabrian Raisin Grapes, a splendid dish of Souvenir du Congrès Pears, and two excellent Pine-apples were shown here.

For a collection of twelve dishes, from which Pine-apples were excluded, Mr. Hunter won the 1st prize, showing very strongly. Of Grapes he staged extra fine Gros Colmar, the best bunches of this kind shown, very fine, both in bunch, berry, and colour; three large clusters of Barbarossa, well coloured;

and three of similar description of Black Alicante. Other fruits consisted of Scarlet Premier Melon, Gregorie Bourdillon Pear, Royal George Peach, and Worcester Pearmain Apples, all of which were of first-rate order of merit; Mr. McKelvie, gr. to Dowager-Duchess of Roxburgh, Dunbar, was an excellent 2nd, having good Muscat of Alexandria, Barbarossa, and Black Alicante Grapes, good Peaches, Nectarines, and Pears. Mr. Fairgrieve, gr. to Dowager-Duchess of Athol, Dunkeld, was 3rd, having some good Grapes, an extra large Melon, with other capital dishes of Peaches, Apples, and Pears.

With twelve dishes of fruit grown in an orchard-house, exclusive of Grapes and Pines, Mr. McIndoe was a fair 1st; in this instance he had Doyenné du Comice Pears—fine; the same of Souvenir du Congrès, Emperor Alexander Apple, of large size, with a grand dish of Bismarck, Exquisite, and Princess of Wales Peaches, Spencer and Humboldt Nectarines, Kirke's and Magnum Bonum Plums, with Brown Turkey Figs, and *Passiflora edulis*, making a good collection. Mr. Hunter in this instance was 2nd, his best dishes being Burré D'el and Clapp's Favourite Pears, both fine; Peasgood's Nonsuch, and Warner's King, of extra size; capital Plums and Peaches. Mr. Melville, gr. to Hon. G. G. Dalrymple, St. Boswell's, was 3rd; here was an excellent dish of Bigarreau Noir de Schmidt Cherries, and another variety of Bigarreau, with two excellent dishes of Rivers' Orange Nectarines.

For twelve dishes of fruit, excluding Pines and Grapes. Mr. Hunter once more won the 1st prize here; he showed the following in first-rate condition:—Souvenir du Congrès and Gregorie Bourdillon Pears, Lord Napier and Victoria Nectarines, Worcester Pearmain and Ribston Pippin Apples and two good Melons, all first class fruit. Mr. McIndoe in this case was 2nd with Pitmaston Duchess and Doyenné de Comice Pears, both extra fine, with excellent fruits of Blenheim Orange and Scarlet Model Melons; good Nectarines and Plums made up this collection. Mr. Melville came 3rd in this class with good fruit, amongst which were some capital Bigarreau Napoleon Cherries, and large fruits of Newton and River's Orange Nectarines.

For eighteen dishes of fruit grown in the open air in Scotland, Mr. Fairgrieve was first with a remarkably fine exhibit, William's Bon Chrétien and Pitmaston Duchess Pears, Peasgood's Nonsuch and Worcester Pearmain Apples, Governor Wood and Morello Cherries, both extra; Large Early Apricots (very fine), very good Peaches, Nectarines, Plums, Figs, and Red Currants being his best dishes. Mr. Day took the 2nd prize, also showing some well-grown fruit, Morello and Late Duke Cherries, Magnum Bonum and Pond's Seedling Plums, Castle Kennedy Figs, William's Bon Chrétien Pears, and Lady Sudeley Apple being his best dishes. Mr. Goodfellow, Perth, was 3rd, showing a good all-round collection of fruit.

With twelve dishes of fruit grown in the open air in England, Mr. Craap, gr. to Lord Wimborne, Canford Manor, was awarded the 1st prize, staging some very well-grown and highly-coloured fruit; these consisted of Duchesse d'Angoulême, William's Bon Chrétien, and Doyenné Bouscch Pears, all extra good, Red Astrachan, Worcester Pearmain, and Ribston Pippin Apples, Lord Napier and Pitmaston Orange Nectarines, both fine dishes, good examples of Figs in Brown Turkey; excellent Morello Cherries and large Plums, with other good fruit. The 2nd prize, collection from Mr. Nicholson, gr. to Wm. Melles, Esq., Sewardstone Lodge, Essex, included fine examples of Pears in River's Princess and Clapp's Favourite, Warner's King and Peasgood's Nonsuch Apples, with good fruits of Nectarines, Plums and Cherries, the 3rd prize being taken by Mr. Wright, Hereford, in which some few dishes were good, whilst others were weak.

The Turner Memorial Prize for the best collection of fruit in the exhibition was awarded, after careful consideration, to Mr. McIndoe for his fine exhibit in Class I., section 1, viz., for twelve dishes of fruits with no restrictions.

CLASS II.—GRAPES.

In this section the greatest amount of interest was centered in the classes for collections. In these some of the finest produce in the show was to be seen, to which no exception could be taken. Many of the exhibits were of remarkable character and quality. For eight bunches, four varieties, there were eight competitors. The 1st prize was rightly awarded to Mr. Kirk, gr. to J. T. Paton, Esq., Norwood, Alloa. The varieties were Madresfield Court, bunches of extra size, berries large, with no semblance

of cracking; Black Hamburg, bunches again of extra size, in every way first rate; Gros Maroc bunches extra fine, berries not so large as in some instances; and Alnwick Seedling, with large clusters and fine berries. In each instance the finish was perfect, the colour and bloom of the finest. The only fault one could find was the absence of Muscat of Alexandria, which if present instead of the last-named kind, to give more quality, would have made this collection almost invincible. Mr. Taylor, gr. to J. Chaffin, Esq., Bath, came a close 2nd; his varieties were—Muscat of Alexandria, in fine condition, both as regards colour, berries, and bunches—there was, however, a slight trace here and there of rust, which was the only defect; Madresfield Court was also well shown, hardly so fine in berry as those in the 1st prize collection; Black Alicante, the bunches of extra size and superior finish; and Alnwick Seedling, again slightly behind his opponent's pair. Mr. Murray, gr. to T. L. Learmouth, Esq., Polmont, was 3rd, with good bunches, well coloured, the berries rather smaller than in the 1st and 2nd prizes.

The other exhibits in this class were of excellent quality. Mr. Kirk was 1st again for six bunches, not less than three varieties, showing Madresfield Court, Black Hamburg, and Gros Maroc, the latter being extraordinarily fine in berry and colour. Mr. McHattie, gr. to the Marquis of Lothian, Newbattle Abbey, was a capital 2nd in this class, showing three superb bunches of Muscat of Alexandria, grandly coloured, with one of Black Hamburg, and two of Madresfield, all well finished, the bunches of medium size in each instance. Mr. Mackinnon, gr. to Viscount Melville, Lasswade, came in 3rd, with some splendid fruit, showing Madresfield Court, a fine bunch, but hardly coloured, Muscat of Alexandria, of medium size; two huge clusters of Gros Maroc, and a splendid bunch of Golden Hamburg, with another of Black Hamburg, also good. In this class eleven competed.

For four bunches in varieties, Mr. Taylor beat his opponent in the larger class, having highly finished examples of Alnwick Seedling, Madresfield Court, Muscat of Alexandria, and Black Alicante, all fine in bunch and berry. Mr. Kirk came in this case 2nd, with one each of Black Hamburg, Madresfield Court, Gros Maroc, and Alicante, all in good condition; Mr. Murray again following 3rd with well-coloured bunches. In this class there were again eleven competitors.

For two of bunches Black Hamburg, Mr. Witherpoon, Red Rose Cottage, Chester-le-Street, was 1st, the clusters being finely coloured, but the berries rather small; Mr. Boyd, Falkirk, being 2nd, with good examples. With Muscat Hamburg, Mr. Day, Galloway House, took 1st prize with the beat of the kind in the show, being of excellent colour, and well-formed bunches; Mr. Boyd being placed 2nd. Mr. Day took 1st for Madresfield Court, with bunches extra well coloured; Mr. Murray following with larger bunches, rather deficient in this respect. The last-named was, however, to the front with Black Alicante of good finish and quality; Mr. Taylor came a very close 2nd, being finer in appearance, but hardly so ripe. Mr. Taylor won easily with Gros Colmar, showing extra bunches, well finished, and of first-rate colour, with berries extra fine in size. Mr. Potter, White Halls, Carlisle, was here a near 2nd, with two bunches of finer finish; Mr. Day came in a good 3rd, with two bunches of medium size.

For Lady Downes, Mr. Murray won again, with excellent bunches, of extra size and well finished, these were more thick and dense than is usual for this variety. Mr. Morrison, of Archerfield, was 2nd, with long tapering bunches of good colour. Mr. Green, Haddington, was 3rd, with bunches bearing splendid berries.

For any other black kind, Gros Maroc was placed 1st, being shown by Mr. Day, the bunches of medium size, but finely finished. Mr. Taylor came 2nd here, having larger bunches and much finer berries, but hardly so well-coloured, one bunch being also a little rubbed.

The next class was an important one, that of two bunches of Muscat of Alexandria, inasmuch, as it contained the two bunches to which the Veitch Memorial Prize and Medal was awarded for the most meritorious dish of fruit in the show. This, with the 1st prize in its class, was worthily awarded to Mr. McHattie, who staged two fine bunches perfect in colour, and of extra size, with large berries. Mr. Taylor was second, only lacking the colour of those in the 1st prize lot. Mr. Winter, Walk House, Hull, was a capital third, with clean bunches (13 com-

petitors). Mr. Potter won the 1st prize with good bunches of Buckland Sweetwater, finely coloured, Mr. Allan coming in second.

For any other white Grape, two bunches of Duke of Buccleuch from Mr. Copeland, Orwell Lodge, were placed first. These were of extra size in bunch, good in berry, and finely finished. Mr. McIndoe followed very closely indeed with similar bunches of the same variety. Trebbiano of good size and colour was placed third, coming from Mr. Potter. Golden Queen in this class was finely shown by Mr. Murray without its well-known failing.

For single bunches there was a quantity of good produce shown. With Black Hamburg, Mr. Morrison was first, showing the finest bunch of its kind in any of the classes, large in size, and berry also well coloured; Mr. Day following with an excellent sample very compact. Mr. Taylor secured the first prize for Black Alicantes with an extra fine bunch, which left nothing to be desired, Mr. Murray coming in second. With Lady Downes, Mr. Laing, Blairgowrie was first, with an extra fine bunch, well coloured, Mr. Murray being second with another good sample. Mr. Green, was first for Alwick Seedling, with a good bunch, having large and well-coloured berries, Mr. Murray being second, his berries being of medium size. A smaller bunch, with extra fine berries from Mr. Taylor, was placed third. An enormous bunch of Gros Maroc secured for Mr. Leslie, Pitcullen House, Perth, the first prize in its class, a little more thinning would have greatly improved this exhibit. Mr. Taylor was second with a finely finished bunch. Mr. McHattie was again invincible for a bunch of Muscat of Alexandria, showing an example equal to his other 1st prize ones. The 2nd prize in this class went to a comparatively small bunch, well coloured, from Mr. Green, the 3rd to a larger one from Mr. Wyton, Garstang. For the heaviest bunch of any black Grape in its class, Mr. Mattison, gr. to Mr. Buchanan Currie, was first with a huge cluster of Gros Colman weighing 12½ lb. This bunch was only partially coloured, requiring some weeks to have finished it, which it bore a promise of having done if not cut. The 2nd prize went to a large cluster of black Alicante weighing 11lb. 2oz., the 3rd prize being awarded to a large bunch of Barbarossa, the best finished of the three, the former from Mr. Leslie, the latter from Mr. Kirk. For the heaviest one of any white Grape, the 1st prize was awarded to a large ungaily bunch of Raisin de Calabre, from Mr. Morrison, the weight of which was not stated; the 2nd going to the same kind, from Mr. Hannah, Port Wilnam, the only merit being its weight. Amongst the classes for Grapes, the strongest exhibits were to be found in the collections of varieties. In the larger class, such well-known growers as Mr. McHattie, Mr. McKinnon, of Lasswade, Mr. Murray, of Maybole, Mr. Allan, of Ganton, and Mr. Leslie, of Perth, all showed fruit of excellent description. Although receiving no prizes, these exhibits all deserve recognition. Had they showed in the smaller classes, many of these productions would have stood in the front rank.

It would have saved the judges some considerable trouble in these classes if the bunches had been weighed beforehand. For one bunch of Madresfield Court, Mr. Taylor was 1st—fine in berry, bunch, and colour; Mr. McKelvie, gr. to Dowager Duchess of Roxburgh, Dunbar, a good 2nd. Mrs. Pince was very large in berry, and well finished, from Mr. W. Stewart, Brayton Hall; Mr. Murray coming 2nd. For Duke of Buccleuch, Mr. Chalmers, Dumfries, was 1st, with a medium-sized bunch, well coloured; Mr. Copeland 2nd. Mr. McIndoe was 1st for Golden Champion, with a good-sized clean bunch, with fine berries. The same exhibitor also took the 1st prize for the best seedling, not in commerce, with Black Duke, a cross between Gros Guillaume and Duke of Buccleuch. It partakes much of its first-named parent in the bunch, having also the long footstalk of that kind; the berries resemble the Duke, the flavour is first-rate, the skin rather thick, indicating its keeping qualities, much after that of the Black Hamburg, and, in the opinion of the judges, excellent. Mr. Murray, Culzean Castle, Maybole, was 2nd in this class with a seedling of which no information was given, it resembles Lady Dennes in berry with bunches after the Hamburg. For flavour the 1st was given in the black class to Muscat Hamburg from Mr. David Murray; the 2nd to Mr. McKelvie for Madresfield Court.

For the best flavoured white with Muscat of Alexandria in perfect condition, Mr. McHattie was 1st, the 2nd going to the same sort, from Mr. Winter,

Hull. Gros Maroc was placed 1st for bloom, extra dense, shown by Mr. Day, Galloway House; Mr. D. Murray being 2nd.

CLASS III.—GRAPES.

In this class (open to those who do not compete in the preceding) Mr. McDonald, Middleton House, is the winner for two bunches of Black Hamburg, good colour and ripe; the 2nd going to Mr. Collins, Stoney Hill, Walkertown. Black Alicantes: 1st to Mr. John Caldwell, Bangholm, with medium bunches well finished; 2nd to Mr. Harper, Dundas Castle, with larger bunches, hardly coloured sufficiently to win. Lady Downes: Mr. J. Caldwell won again with fine bunches, hardly coloured enough. Mr. Harper following him again, but closely. Muscat of Alexandria: 1st, to Mr. James Dobbie, Liberton, the bunches well coloured and fully ripened; Mr. McDonald came 2nd, with larger bunches very clean.

For single bunches, Mr. McDonald took 1st with black Hamburg, of fine colour; Mr. Collius, 2nd. Madresfield Court from Mr. Caldwell, was easily 1st, the bunch a fine one. The last-named exhibitor took 1st for black Alicante, with an extra fine bunch and fine in berry. Lady Downes, in perfect condition, from Mr. Jas. Cocker, easily won; Mr. J. Caldwell again 2nd.

For Gros Colmar, Mr. McLeod took 1st, with a small bunch well coloured; Mr. Cocker, 2nd, for a larger one wanting the finish.

For any other Black, Mr. Cameron was 1st, for Gros Maroc.

In Whites, Mr. J. Caldwell won again with Muscat of Alexandria, the bunch a fine one, but wanting colour. Mr. Auldjo, Mayfield, 2nd, with the same deficiency.

Mr. Cameron was 1st for Foster's Seedling, with a good example in colour and berry; Mr. Caldwell 2nd, with a larger bunch.

For any other sort of White, a splendid bunch of Duke of Buccleuch, with enormous berries, was easily 1st, from Mr. Scott, Beechwood; Golden Hamburg, not often seen so good, being 2nd, from Mr. J. Cocker.

For the bunch with finest colour, Gros Maroc was 1st, again coming from Mr. Crichton, Liberton. One bunch in this class was passed over by the judges, it certainly had the finest bloom, but it had apparently not been obtained by a natural method. Upon smelling the bunch, there was a most perceptible odour of sulphur found to pervade it. Such proceedings, when brought about by artificial means, should not be recognised, but, as in the present case, be passed over, and, if intentional, severely reprimanded by the judges.

CLASS IV.—FRUIT TREES IN POTS.

Vine Grown in Pot, Black.—There were but two competitors for this prize, but the quality was not first-rate, and the vines were badly trained. The 1st prize was awarded to Mr. A. Duil, gr. to Robert Bell, E-q., Clifton Hall, Ratho, with Gros Maroc; it had nine badly coloured bunches on it.

Pot Vine, White.—This class was rather better. Mr. Jas. Harvey, gr. to Col. Trotter, Morton Hall, was 1st, with Muscat of Alexandria; Mr. Bell being 2nd, with Rivers' New Sweetwater.

Four Fruit Trees in Pots were fairly good. Mr. J. McIndoe was 1st, with a good Sea Eagle Peach, an Apple, and two Pear trees.

Messrs. Cross & Sons, of Glasgow, showed well-grown fruit trees in pots, and samples of their fertilisers.

CLASS V.—FRUIT.

Pines in pots were not first-rate, but the two smooth-leaved Cayennes with which Mr. McIntyre won the 1st prize were fairly good. The same exhibitor was awarded the 1st prize for two handsome smooth-leaved Cayennes in the class for that variety. Mr. James Bennett, gr. to the Hon. C. H. Wynn, Rug Corwens was a good 2nd. Mr. McIntyre was 1st for Queens, and in the any other variety class, Mr. A. Kirk, gr. to J. T. Paton, Esq., of Alos, was 1st with Lord Carrington.

Mr. J. Hunter was 1st for a seedling Pine Apple not in commerce. For one bunch of Bauanas Mr. McIndoe was 1st with a good solid cluster.

Melons.—There was a good competition in the class for two melons. Amongst ten competitors Mr. John Wilson, gr. to Lord Elphinstone, Carberry Tower, was 1st with handsome fruit of La Favourite and Blenheim Orange.

There were thirty-six competitors in the next two classes for green and scarlet-flesh, many handsome well-ripened examples being shown. Mr. Wilson was again 1st in the former class, with La Favorite, and in the latter class, Mr. A. Millar (gr., to W. H.

Long, Esq., M.P., Rood Ashton), was 1st, with a superb example of Blenheim Orange.

Figs were well represented by eight dishes, Mr. Cruen, gr. at Castle Kennedy, being 1st with twelve handsome examples of Brown Turkey.

Peaches, Nectarines, and Apricots.—There were sixteen dishes of twelve Peaches, and twenty-four dishes of six. Mr. Thomas Lunt, gr. to A. Stirling, Esq., of Keir, winning in both classes, with remarkably coloured examples of Royal George. Many other meritorious dishes were exhibited.

Amongst twelve dishes of twelve Nectarines well-coloured examples of Eiruge, from Mr. Lunt, proved to be the best. There were fifteen competitors for the prizes offered for six Nectarines. The best were well-ripened Pitmaston Orange, from Mr. T. H. Crasp, gr. to Lord Wimborne.

There were twelve dishes of apricots, most of the fruit being of large size and well ripened, the best being twelve fruits of Moorpark, from Mr. G. Goodfellow, gr. to E. C. S. Gray, Esq., Perth. Mr. P. W. Fairgreive, gr. to the Duchess of Athole, was a good second.

Plums.—There were seventy-nine dishes of Dessert Plums, divided into six sections, amongst them being some well-ripened fruits, clean and of handsome appearance. The transparent Gage from Mr. P. Blair, gr. to the Duke of Sutherland, Trentham; Oullins Golden Gage, from Mr. S. Bowman, gr. to the Hon. Lady Deas, of Lasswade; the Greengage, from Mr. McIntyre, were very fine, and all were awarded 1st prizes in their sections. The variety Jefferson was well represented. Mr. A. Wilson, gr. to R. A. Oswald, Esq., of Auchencryve, had the best. Mr. Blair had also well-ripened fruit of smaller size. Kirke's was represented by twenty-one dishes of that variety. The best of them were from Mr. J. Day, gr. to C. J. Massey, Esq., Galloway House, Coe's Golden Drop, and other varieties were exhibited in somewhat smaller quantities.

There were sixty-five dishes of kitchen Plums, the favourite and best-grown varieties being Victoria and Magnum Bonum. In the former class Mr. Blair was first, and in the latter Mr. A. Wilson; Mr. James Harper, of St. Hellier's, Jersey, obtained a first prize for very good Pond's Seedling; Mr. McIndoe obtained the first prize for a collection of sixteen varieties of Plums, comprising good examples of Monarch, Grand Duke, Cox's Empress, Braudy Gage, Belle de Louvain, Pershore, &c.

Pears.—Pears were represented by some remarkably well-grown fruits. There were twenty-three dishes of Jargonelle, a favourite Scotch variety; but the 1st prize lot came from England, Mr. Crasp winning with astonishing examples of this variety. By far the best amongst seventeen dishes of William's Bon Chrétien were those from Mr. Harper, Jersey.

There were nineteen dishes of B-orné d'Amanlis, Mr. Harper being again 1st; Mr. Donald M. Bean, gr. to J. C. Cunningham, Esq., Rentreshire, was a good second.

Mr. Crasp beats Mr. Harper in the class for Louise Bonne of Jersey, both having large well-coloured examples.

The variety, Marie Louise, was represented by twenty-one dishes, none of them being ripe; but the specimens were of considerable merit. Mr. James Day, Mr. R. Sinclair, of Drum, and Mr. A. Wilson, winning in the order of their names. Of Winter Nels some were not true to name. By far the best of seven dishes were those from Mr. Harper. Hacon's Incomparable and Glou Morceau were poorly represented, Mr. Crasp winning in one class and Mr. Harper in the other.

Mr. Harper had the best Easter Benrié, and Mr. McKelvie, gr. to the Dowager Duchess of Roxburgh, Dunbar, the best Benrié Rance.

In the any other variety class, there was a good competition, twenty dishes being put up. Mr. Day was 1st, Mr. Gilmour, gr. to the Right Hon. J. G. Goschen, E-q., M.P., 2nd with Pitmaston Duchess, Mr. Crasp being 3rd with well-coloured Doyenne Boussoch. Altogether there were 139 single dishes of dessert Pears in competition.

There were nineteen dishes of stewing Pears, by far the best, being sent by Mr. Harper, who won two 1st prizes with Grosse Calabasse and Catillac. There were six collections of Pears, Mr. Harper being 1st, with handsome clean fruit, and Mr. Crasp, a good 2nd.

Dessert Apples were divided into eleven sections of single dishes, comprising the most popular varieties, in all 143 single dishes were staged of dessert Apples, the most popular varieties being Ribston Pippin, King of the Pippins, Irish Peach, and Thrie Pippin. The principal prize-winners were Mr. J. Nicholson,

gr. to W. Willes, Esq., Sewardston Lodge, Essex; Mr. Jas. Day, Mr. S. T. Wright, gr. to C. L. Campbell, Esq., Hereford; Mr. Craspe, Mr. John McKenzie, gr. to F. S. W. Cornwallis, Esq., M.P., Maidstone, and Mr. Harper.

Thirteen competitors entered the lists for twelve varieties of dessert Apples, but the quality throughout was not first-rate. Mr. John McKenzie was well 1st, most of his fruit being of good size, and well coloured; Mr. S. T. Wright was 2nd.

Kitchen Apples.—There were 177 dishes, and in these the best represented were Lord Suffield, Stirling Castle, Eclinville, Hawthornden, Tower of Glamis, Warner's King, Peasgood's Nonsuch, Emperor Alexander, Stone's Duchess of Oldenburgh, and Pott's Seedling. The leading prize winners in eleven classes being Mr. Goldie, Girvan, Ayrshire, Mr. Gilmour, Mr. McKenzie, Mr. Jas. Oulton, gr. to Chas. Lockhart, Esq., of Castle Douglas, and Mr. John McKenzie.

There were fourteen collections of Culinary Apples—12 dishes; the competition being very keen and the quality of the fruit good. Mr. McKenzie well deserved the 1st prize he won well with d'Éclat, The Queen, Bedfordshire Foundling, Yorkshire Beauty, Tyler's Kernel, Grenadier, Frogmore Prolific, Lord Derby, Mère de Ménage, Gloria Mundi, and Alexander. Mr. Gilmour was second.

Mr. McKenzie had the heaviest dish of Apples, a fine one of Peasgood's Nonsuch, weighing 10 lb. 12 oz.

There were thirteen competitors.

Strawberries were very good for the season. Six competitors staged dishes; the best was sent by Mr. Harper, gr. to Q. R. S. Richardson, Esq., Perth.

Gooseberries.—There were twenty-one dishes of Gooseberries, but none of the fruits were named. The best were sent by Mr. Maitland Forrest, gr. to Dr. Smith, Currie.

There were eleven dishes of Black Currants, twenty-four of Red Currants, sixteen of White Currants, thirteen of Raspberries, twenty-two of Cherries, and one of Brambles, the prize-winners in their order being Mr. E. Cameron, Mr. J. Brown, gr. to C. Wray, Esq., of Shercairay, Mr. D. Logan, Castlelaw Gardens, Coldstream, Mr. A. Hepburn, gr. to Major W. Ramsay, Killicoultry, and Mr. J. Harper.

CLASS VI.

Collections of Pears and Apples from France, Belgium, and the Channel Islands were represented by two very meritorious collections of each from Mr. Harper.

CLASS VII.—PLANTS.

Ten Store and Greenhouse Plants Distinct—Two competitors. An unequal contest; the first prize was awarded to Mr. W. Finch, Queen's Road, Coventry, who staged perhaps the finest lot of this kind that ever appeared in Edinburgh. *Ixora Williamsii*, and *I. amabilis*, *Lapageria rosea*, and *L. alba*, with *Erica Eweriana*, were the flowering plants; and *Croton Johannis*, and *C. Warrenii*, *Kentia Fosteriana*, *K. Belmoreana*, and *Cycas circinalis*, the foliage plants. Mr. A. Crichton, Southfield, Liberton, was 2nd.

Six Store and Greenhouse Plants.—No competition. Mr. Thomson, Eskbank, obtained the 1st prize, with a fair lot.

Eight Foliage Plants, distinct, pots not exceeding 10 inches.—In this section there were several exhibitors. The exhibits were of the half-specimen class, all good and fresh. Mr. McIntyre, The Glen, Inverleithen, was placed 1st; Mr. McIntyre, Darlington, 2nd; and Mr. Stewart, Brayton Hall, 3rd.

One Specimen Store or Greenhouse Plant.—Mr. Finch was here placed 1st with a grand *Ixora Williamsii*, truly a magnificent sample of plant cultivation. Mr. McIntyre, Darlington, was placed 2nd.

A table of plants 20 feet by 5 feet.—1st prize went to Mr. McIntyre, Darlington, who set up a very graceful table, well balanced in foliage and flowering plants. Mr. G. Wood, Oswald House, Edinburgh, was 2nd, with a table rich in well-coloured Crotons and other foliage plants; and Mr. Reynard, Ardenclotha, Hamilton, was 3rd.

One Cape Heath, only one entrant.—Mr. Finch, who set up a grand specimen of *Erica Marnockiana*.

Two Crotons distinct.—Mr. Stewart, Brayton, was an easy 1st with a splendid *C. Sunset*, and *C. angustifolius aureus*; 2nd, Mr. McIntyre, Darlington.

One Croton.—Mr. Stewart was here again an easy 1st, with a magnificent *C. Queen Victoriae*; and Mr. A. Thomson, Dean, 2nd.

Four Dracenas, in not less than 9-inch pots. Several entries. The best was staged by Mr. McIntyre, Darlington; 2nd, Mr. McIntyre, The Glen; 3rd, Mr. Harvey, Morton Hall, Midlothian.

Three Dracenas, in pots, not exceeding 6-in.

Here, Mr. Crichton, Southfield, Liberton, was placed 1st; Mr. McIntyre, The Glen, 2nd, and Mr. A. Thomson, 3rd.

Six Palms, distinct, in pots not exceeding 9-in. Numerous entries. The best was set up by Mr. McIntyre, The Glen, very clean well-grown stuff; Mr. McIndoe was placed 2nd, and Mr. G. Wood, 3rd.

Four Caladiums.—1st, Mr. Crichton; 2nd, Mr. G. Wood.

Six Table Ferns (in pots not exceeding 6 inches). 1st, Mr. McIndoe, won easily, with pretty plants of *Lomaria tripartita*, *Adiantum gracillimum*, *Gymnogramma chrysophylla*, *Pteris tremula Smithii*; 2nd, Mr. McIntyre, The Glen; 3rd, Mr. Fraser, Canaan Park, Edinburgh.

Six Exotic Ferns, Tree Ferns, Gleichenias and Adiantums excluded.—Mr. Napier, Rockville, Edinburgh, 1st, with a very clean lot of fine specimens; 2nd, Mr. G. Wood; 3rd, Mr. Crichton.

Three Gleichenias.—1st, Mr. McIntyre, Darlington; 2nd, Mr. Laing, Salisbury Green, Edinburgh; 3rd, Mr. J. Bald, Canaan House, Edinburgh.

Four Adiantums.—Many entries, all good specimen plants: 1st, Mr. Henderson, Polmont; 2nd, Mr. Lawson, Graigcrook Castle; 3rd, Mr. Henderson, Clermiston.

One Adiantum Farleyense.—1st, Mr. McIntyre, Darlington; 2nd, Mr. Green.

Todea superba.—Mr. E. Cameron, Ericstoane, Restalrig.

Six British Ferns, distinct varieties, large specimens.—Several entries—all good, 1st, Mr. Leman, Restalrig House, Edinburgh; 2nd, Mr. Napier; 3rd, Mr. T. Pringle, Westfield Cottage, Dalkeith.

Three British Ferns, distinct, large specimens.—1st, J. Napier; 2nd, Mr. E. Cameron; 3rd, Mr. W. Anderson.

Twelve British Ferns, distinct, in pots not exceeding 6 inches.—Several entries, closely contested. 1st, Mr. Scott, Canaan Lodge, Edinburgh; 2nd, Mr. Anderson, Pilrig, Edinburgh, and Mr. J. Cumming, Edinburgh.

Six British Ferns, dwarf, distinct, in 6-inch pots.—1st, Mr. J. Cumming; 2nd, Mr. W. Scott; 3rd, Mr. W. Fairley, Edinburgh.

Two Pans Lycopods.—1st, Mr. Henderson, Polmont; 2nd, Mr. Henderson, Clermiston.

Three Trichomanes or Hymenophyllum, distinct species.—1st, Mr. Napier; 2nd, Mr. A. Anderson.

One Tree Fern Stem, not less than three feet.—1st, Mr. Laing; 2nd, Mr. Pryde, Newington House, Edinburgh; 3rd, Mr. W. Stewart, Brayton Hall.

Six Orchids in bloom, distinct species.—1st, Mr. Sharp, Freeland, His group comprises excellent specimens of *Cattleya Gaskelliana*, *Laelia elegans*, *Cypripedium Veitchii*, *Odontoglossum Pescatorei*, and *O. vexillarium rubrum*; 2nd, Mr. Curror, Eskbank, with a very notable *Oncidium incurvum*, *Cattleya Gaskelliana*, *Miltonia Moreliana*, *M. spectabilis*, *Odontoglossum Harryanum*, and *Epidendrum prismato-carpum*.

Three Orchids, distinct.—1st, Mr. Wilson, Kelvin-side, Glasgow, with a remarkably fine *Odontoglossum grande*, *O. Pescatorei*, and *O. Alexandrae*; 2nd, Mr. Sharp, with *Cattleya Gaskelliana*, *Laelia elegans*, and a fine *Disa grandiflora*; 3rd, Mr. McGregor, Kendal, with a remarkable *Saccolabium Blumei majus*, having fifteen spikes badly balanced with the other components of the lot.

One Orchid.—1st, Mr. McGregor; 2nd, Mr. Sharp; 3rd, Mr. Wilson.

Twelve Tuberous Begonias, six single, six double distinct.—1st, Mr. Adams, Duddingston Cottage; 2nd, Mr. Pringle; 3rd, Mr. Henderson, Clermiston.

Two Tuberous Begonias.—1st, Mr. J. Duncan, Muirhouse, Boness; 2nd, Mr. J. Peason, Beechwood, Edinburgh.

Two Fuchsias.—1st, Mr. W. Anderson, Edinburgh; 2nd, Mr. Thomson, Eskbank; 3rd, Mr. Lyon, Blantyre.

Two Fuchsias, in pots not exceeding 8 inches.—1st, Mr. Anderson; 2nd, Mr. Douglas, Allanbank, Bonnyrigg; 3rd, Mr. Preston, Falcon Hall, Edinburgh.

Four Palms, distinct.—1st, Mr. Wood, Oswald House, Edinburgh; 2nd, Mr. Stewart, Brayton Hall; 3rd, Mr. McIntyre, Darlington.

One Palm.—1st, Mr. Ward; 2nd, Mr. Stewart; 3rd, Mr. McIntyre.

Six Table Plants, distinct.—1st, Mr. McIndoe; 2nd, Mr. McIntyre, Darlington; 3rd, Mr. McIntyre, The Glen.

Three Bronze Pelargoniums, distinct.—1st, Mr. Thomas Gibb, Redacres, Edinburgh; 2nd, Mr. David Adams; 3rd, Mr. Aiken, Balerno.

Three Zonal Pelargoniums, distinct.—1st, Mr. J. Fraser; 2nd, Mr. Gibb; 3rd, Mr. Lyon.

Three Variegated Pelargoniums, distinct.—1st, Mr. E. Cameron; 2nd, Mr. J. Fraser; 3rd, Mr. J. Forester.

Four Pots Chrysanthemum, Madame Desgranges, yellow and white, two of each.—1st, Mr. McMillan, Ferry Road, Edinburgh, with a very fine lot.

Four Pots Early-flowering Chrysanthemums, distinct.—1st, Mr. Chalmers, Lauriston Castle; 2nd, Mr. McMillan.

One Pot Eucharis amazonica.—1st, Mr. Mattison.

PLANTS AND CUT FLOWERS (NURSERYMEN).

Table Plants 30 feet × 8 feet.—The 1st prize for this very important exhibit is awarded to Messrs. Ireland & Thomas, Edinburgh, and generally acknowledged to be the finest table of plants ever exhibited in Edinburgh. The centre is relieved with fine palms of *Cocos Weddelliana*, *Geonoma racilis*, *Kentia Belmoreana* and *intermedia*, *Phoenix rupicola* *Alocasias* among others a new species), and others intermixed with *Crotons* represent a pleasing combination. *Crotons* are remarkable for their brilliant colour, Prince of Wales standing prominently above other plants as extra fine and much admired. *Dracenas*, *Asparagus*, *Marantas*, *Ferns* (especially *Adiantums*), *Davallias*, *Lastreas*, *Lomarias*, *Pteris*, &c., are well represented. *Anthuriums*, *Liliums* of sorts, *Eucharis*, *Odontoglossums* and *Cattleyas*, lighten up the foliage plants, and a margin of *Panicum variegatum*, *Caladium Argyrites*, *Cypripediums* form a pleasing and beautiful finish to this meritorious table of plants. Messrs. Thyne, of Glasgow, were placed 2nd with a table brilliant with *Odontoglossums* (the great profusion of these no doubt weakened a very fine exhibit), *Cattleya grandis*, and *Oncidium*, interspersed with *Liliums*, *Crotons*, *Dracenas*, *Cocos Weddelliana*, *Ferns*, &c., form a very imposing table—a line of *Caladium Argyrites*, back a line of *Isolepis gracilis*, which would have been more effective with creeping plants intermixed, formed the margin of the table.

Messrs. Laird, of Edinburgh, are 3rd with a very tastefully arranged collection in circular groups along the centre. *Crotons*, *Palms*, *Ferns*, and *Panacratium* were the most effectively arranged, and a margin of *Panicum Lycopods*, dwarf *Palms*, with *Ficus repens* form a tasteful finish.

Twelve Conifers, distinct.—The 1st prize was awarded to Mr. Butler, nurseryman, Greenock, who exhibits finely grown plants of the following, all in fine condition—*Retinospora pisifera aurea*, very finely coloured; *Cupressus Lawsoniana pyramidalis*, fine graceful form, contrasting finely with golden plants on each side; *C. Lawsoniana alba spica*, nicely tinted with yellow foliage; *C. Lawsoniana* var. *Fraserii*, *Retinospora obtusa*, fine species; *Thuopsis Nootkatensis*, *Pinus cembra rosafolia* (a distinct species); *Taxus elegantissima*, a neat plant; *Retinospora Lycopodoides* were all represented in this exhibit in fine form; Messrs. Laird, Edinburgh, had a good 2nd, in which *Retinosporas*, *Thuias*, *Junipers*, and *Pinuses* were represented in healthy well grown condition; Messrs. Stuart & Mein, Kelso, were 3rd, with a good collection.

Six Crotons.—The 1st prize was awarded to Messrs. B. Williams, of Holloway, with a fine centre plant of *Queen Victoria* (bush form), *Comtesse Warrenii*, *Formosus*, *Rodeckianus*, and *Williamsii*. Messrs. Ireland and Thomson are placed 2nd, with splendidly coloured specimens of *Prince of Wales*, *Marrion of Wales*, *Warnerii*, *Evansianus*, *Newmanii*, and *angustifolius*. Some comments by disinterested parties were made on the awards in this class.

Six Orchids.—1st prize awarded to Messrs. Ireland & Thomson, for the following:—*Cypripedium Ashburtonii*, *Vanda Kimballiana* and *cerulea*, *Odontoglossum vexillarium* and *grande*, in fine form; *Cattleya Gaskelliana*, finely bloomed. There was no exhibitor for 2nd prize.

For Six New and Rare Plants, not in commerce prior to January 1, 1889.—The 1st prize was awarded to Messrs. Ireland & Thomson, for *Cocos Pynaertii*, *Maranta Mooreana*, *Alocasia Thomsoni*, *Caladium Marie Freeman*, *Dracena* sp., and *Nepenthes Dicksoniana* ×; 2nd, Messrs. Williams, for *Cattleya Mossiana* (of gigas type), *Anthurium eburneum*, *Dracena*, *Dicksonia Lathamii*, *Alocasia Chantreirii*, *Pteris tremula elegans*; 3rd prize to Messrs. Laird for *Alocasia Lindenii*, *Asparagus plumosus cristata*; *Dracena Duchess of Portland*, finely coloured crimson and green, &c.

Twelve Plants for Table Decoration.—1st, to Ire-

land & Thomson, for a choice lot of finely-coloured Crotons (Golden Ring and Prince of Wales), Palms, Dracenas, and Pandanus. The 2nd and 3rd prizes were awarded to similar exhibits of much merit, Mr. B. S. Williams and Messrs. Laird being 2nd and 3rd in the order named.

Four Specimen Plants.—1st, to Messrs. Laird; and 2nd, to Messrs. Thyne for fine clean specimens.

For two Tree Ferns.—The 1st prize was awarded to Messrs. Dickson & Co.; and 2nd to Messrs. Laird.

CUT FLOWERS.

Twelve Spikes of Pentstemon.—Mr. Sampson is awarded 1st; and 2nd is Messrs. Stewart & Mein.

Six Chrysanthemums.—1st, Messrs. Laird (only exhibitor), for blooms of Edwina Molyneux, Mme. Desgranges; Mrs. G. R. Pitcher, Duchess of Buccleuch, G. W. Wirmig, Mdle. La Croix.

Twelve Spikes of Hollyhocks.—1st prize to Messrs. Alex. Kerr & Sons, Roxburgh, who had fine Gem of Yellows, Czar, Purple Prince, and Mrs. Edgar; 2nd to Messrs. Stewart & Mein; and 3rd to Geo. Wood, Hawick.

For Twenty-four Show Dahlias.—1st to Mr. R. B. Laird, who had fine John Hocking (yellow), Duke of Fife, Clara, Lustrous, Mrs. Langtry, and Mr. Gladstone; 2nd to Messrs. Clark & Son, Leeds, Mr. Gladstone, R. T. Rawlings, Henry Keith, and William Rawlings, were in fine bloom; the 3rd prize is awarded to Mr. Walker, Low Fell, Gateshead.

For Fancy Dahlias.—1st to Messrs. H. Clark & Son, who have a clean exhibit of fine blooms; Mrs. Sanders, Sunset, Prince Henry, and John Forbes, were among the best; 2nd prize awarded to Mr. Campbell, Blantyre; and 3rd prize to Messrs. R. B. Laird & Co.

Thirty Gladioli.—1st prize awarded to Mr. Campbell, Blantyre; they were a fine lot—Enchanters, Sceptre de Flore, Gigantem, Leviathan, Shakspeare, and Mr. Hardy, are of special merit. 2nd are awarded to Messrs. Stewart & Mein, with fine varieties, similar to those in 1st prize lot, and also of much excellence.

Thirty-six Roses.—1st prize awarded to Mr. Cocker, of Aberdeen, for an excellent collection exhibited in prime order, and greatly admired. Waban was exhibited for the first time in this country (an American variety), a blush-pink of great promise; Alfred Colomb, Her Majesty, Ulrich Brunner, Lady Mary Fitzwilliam, Duc de Rohan, Emily Haushburgh, Dr. Andry, Madame Eugénie Verdier, Marie Rady, Suzanne Rodocanachi, Madame Chas. Crapet, Comtesse de Serenye, Charles Lefebvre, Mrs. John Laing, A. K. Williams, La France, Marshal P. Wilder, Marie Verdier, Etienne Levet (considered the best on the board), Duchess of Bedford, Madame Hoste, Marie Magot, Marie Van Houtte, Duke of Edinburgh, Lady Ailsa, Earl of Dufferin, Viscountess Folkestone, Anne Wood, Marie Baumann, Souvenir d'Elise Vardon, Paul Jamain, Catherine Mermet; 2nd prize goes to Mr. Dickson, Belmont, for a fine collection, such as is so often seen from that firm; 3rd, to Mr. Smith, Stranraer, for an exhibit of much excellence.

For twenty-four Roses, 1st prize awarded to Mr. Cocker; and Mr. Smith, Stranraer, 2nd.

Twelve Trusses of Tea Roses.—Three of each. Mr. Cocker again led in this class, and Mr. Smith was 2nd.

Thirty-six Single Trusses of Dahlias.—Messrs. Laird have a fine exhibit, and are the only exhibitors in this popular class.

CLASS VIII.—CUT FLOWERS.

Cut flowers generally were a fine feature of the show. In the competitive classes—Hollyhocks, Dahlias, Marigolds, Pansies, Gladioli, &c., were all in presence in splendid form. Roses were also good, considering the season, and the wretched character of the weather.

Twelve Roses, distinct.—1st, Mr. Adam Brydon, Innerleithen; 2nd, Rev. W. Thompson, Kinglassie Manse, Fife; 3rd, Mr. J. Mellinder, Worksop.

Twenty-four Roses, distinct.—1st, Mr. A. Hill, Gray, Bath, Somerset; 2nd, Mr. D. Wallace, Rothesay; 3rd, Mr. Wm. Parlane, Golffhill, Ross.

Twelve Tea Roses, not fewer than six varieties.—1st, Mr. A. Hill, Gray; 2nd, Mr. Mellinder; 3rd, Mr. Brydon.

Twelve Fancy Pansies, distinct.—1st, Mr. A. Ollar, Campbellton; 2nd, Mr. W. Storrrie, Lenzie; 3rd, Mr. W. Adam, Blantyre.

Twelve Fancy Pansies, distinct.—1st, Mr. McCann, Cumnock; 2nd, Mr. Ollar; 3rd, Mr. Adam.

Twelve Bunches Violets, distinct.—1st, Mr. Frater,

Linlithgow; 2nd, Mr. Paterson, Linlithgow; 3rd, Mr. Sutherland, Slateford.

Twelve Trusses Chrysanthemums, not less than six varieties.—1st, Mr. Pearson.

Four spikes East Lothian Stocks.—1st and 2nd, Mr. Morrison, Archerfield.

Twelve Bunches Herbaceous Plants, distinct.—1st, Mr. J. Stewart, Lily Bank Cottage, Lennoxtown.

Eighteen Gladioli, not less than twelve varieties.—1st, Mr. J. Coulter, Warkworth, Northumberland.

Seven Spikes, Hollyhocks, distinct.—1st, Mr. R. T. Rae, Roxburgh.

Twelve Blooms, Hollyhocks.—1st, Rev. J. Middleton, Crailing.

Eighteen Show Dahlias, distinct.—1st, Mr. Spoor, Musgrave Cottage, Low Fell.

Twelve Show Dahlias, distinct, sent out by Keynes, Williams & Co.—1st, Mr. Spoor.

CLASS IX.—DINNER-TABLE DECORATIONS.

Only one exhibitor who shows a neat arrangement with choice flowers, chiefly Orchids and Ferns, in glasses, with a scroll on the cloth—a centre-piece (silver bowl) somewhat crowded, is filled with Orchids, mostly Cattleyas, pink Roses, and Ferns. The fruit is in small dishes—Pines and Melons at ends, black and white Grapes, at the sides—with Peaches at corners. The simplicity of this table is its strongest recommendation, it is effective and creditable to Messrs. Tod & Co., Maitland Street, Edinburgh.

CLASS X.—VEGETABLES.

Vegetables are remarkable for quality and quantity. For a collection of twelve distinct varieties, Mr. Pope, gr. to Earl Carnarvon, Highclere, Hants, was 1st; this exhibit was very fine, and comprised seventeen lots of twelve distinct varieties, Leeks and Celery being very fine, and shown in all the collections. The judges had much difficulty in deciding, the 1st lot, having fine Standard Bearer Celery, Green Globe Artichokes, Lord Keeper Onions, Ne Plus Ultra Beans, Satisfaction Potatos, Autumn Mammoth Cauliflowers, Duke of Albany Peas, New Intermediate Carrots, Perfection Tomatos, Student Parsnips, and Pragnell's Beet, with Oxonian Leeks, the Leeks being much shorter than in many of the collections. 1st, Mr. Pope, gr. to Earl Carnarvon, Highclere Castle, Hants; 2nd, Mr. J. Mair, gr. to Miss Talbot, Port Talbot—this was an excellent exhibit; Dobbie's Champion Leek, Veitch's Early Rose, Celery Eclipse, Cauliflower Cardiff Castle, Cucumber, Anglo-Spanish Onion, Veitch's Scarlet Model Carrot, Ne Plus Ultra Bean, Webb's Sensation Tomato, Duchess Pea, Yellow Turnip, Blood-red Beet, Satisfaction Potato. In this lot the Onions, Cauliflowers, Cucumbers and Potatos were very fine dishes, also Carrots and Leeks, and as near equal to 1st as possible. 3rd, Mr. Wilkins, gr. to Lady Theodora Guest, with very fine Ailsa Craig Onion, Giant White Celery, Lyon Leek, Autumn Giant Cauliflower, rather too large, New Intermediate Carrot and Satisfaction Potatos being the best dishes, these being very choice, followed by Cheltenham Green Top Beet, Ne Plus Ultra Beans, Lockie's Cucumber, Duke of Albany Peas, Perfection Tomato, and Student Parsnip. 4th, Mr. W. Harper, gr. to J. R. S. Richardson, Esq., Perth, and comprising some excellent samples of good culture, wonderful Leeks, Parsnips, Turnips, and Carrots, good Potatos and Beans, and considering the enormous competition in this class it was a most meritorious collection. There were others worthy of notice did space allow of doing so, these collections forming a most attractive exhibition.

Collection of Twelve Distinct Varieties.—1st, Mr. James Cocker, gr. to Sir William Wallace, Bart., Stranraer, with excellent Cabbage, Cauliflower, Onions, Peas, Turnips, well-grown Leeks, and Celery; 2nd, Mr. J. Low, gr. to J. Paton, Esq., Stirling, the best dishes being Onions, Carrots, Peas, Leeks, and Beet, this lot being little behind the 1st; 3rd, Mr. G. Potter, gr. to Mrs. Laidlay, North Berwick.

Two Cucumbers.—1st, P. Blair, gr. to the Duke of Sutherland, Trentham. The 1st lot was a new seedling sort, of a beautiful shape, deep green, and little spines with no neck; this will become a favourite exhibition Cucumber. 2nd, Mr. McIndoe, gr. to Sir J. Pease, Hutton Hall, with Lockie's Perfection.

The lot exhibited by Mr. Wiles, Banbury, should perhaps have been before those awarded the prizes. Mr. Pope also had a nice lot.

Six Varieties of Potatos.—1st, Mr. Gentleman, Armadale; 2nd, Mr. J. McFarlane, Barnard Cot-

tage, Alva; 3rd, Mr. Wiles, Banbury; and here we should have reversed the awards, Mr. Wiles' being free of spots, and a beautiful shape. Many of the Potatos shown were Snowdrop, Abundance, The Dean, Satisfaction, Reading Russett, Poritan, Matchless, Vicar of Laleham, Lord Tennyson, Best-of-all, Village Blacksmith, Mr. Breese, Lady Truscott, Edgecot Purple, and Matchless.

CLASS XI.

Vegetables, Market Gardeners.—1st, Mr. Anderson, Aberdeen, with immense Cabbages, good Turnips, Leeks, Carrots, and Cauliflowers; 2nd, Mr. John A. Murie, Craignullar Gardens, Edinburg, with a large collection, but smaller in size; 3rd, Messrs. Kerr & Sons, Edinburg.

CLASS XII.

SPECIAL PRIZES.

Including a variety of prizes offered by Messrs Sutton & Sons for products of their sending out.

Best Single Melon.—Duchess of Athole, 1st (Mr. Fairgrieve, Dunkeld), with Monarch, a nice fruit, well netted; 2nd, Mr. Harvey (Colonel Trotter, Morton Hall), with a green Monarch; 3rd, Mr. J. Day, Gallopway House, with a smaller fruit, but of exquisite flavour.

Messrs. Dobbie & Co., Rothesay, also offered prizes for collections of vegetables. 1st, Mr. McBean, gr. to J. C. Cuninghame, Esq., Johnstone; this was a grand lot, and splendidly grown, not a weak dish, 2nd, Mr. D. Logan, Castlelaw, Coldstream; 3rd, Mr. Fender, Crieff. There was a large number exhibited, and among them some most meritorious lots.

In the collection for amateurs only, Mr. Wm. Goodall, Errol, Perthshire, was 1st, with good Turnips, Onions, Celery, and Parsnips; 2nd, Mr. J. Henderson, Lurbert, very good Leeks, Celery, and Onions; 3rd, Mr. Hutchinson, Falkirk.

For the prizes offered by Mr. John Wilson of Hereford for Cranston's Excelsior Onion, there was a large competition among the growers of large bulbs for these prizes, some of them being of large size. For autumn sown, Mr. J. Forest, Lanark, was 1st with perfectly shaped bulbs; 2nd, Mr. J. Gray, Newfield, Kilmarnock; 3rd, Mr. Wiles, Banbury. For spring sown, 1st, Mr. J. Gray, Newfield; 2nd, Mr. J. Cocker, Stranraer; 3rd, Mr. Sharp, Freeland. A nice lot of vegetables occupying a large space was sent from Mr. J. Taylor, Bangholm Nurseries, also five large baskets of Apples.

Messrs. Deverill, Banbury, exhibited twenty-one large dishes of Onions of their celebrated strains, also Carrots and Oxonian Leek. The Onions were the finest in the show, and were prize-takers in several places, having been selected by Mr. Deverill for this exhibition, and were of great size and well finished, being of a good colour, so deficient in most Onions this damp season.

SPECIAL EXHIBITS.

These are numerous, of great extent, and made up the fine non-competing objects which helped to fill the main area of the building.

Taking flowering and foliage plants first, we find Messrs. J. Laing & Sons, Stanstead Park Nurseries, Forest Hill, Kent, with a table 30 feet by 5 feet, filled with novelties in Crotons and Caladiums; Begonias as cut blooms, seedling Begonia plants taken from the open ground, and a quantity of decorative plants in variety. Fine Caladiums were Raymond Lemoine, Mrs. Harry Veitch, La Lorraine, and Isis Rose. Strikingly coloured Crotons were Eugène Chantrier, Nestor, Inimitable, and Emperor Alexander.

Mr. John Downie, nurseryman, Edinburg, has a table 20 feet by 5 feet, filled with tuberous Begonias in variety, very robust plants, and good colours. Messrs. W. Cutbush, Highgate, London, a similar table with Bonvardias, Lilies, Palms, Ferns, &c.

Two Carex species were worth special mention, C. japonica variegata, a dwarf graceful plant, with very narrow leaves, having a wide margin; and C. j. marginata, a plant with similar leafage, but 1½ feet high.

Well-fruited Apple, Pear, and Plum trees, together with kitchen-garden produce, and fruit, were shown by Messrs. Alex. Cross & Sons, Glasgow.

As only W. J. Birkenhead can show them, was remarked a notable lot of hardy and exotic Ferns, mostly rare and of much beauty. We may mention Gymnogramma schizophylla gloriosa, a variety with partially pendant divaricate fronds; Gleichenia dicarpa longi-pennata, a good plant entirely lacking in coarseness; Polystichum Braunii, Cyrtomium attenuatum, Lygodium scandens, and Japonicum very graceful species. One of his tables was filled with a

representative collection of British Ferns having deviations from the types in the form of crested or tasselled fronds. A large table was set out by Messrs. T. Methven & Sons, Edinburgh, with Crotons, Dracenas, Lilies, Palms, Adiantum, and bordered with Caladium argyrites and Panicum variegatum.

The exhibit of Messrs. B. Williams & Sons, Upper Holloway, London, was remarkable for the rarity of most of the plants. These included Cyripedium, Nepenthes, Sarracenia, Phrynium variegatum, a Ginger Wort with green and white variegated leaves, Croton Princess Waldeck, a yellow and green leaf, very effective; Dracena Doucetti; Aralia spectabilis, a stove species with very long stiff, pinnate, fern-like foliage, and Phoenix Robellini.

A very miscellaneous exhibit was that of Messrs. Dickson & Co., Waterloo Place, Edinburgh. It consisted chiefly of Lilies, cut Roses, Phlox, Bouvardias, Pansies, Carnations, Begonias, Tree Ferns, Conifers, Dahlias, and a great mass of decorative plants for the border or greenhouse.

Messrs. J. Dickson & Sons, 32, Hanover Street, Edinburgh, had a small collection of Conifers, inclusive of variegated Cupressus, Thuja dolabrata, Araucaria, Japan Maples, and Euonymus.

Cactus Dahlias formed the backbone of the large area occupied by Messrs. H. Cannell & Sons, Swanley, Kent, and these were set up in flat bunches of six blooms each, and in great variety. Begonias of the best forms, growing in 48's, well bloomed and dwarfed, were also shown by them.

Mr. J. Cocker, Aberdeen, had a very fine collection of Carnations, Picotees, Pansies, the white La France Rose, Auguste Guinoisseau; and many other show boxes filled with Roses of excellent quality.

Mr. J. Forbes, Hawick, showed Begonias, Hollyhocks, Crimson Bedder Anterrinum, and show and border Carnations; 200 varieties of Dahlias, sixty-four of Violas, and many French and African Marigolds, together with selected kinds of Celery, Leek, Onions, &c.

Messrs. Hugh Dickson, Belfast, had boxes of Rose John Laing in fine form for the season. Messrs. Stuart & Mein, Kelso, made a display with Hollyhocks, Lilliums, Michaelmas Daisies, &c.

Mr. H. Deverell, Banbury, filled a large space with his enormous bulbs of onions, his Ailsa Craig taking first prize and a gold medal. A plentiful collection of Apples, Pears, and bottles of Cyder and Perry was supplied by Mr. John Watkins, Hereford.

The collection of hardy flowers from Mr. Cuthbertson, nursery near Rothesay, is deserving of special mention for the good things it contained. There were Senecio pulcher, Cimicifuga racemosa, Eucomis punctata, Mimulus Pansy Mistress Cuthbertson, a purple flower of perfect shape, having yellow margin, Centaurea Orientalis atropurpurea Veronica longifolia var. subsessilis, the best for autumn; Ecomicon chionantha, with white Poppay-like flowers, and leaves like the Coltsfoot; Dracoccephalum austriacum, a fine flowering autumn border plant, rosy purple flowers in long spikes; Chelone obliqua, &c.

Dahlias, Carnations, show and border varieties, Pansies, Hollyhocks came in quantity from Mr. Campbell, Bantyre. An exhibit similar in character came from Messrs. Laing & Mather, but this one included some designs in flower gardens, with beds filled with self-coloured Carnations. Messrs. F. Sander & Co., St. Albans, showed a life-sized picture of the true and rare Cattleya labiata vera, the autumn flowering species supposed to have been lost. All the forms of it, ranging from white to rosy purple, were shown in the picture. Another picture was of the rare and beautiful Dendrobium Phalenopsis var. Schroderiana, which came once to Kew many years ago, and has not been reintroduced.

The exhibit of Messrs. W. Thomson & Sons, Clovenfords, was a large one, consisting of Dracenas, Crotons, Aralias, Palms, Sarracenas, Ferns, Caladiums. Interspersed were groups of fruit in variety to show the excellence of the Clovenfords' manure. Little groups of choice species and varieties of Orchids added richness to the whole.

The Royal Horticultural Society sent from the Gardens at Chiswick fifty dishes of Apples, a collection of fruits of Plums and Tomatos—a good and correctly-named lot.

Sussex Apples were shown by Mr. Rust, gr., Eridge Castle, extensively; also some Pears, showing much rust, and Plums.

Mr. J. Walker, Cam Farm, Surrey, showed a collection of Apples, many of grand size and good quality, especially early ones. Pears, also shown largely, were clean and good, although, in some instances, not fully grown.

A large and very fine lot of Apples came from Messrs. G. Bunyard & Co., Maidstone, size and colour good.

An equal amount of space was taken up by Messrs. Cheal & Sons, Crawley, Sussex, with Apples; he also showing twenty-six dishes of Pears. Dahlias were likewise shown by this firm.

Mr. Alex. Lister, Rothesay, showed Pansies (200) of show quality, fancy mostly; Asters, Marigolds, and Matricaria inodora, with largish flat flowers.

Mr. J. R. Thyne, Kelvin Grove, Glasgow, had a mixed table of plants, but largely consisting of Odontoglossum crispum, various Cattleyas, Lilies, Crotons, Ferns, &c.

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon.

Will some reader who has had special experience, be so kind as to name a few of the best plants to grow for flowers and foliage in a rather dark greenhouse in the midst of London? *Baconian*. [We can speak for Fuchsias, hardy Ferns, Camellias, and bulbous plants such as Roman Hyacinths, Crocuses, &c.]

Will any of your correspondents kindly give their experience of Pyramid Apple and Pear-growing, with pruning and cultural directions, as there seem to be many different opinions on this matter? *B. B.*

NOTICES TO CORRESPONDENTS.

. Owing to the extreme pressure on our space, many communications and reports of societies are held over.

Books: *A. B. Williams' Orchid Manual* (Williams, Upper Holloway); *Baines' Greenhouse and Stove Plants* (Murray).—*G. P. Oliver's Lessons in Elementary Botany*; *Masters' Botany for Beginners*.

CRLERY DISEASE: *S. C. L.* The plants are attacked by a fungus, *Puccinia bullata*; pick off all infected leaves, and burn them.

CATERPILARS: *D. S.* No. 1, not received; No. 2, spring canker-worm (*Anisopteryx vernata*), when mature, burrows in the ground—the female moths are wingless; No. 3, Blind-eye Sphinx (*Imerianthus exocatus*); this, when mature, also burrows—it is comparatively rare.

GRAPES SHANKING: *A. B. C.* The cause of this is generally some error in the cultivation. See correspondence in back numbers of this journal.

MARKET MEASURES: *D. O. C.* Chicago, full details are given annually in the *Gardeners' Chronicle*, in one of the early numbers. Half-sieve = 14 imperial quarts; Tasmanian Apples, case containing 250; Cherries, Gooseberries, half-sieve = 14 imperial quarts; Lemons, case, 240 to 250; Celery, bundle = 20 heads; Mushrooms, punnet = basket 7 inches across 1 inch deep; Mustard, ditto; Seakale, basket, 12 to 18 heads; Turnips, bundle, one dozen; New Potatos, 6s. to 8s. per cwt.; old Potatos, £7 per ton of 20 cwt. = 2240 lb. Get your countrymen to adopt the sensible metrical system, or any that is uniform and not so exasperatingly idiotic as our own.

NAMES OF FRUITS: *W. F.* Peach Bellegarde.—*W. W.* 1, Purple Gage; 2, Denyer's Victoria; 4, Lawson's Golden; smallest Damson, the Farleigh; the larger Damson, Shropshire; 6, decayed. *T. C.* English Codlin.—*Old Subscriber.* 5, cannot recognise; 6, Jargonelle.

NAMES OF PLANTS: *G. W.* Begonia leaves, 2, Adolphe Pollack; 3, President de Burelle; 4, Héène Under; 5, Splendens; 6, Duc de Brabant.—*Nemo.* Cornus mas.—*S. R.* Lung (*Calluna vulgaris*).—*E. M.* 1, Galeopsis Ladanum; 2, Linaria minor; 3, Bartsia odontites. The fungus on leaves of Bartsia is the teleutospore stage of *Coleosporium euphrasie*.—*J. K.* 1, Impatiens Roylei; 2, Phyllis capensis.—*H. E.* Your specimens have been mislaid, please send others.—*Old Subscriber.* 1, Rosa rugosa; 2, Thalictrum majus; 3, Achillea ptarmica, double; the Phloxes send to some nurseryman.—*L. C.* 1, Galeandra Devoniana; 2, Mormodes buccinator atropurpurea.—*G. C.* The specimens were withered beyond recognition.—*H. R. H.* *Lælia crispa*.

PEARS CRACKING: *A. W.* The cracks are due to a fungus which attacks and kills the superficial parts of the Pear. This being so, the outer parts cannot grow in proportion to the inner parts, and the pressure they exert in their growth causes the dead and dying portions of the rind to crack.

VINE BORDERS AND TRENCHING:—*H. B. P.* In a general way, the staple soil of a garden or field is not fit for Vine growing. It may be good as far as the top goes, but being shallow, and having a subsoil of an infertile character, its depth of good soil must be increased by the addition of fertile soil from a distance. Supposing that there is a depth of 3 feet of good soil, the workman in trenching should not, at the most, throw more than two spits upwards, that is, he would leave the middle spit at the same depth as it was before digging, merely moving it forward the width of the trench, and the top soil should remain at the top, and be inverted only, the bottom soil being deeply dug and left *in situ*. Much will depend on the proper method of trenching the land, or only bad results will follow. It is a great mistake and a common one to turn the best soil—the upper layer, to the bottom of deep trench, and out of all ready approach of the roots of plants, by one or two layers of soil deficient in plant food. In kitchen gardens which have been long under the spade, this cannot well occur, and deep trenching is usually followed by good results. In new land, the depth of good soil is best increased by merely bridging an inch or two of the unmoved subsoil to the surface about once in three or four years, and always putting rough dung, garden refuse, &c., at the bottom of the trenches. This mode of bringing about the amelioration of the soil is gradual, but it is effective.

VINES TURNING BROWN: *J. F.* The young shoots are affected with Vine mildew (*Oidium*). Dust them with sulphur-powder, and paint the pipes with sulphur.

WILLOWS: *G. N.* It is almost impossible to say what they are, but certainly neither of them is ordinary *S. caprea*. We will endeavour to name them next week.

COMMUNICATIONS RECEIVED.—*J. R. R.*—*J. H.*—*M. de Candolle*, Geneva.—*F. D.*—*P. L. S.*—*J. S.*—*H. W.*—*A. P.*—*P. L. S.*—*A. S. M.*—*E. C.*—*J. M. McF.*, Philadelphia.—*A. B. M'D.*—*H. H. D'O.*—*E. H. K.*, Haurlem.—*R. Br.*—*E. T.*—*J. B. T.*—*W. & S.*—*D. McA.*, Melbourne.—*R. A. R.*—*H. T.*—*L. C.*—*J. B. W.*—*Soboy*—*H. E.*—*G. K. G.*—*M. F.*—*G. N.*—*R. S. G.*—*H. T.*—*Ted.*—*J. A Z A L E A S.

Hardy Hybrid Seedlings, a cross between *A. mollis* and a large-flowered seedling occidentalis, and also the best of the Ghent varieties. They are nice bushy plants, about half of them having flower-buds, and from our long experience in hybridising, we feel sure many will be beautiful novelties. Price 18s. per doz. Our *A. mollis* Seedlings and other choice kinds are well set with buds. Our Rhododendrons, both hardy and greenhouse varieties, are nice bushes, well budded. Catalogue free by post.

BEGONIAS.

WHOSE ARE THE BEST?

If evidence were needed, there was abundance when face to face at the PALACE SHOW last week. We wish all lovers of flowers could have heard the continual exclamations of the spectators that thronged our exhibits. The greatest experts also pronounced our plants and blooms raised from seed sown last February the most extraordinary by far ever shown. Brilliant Scarlets, Yellows of the highest and brightest tints, and Whites of the greatest purity, these uncommon colours predominated, giving a richer tone to the whole group, together with their erect gigantic blooms and perfect shape not more than a few inches from the pot—struck all by surprise. We wish all to

Our wonderful display, and we will point out, with all the eulogy passed upon them. Our best were at home for seedling at this moment, the great hybridizing skill and care being bestowed upon them, enabling us to surpass all other varieties, and thus add a general pleasure and charm for all lovers of the garden.

THE "CLIMAX"

CONCENTRATED

WEED KILLER

Is Double the strength of any other.

Destroys all weeds on Garden Walks, &c., &c.
Improves the colour of the Gravel—has no smell.
Saves many times its cost in labour alone. One application will keep the walks clear of weeds for a whole season at least. Can be applied with an ordinary watering-can.

Note the strength, & compare the price with others.

1 Gallon makes 51 Gallons for use.
PRICE IN TINS:—1 gal., 3s.; 5 gals., 2s. 9d. per gal.; 10 gals., 2s. 6d. per gal.; 20 gals., 2s. 3d.; 40 gal. casks, 2s. per gallon.
Carriage paid on all orders of 10 gallons and upwards.

TESTIMONIALS.

The Gardens, Moygallon House, Gilford,
May 21, 1891.

DEAR SIR,—I have carefully tried the Moss Eradicator and Insecticide you sent me. The Eradicator is splendid. It does its work quietly and thoroughly, and doesn't seem to injure the grass in the least.

It is certainly the best preparation for destroying moss I have ever seen.

(Signed) Yours faithfully,
JAMES LYNAS.

THE "CLIMAX"

MOSS ERADICATOR

Is Guaranteed to effectually Destroy all Moss on Lawns, &c., while at the same time it will stimulate and increase the Growth of the Grass.

1 Gallon as sold will make 15 Gallons for use, and is sufficient to do 110 square yards. Can be applied with an ordinary watering-can. Saves many times its cost, and insures a perfect sward.

PRICE IN TINS:—1 gallon, 3s.; 5 gallons, 2s. 9d. per gallon; 10 gallons, 2s. 6d. per gallon; 40 gallon casks, 2s. 3d. per gal.

Oakbank, Comrie, Perthshire,
May 7, 1891.

DEAR SIR,—In reply to your favour, I have thoroughly tested your Moss Eradicator, and find it what you describe. I consider it a most valuable preparation, and when better known will be extensively used; whilst it completely kills the moss, in my opinion, it also acts as a stimulant to the grass.

(Signed) JOHN STRACHAN, Florist.

PREPARED SOLELY BY THE

BOUNDARY CHEMICAL CO., LTD, 211, GREAT HOWARD STREET, LIVERPOOL.

Can be had through all Seedsman, or Chemists. Ask for the "CLIMAX," and take no other.

THE
"PERFECT"
WEED KILLER

Unrivalled for Destroying Weeds on Garden Walks, Carriage Drives, Stable Yards, etc.

Recommended by the entire Horticultural Press. Supplied to Her Majesty's Commissioners of Works and used regularly at Kew Gardens, etc.

Price—
Gallon 2/5, 5 gal. 1/3, 10 gal. 1/6, 40 gal. 1/4 per gal. Carriage paid on 10 gallons and upwards.

Used in the proportion of 1 gallon to 25 gallons of Water.

SOLE MANUFACTURERS: THE
HORTICULTURAL & AGRICULTURAL CHEMICAL CO.
Works: 97 MILTON ST., GLASGOW.

CAUTION.—Please carefully note our name, address, and trade mark, and do not be deceived by imitations and apparently lower prices of inferior articles. Our manufactures cannot be obtained genuine at Tunbridge, Kent, except from our Agents, Messrs. WILMER & WARDLEY, Chemists there.

THE STOTT

SPECIALTIES for DESTRUCTION OF INSECT PESTS.

PATENT DISTRIBUTOR.

Letter received from The Earl of Lisburne.

S. Wales, June 29, 1890.
Sir.—Am very well pleased with the Distributor; it does its work well, and is a most useful invention.—Yours faithfully,
LISBURN.

PATENT SPRAYER.

Extract from letter from Mr. G. Norman, Gardener to The Right Hon. The MARQUIS OF SALISBURY.

The Gardens, Hatfield House, Herts, April 20, 1891.
Sir.—I am pleased to report that I consider your Distributor a very useful invention.

PATENT SYRINGE.

Extract from letter from R. White, Esq., Arddarroch, Garelloch Head, Dumbartonshire.

July 20, 1891.
I consider the Syringe bought from you one of the cheapest and best I ever had. It is especially good for spraying Odontoglossums.

KILLMRIGHT.

Extract from letter from Mr. J. Young, Head Gardener to the Zoological Society, Regent's Park, London.

July 22, 1891.
It is the best Insecticide I have ever used, and the cheapest.

FEEDMRIGHT.

Extract from Letter from Mr. T. Wise, Gardener to F. TAYLOR, Esq., Ash Lawn, Heat n, Bolton.

September 20, 1890.
Your Patent Manure has given us every satisfaction.

TESTIMONIALS and PRICE LISTS on application.

Retail from Ironmongers and Seedsmen. Wholesale and Retail from the STOTT DISTRIBUTOR CO. Ltd., Barton House, Manchester.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburg.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

Sold in Packets, 6d. and 1s. each, and in Sealed Bags Only.
7 lb., 2/6; 14 lb., 4/6; 28 lb., 7/6; 56 lb., 12/6; 1 cwt., 20/-

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first-rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

GARDENER (HEAD); married; has small family.—Mrs. HENRY BRASSEY wishes to recommend her Head Gardener, who is leaving on account of the death of the late Mr. H. A. Brassey, as above. Thoroughly experienced in all branches, Forcing, &c. Thoroughly honest, and abstainer.—Apply, Preston Hall, Aylesford, Kent.

GARDENER (HEAD).—KIPPS, late Head Gardener, &c., to W. H. Bingham Cox, Esq., Torneo, seek re-employment, near London preferred. No encumbrance.—Newgate Street, near Hertford.

GARDENER (HEAD).—Age 42, married, no family; experienced in all branches of Gardening, Early and Late Forcing, and General Management of good establishments.—W. D., 2, Alberta Place, London Road, Bishop's Stortford.

GARDENER (HEAD), in good establishment; fifteen years' experience.—J. C. McPHERSON, Gardener to the Right Hon. the Earl of Lonsborough, would have great pleasure in recommending his Foreman (G. Gurney), who has been with him four years, to any Lady or Gentleman requiring the services of a good all-round man.—Londesborough Park, Market Weighton, Yorkshire.

GARDENER (HEAD); age 38.—Mr. WILLIAMS, Gardener to the Earl of Lisburne, Crosswood Park, Aberystwith, can with confidence recommend a thorough practical all-round man as above. Life experience in first-class places. Eight years in last as Head. Excellent testimonials.—Apply as above.

GARDENER (HEAD); age 33, married.—WILLIAM MASKELL, Head Gardener to William Wells, Esq., of Holme Wood, Peterborough, would be glad to hear from any Lady or Gentleman requiring the services of a practical man as above. Life experience of Gardening in good establishments. Cause of leaving death of employer. Good references.—W. MASKELL, Danbill Farm, Steep, Petersfield, Hants.

GARDENER (HEAD).—A. MILNE, Gardener to the Right Hon. Earl Ashburnham, Battle, Sussex, can with confidence recommend his Foreman as an energetic workman and good all-round man.

GARDENER (HEAD), in a good establishment. Fifteen years' practical experience. W. WHIMBERLEY, Gardener to Sir Philip Grey Egerton, Oulton Park, Tarporley, wishes to recommend his present Foreman, Chas. Thomas, to any Nobleman, Lady, or Gentleman, requiring a good all-round man as above.

To Gentlemen and Market Growers. GARDENER (HEAD), or MANAGER and GROWER for Market.—Age 43; well up in Grapes, Peaches, Melons, Tomatoes, Cucumbers, all kinds of Cut Flowers; Chrysanthemums a specialty; also Wreaths, Crosses, Sprays, Bouquets, &c. High-class testimonials, and good personal character.—HEAD GARDENER, Hawthorn Bank, Spalding.

GARDENER (HEAD), and ORCHID GROWER.—Age 31; seventeen years' experience in Orchids, Stove and Greenhouse Plants, early and late Forcing, hardy Fruit, Flower, and Kitchen Gardens. — **WILLIAM LAKEE**, Quorn Lodge, Loughborough, Leicestershire.

GARDENER (HEAD).—Age 30, married; thoroughly competent and trustworthy. Thorough knowledge of the growth of all descriptions of Fruit, Flowers, and Vegetables. Well recommended by a Gentleman employer, who is well-known in London, for the above capacity. — **G.**, Gardener, 27, St. Augustine's Road, Camden Square, N.W.

£10 BONUS.—Anyone procuring the Advertiser a situation as **HEAD GARDENER**. Large place not necessary. Good all-round man. Excellent testimonials. Age 45, married, no family. — **HORTUS**, Booking Office, Sydenham Station.

GARDENER (HEAD), where two or more are kept.—Married, one child; thoroughly understands Gardening in all its branches, with a fair knowledge of Orchids. Nine years' good character from last employer. Total abstinence of long standing. — **C. W.**, John Solomon, Queen's Road, Walthamstow, Essex.

GARDENER (HEAD).—Age 37, married, one child, aged 9 years; has had twenty-two years' good practical experience in all branches. Highly recommended as competent and trustworthy. Excellent testimonials. Please state full particulars. — **MANN**, Church Street, Shoreham, Sussex.

GARDENER (HEAD), and ORCHID GROWER.—Age 30; sixteen years' experience in Orchids, Stove and Greenhouse Plants, Early and Late Forcing, Fruit, Flower, and Kitchen Gardens. Four and a half years last place. — **C. W. SURMAN**, Lower Aston Lodge, Eynsford, Kent.

GARDENER (HEAD WORKING), where three or more are kept.—Age 32, married, two children; a thorough practical good all-round man. Eighteen years' experience in all branches. Character will bear strictest investigation. — **GARDENER**, J. Newman, Floss House Gardens, Keighley, York-shire.

GARDENER (HEAD WORKING).—Age 38, married, no family; thoroughly experienced in all branches. Good reference from last place. — **H.**, 5, Upper Orchard Street, Brixton Hill, S.E.

GARDENER (HEAD WORKING, OF SINGLE-HANDED).—Age 31. Practical experience in all its branches. Nine years' good character. Knowledge of cows. — **W. L.**, Sedgemoor, East Finchley.

GARDENER (HEAD WORKING), where three or more are kept.—Age 35, married, one child (age 2); twenty years' experience in all branches of Gardening. Disengaged when suited. Character will bear the strictest investigation. — **J. R.**, 19, Chesham Road, Peckham, S.E.

GARDENER (HEAD WORKING); age 28, married.—**MR. OFFER**, Handross Park, Crawley, can with confidence recommend his Foreman to any Lady or Gentleman requiring a good practical all-round man as above. He has been with him four years.

GARDENER (HEAD WORKING), where more are kept. Good practical experience in all branches. Excellent character. Ab-tainer. — **GARDENER**, 29, Stadium Street, Ashburnham Road, Chelsea, S.W.

GARDENER (HEAD WORKING), where one or two others are kept.—Age 19, married; thirteen years' experience in Vines, Peaches, Apples, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Good character. — **G.**, Mr. Bart, Albert Road, Cosham, Hants.

GARDENER (HEAD WORKING).—Age 36, married; twenty years' experience in all kinds of Fruit, Flowers, and Vegetables, Early and Late Forcing. Wife us Landress if required. Good character, and well recommended. — **B. S.**, Croxley Grove, Rickmansworth.

GARDENER (HEAD WORKING).—The Advertiser seeks an engagement with any Lady or Gentleman requiring the services of a thoroughly competent Gardener. A life's experience in all branches of the Garden. — **J. MARSH**, Crookham, Newbury.

GARDENER (HEAD, OF SINGLE-HANDED).—Age 30, married, one child; disengaged. Thoroughly practical. Inside and Out. Excellent character and testimonials. — **MACK**, 2, Homestead Villas, Riverdale Road, Plumstead, S.E.

GARDENER (SINGLE-HANDED), or where another is kept, good practical experience of Plants, Fruit, Flower, and Kitchen Gardening. Age 31, married, four years in present and ten years in previous situation. Good references. — **W. B. BELL**, 46, Durham Road, Cottenham Park, Wimbledon.

GARDENER (SINGLE-HANDED, or otherwise); age 40, married.—A LADY can recommend as above. Thoroughly understands the routine of Gardening. Total abstainer. — **D. D.**, Coffee Tavern, Bookham, Surrey.

GARDENER (SECOND OF SINGLE-HANDED).—**J. AKERS**, Head Gardener, Tynawr Gilwern, Aber-gavenny, can recommend a young man as above.

GARDENER.—A GENTLEMAN wishes to recommend a gardener who is a good all-round man. Understands Vinery, Orchard-house and Conservatory, Chrysanthemums, Fruit, Tomatoes, and kitchen gardening, also horses, cows, pigs, poultry, and carpentry. Thoroughly honest, sober and industrious. Wages very moderate. **H. D.**, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER, where two or more are kept; age 27.—A GENTLEMAN wishes to recommend his Gardener as above. Twelve years' experience in large establishments. — **SLATER**, Colton Lodge, Tadcaster.

GARDENER.—Age 30, married; good all-round. Would not object to good SINGLE-HANDED. Four years' excellent character. — **A. S.**, 2, Lime-tree Cottages, Lower Mitcham.

GARDENER, where help is given, or SINGLE-HANDED. Age 28. Ten years' experience, good character, and references. — **S. W.**, East Norton, Leicester.

GARDENER.—Age 44; good, thoroughly experienced. Wife thorough Landress. Two years six months' good character. — **A. B.**, New Town, Hatfield, Herts.

SHOPMAN or MANAGER. Age 28. Experienced in all branches, including Wreaths, Bouquets, Sprays, Bulbs, Seeds, &c. Could manage Branch. Excellent references. — **EUCHARIS**, 93, Acre Lane, Brixton.

DR. LOCOCK'S PULMONIC WAFERS.—We continually hear of the most surprising recoveries from consumption, asthma, bronchitis, and disorders of the lungs, through the use of Dr. Locock's Pulmonic Wafers. It is certain that nothing else could give such a refreshing night's rest. They taste pleasantly.—Of all Druggists, at 1s. 1/2. per box.

HOLLOWAY'S OINTMENT and PILLS.—Never at fault.—In all irritations of the skin, sores, ulcers, burns, and scrofulous enlargements of the glands, Holloway's Ointment presents a ready and easy means of cure, which never disappoints the most favourable expectations. It manifests a peculiar power in restraining inflammation, removing stagnation, cooling the heated blood, and checking all acrimonious or unhealthy discharges. Whilst thus acting locally, the Pills are no less remarkable for their power in improving the general condition and habit of body, which renders the cures complete and permanent. Under the general influence of these potent remedies, the puny infant becomes the robust child; the pale and emaciated regain colour and rotundity; and the dyspeptic eats freely without fear.

THOMSON'S

IMPROVED

VINE, PLANT, & VEGETABLE MANURE.

NONE IS GENUINE THAT DOES NOT BEAR
OUR NAME ON THE SACK.

AWARDED ONLY MEDAL
FOR
ARTIFICIAL MANURES
AT
EDINBURGH INTERNATIONAL EXHIBITION, 1886.

This Manure, on its own merits, has come rapidly into extensive use. The materials it is composed of are of the highest manurial value, and so balanced as to combine immediate with lasting effects. It is a safe and certain Manure for every fruit-bearing plant from the Vine downwards, as well as for Pot Plants and Vegetables.

Working.
PRELIMINARY NOTICE of an UNUSUALLY IMPORTANT
SIX DAYS' SALE of the exceptionally well-grown NUR-
SERY STOCK, in the finest possible condition for trans-
planting, and embracing the most important lot of stock
offered for Auction for many years, the quality of which
is unsurpassed in the Trade.

GREAT UNRESERVED SALE by order of the Trustees of the
late Mr. George Jaekman.

MESSRS. PROTHEROE AND MORRIS
respectfully give notice of this extensive SALE which
has been fixed for MONDAY, October 12, and FIVE FOLLOW-
ING DAYS, further particulars of which will appear in
future Advertisements.
The Auctioneers have personally visited the nurseries and
desire to call attention of intending purchasers to this Sale, as
it is undoubtedly the most important Auction of Nursery
Stock that has been held for many years.

An inspection will well repay a visit by those contemplating
planting during the season.
May be viewed. Catalogues had on the Premises, and of the
Auctioneers, 67 and 68, Cheap-side, E.C.

On view morning of Sale, and Catalogues had.

Portland, near Shrewsbury. To NURSERYMEN and OTHERS.

MESSRS. LYTHALL, MANSELL, AND WALTERS have been instructed by the Trustee of the Will of H. J. Oldroyd, Esq., deceased, to SELL by AUCTION, at the George Hotel, Shrewsbury, on MONDAY, September 23, 1891, at 4 for 5 o'clock, p.m., in one or two Lots as may be determined at the time of sale, the attractive and very valuable FREEHOLD RESIDENTIAL PROPERTIES known as PORTLAND HOUSE and PORTLAND NURSERIES.

The charmingly-situated and desirable Freehold Residential Property known as PORTLAND HOUSE, standing in its own grounds, with Stabling, Pleasure Grounds, and productive Kitchen Garden, comprising an area of 1a. 1r. or thereabouts, and within one mile of the centre of the town of Shrewsbury, famed for its Royal Free Grammar Schools, which afford unrivalled educational advantages. The residence, which is well-built, and in good order, contains Entrance Hall, 3 Reception Rooms, viz., Dining Room, Drawing Room, and Breakfast Room; 8 Bedrooms, Bath Room, with hot and cold water supply; Lavatory, and w.c., Large Kitchen, Back Kitchen, Housemaid's Pantry, Larder, Beer and Wine Cellars, Apple Room, Pantry, and Coal House. Gas is laid on in each room in the house, Pump for hard water, and Tanks for soft water. There is a Coach House for 3 carriages, 2 Loose Boxes, with Hay-lofts over.

Tennis Lawn and Pleasure Grounds are tastefully arranged and planted with choice specimens of ornamental trees and shrubs, and, having for many years been in the hands of the late proprietor have received more than usual attention.

Kitchen Garden is productive and well-stocked with fruit trees of the choicest specimens of Pears and Apples known, and has good old-established Asparagus beds. The Property is now in hand, and possession will be given upon completion of purchase. It has a south aspect, and the approach to the town is through the best and most fashionable part.

Also a Valuable Property adjoining the above, for many years known as PORTLAND NURSERIES, comprising a substantial Modern Residence, containing Entrance Hall, Dining Room and Drawing Room, four Bedrooms, Kitchen, Back-Kitchen, w.c., Cellar, Yard, &c., with Greenhouses, Brick Pits, Potting-House, Offices, Out-buildings, and Nursery Ground, the whole comprising an area of 4 acres, or thereabouts, let on lease to a highly respectable and thriving tenant, and, as such, is a splendid opportunity of securing a sound and permanent investment.

To be viewed by Cards only, to be obtained of the Auctioneers. N.B.—If desired, a portion of the Purchase Money can remain on Mortgage at 4 per cent.

The Property will be sold subject to Conditions of Sale. Copies of the printed Particulars, with Plan, View, and the Conditions of Sale, may be had on application to Mr. GEORGE POWELL, Solicitor, Upton-upon-Severn; or Messrs. LYTHALL, MANSELL, and WALTERS, College Hill, Shrewsbury, and Bingley Hall, Birmingham.

MESSRS. BYRON and RANGELEY are instructed by J. Burton Barrow, Esq., Ringwood Hall, near Chesterfield, Derbyshire, to SELL by AUCTION as above, on WEDNESDAY, October 7, 1891, a very valuable collection of STOVE and GREENHOUSE PLANTS, including Palms, Azaleas, Camellias, Ferns Tea-scented and other Roses, and a choice collection of many other varieties.

Catalogues are in course of preparation, and can be had from the Auctioneers, 5, Low Pavement, Chesterfield, on week previous to Sale.

Nursery Stock—Three Days' Sale by Auction. MR. H. J. E. BRAKE will SELL by AUCTION, to Clear Ground for Building, on WEDNESDAY and THURSDAY, September 23 and 24, close to Fleet Station, Hants; and FRIDAY, September 25, at Farnborough, at 1 for 2 o'clock.

King's Acre Nurseries, near Hereford. IMMENSE SALE of UNUSUALLY WELL-GROWN FRUIT AND FOREST TREES, &c. Without the least reserve. As a portion of the Land will shortly be offered for Sale for Building purposes, it is absolutely necessary to clear the ground.

ALEXANDER, DANIEL, SELFE, AND CO., will SELL by AUCTION, on the Premises, as above, on TUESDAY, WEDNESDAY, and THURSDAY, October 20, 21, and 22, 1891, at 11 for 12 o'clock precisely, several acres of first-class NURSERY STOCK. Further particulars in future announcements, but the stock may be viewed at once. Catalogues may be obtained at the Nurseries; or of the Auctioneers, Corn Street, Bristol, and 31, Old Jewry, London, E.C.

Notice. HIGHLY IMPORTANT FIVE DAYS' UNRESERVED SALE of beautifully grown NURSERY STOCK, all well-rooted, and carefully prepared for removal, and specially selected for the Sale. By order of Messrs. Isaac Matthews & Son.

MR. JOHN OAKS, Ash, will SELL by AUCTION, on the Premises, at the far-famed Baginbun Tite Oaks and Milton Nurseries, on OCTOBER 21 and FOLLOWING DAYS, without reserve, several Acres of NURSERY STOCK, grown to the highest perfection. The Nurseries are in an extremely cold situation, and all the trees are perfectly hardy, and grown to the highest perfection. Extremely well-rooted and well-furnished Hoigens, Common, Maderiensis, Silver, and Guild Hollies in variety, 1,000,000 Rhododendrons various, a large quantity of all leading varieties of Conifers, Evergreens, &c., suitable for Ornamental Planting, Parks, Cemeteries, Pleasure Grounds, &c. Large quantities of Thorn, Quack, Ash, Elm, Alder, Privet, Austrian Pines, Spruce Fir, Chestnuts, Willows. All other trees for Woods and other plantations.

Catalogues seven days prior to Sale on application to the Nurseries, Milton, Stoke-on-Trent. Milton is the nearest station, L. & N.W. Railway. All trains met.

To Gardeners and Nurserymen.

TO BE SOLD, the LEASE of a GLASS NURSERY, in full working order. Genuine bargain.—Apply, by letter, to Mr. NOPLEY, 240, Barry Road, Dulwich, S.E.

FOR SALE.—The LEASE of a small NURSERY, about eighteen years to run. Ground rent, £2 8s per year. Three Span-houses, 33 feet each; one bank, 36 feet; one ditto, 52 feet. G. HABBERT, 16, Grove Lane, Camberwell, S.E.

To Nurserymen, Florists, Tomato, Cucumber, and GRAPE GROWERS.

FOR SALE, owing to retirement of owner, a BIJOU FREEHOLD NURSERY, in one of the most fashionable and rising suburban places. One Acre of Land, compact Seven-Roomed Cottage, 14 Glass-houses, heated with hot-water; Stabling, &c.; every convenience for carrying on the business. Net Profit, for many years, upwards of £300 per annum. Price for the place as it stands, £1,150—a large amount can be left at 4 1/2 per cent. Is suitable for a general emman. Apply, by letter, to Mr. DAVISON, 3, Circus Place, E.C.

GENUINE SEED and FLORIST BUSINESS, situate main-road position. Large double-fronted Shop and 6-roomed House, with Greenhouse 34 feet by 13 feet; lean-to Conservatory, and stabling at rear. Doing nearly £2000 per annum. Lease over ten years. Price £300. Stock and Fixtures (with Horse and Van) at valuation. There is also a Nursery within five minutes' walk of above, containing 1 large Greenhouse, 61 feet by 15 feet, with room to build others; Stabling and Shed, &c., which can be rented. Purchaser can have immediate possession. Satisfactory reasons for leaving. Apply to R. PEKITT, Estate Agent and Valuer, 41, Wellington Street, Woolwich.

NURSERY BUSINESS, FOR SALE, together with about 3 acres of rich loamy land, with glass-houses and pits, packing shed, offices, store, work room, &c. The land is well laid out in quarters, borders, and beds, with hedges for shelter and ornament, situated close to the south coast, and within half a mile of an important railway junction. There is a very rapidly-increasing population, already amounting to over 200,000 within a twelve-mile radius. The land is admirably adapted for the erection of more glass-houses, for the production of supplies for local and distant markets. The climate is similar to that of Worthing, where so much horticultural produce is raised. Plenty of good land adjoining, to be hired on advantageous terms. A large stock of fruit and ornamental trees, shrubs, Roses, &c., can be taken at a valuation, if desired. There is a HOUSE, containing six bedrooms, three reception rooms, &c., standing in its own grounds of half an acre, joining the Nursery, also for Sale. Apply, E. H., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

FOR SALE, or LET, a FREEHOLD. About 3 acres of this old-established Nursery, in good position, between Weybridge and Chertsey, Surrey. A good opening for an energetic man. Ten minutes walk from Chertsey or Addlestone station. South-Western Railway; in a rapidly increasing neighbourhood. For particulars, enquire of—W. DALE, Knockholt, Kent.

EXETER.—In a splendid situation. A genuine FLORIST'S and FRUITERER'S BUSINESS, doing a good cash trade, which might readily be much increased. Rent of Shop, Show-Room, and Sitting ditto, £40 per annum. Price for Goodwill, Fixtures, Fittings, Stock, &c., £75. A capital business for two Ladies, or anyone desiring to acquire a lucrative concern. Apply to THOMPSON, RIFFON AND CO., Business Brokers, 25, Gandy Street, Exeter.

EXHIBITIONS.

CRYSTAL PALACE GREAT AUTUMN EXHIBITION OF FRUIT.

OCTOBER 8 to 10. ENTRIES CLOSE OCTOBER 1. Schedules and Entry Forms post-free, on application to Mr. W. G. HEAD, Superintendent, Gardens Department, Crystal Palace, S.E.

TO LET, LARGE GARDEN, with VINERIES, &c.

The Garden at Mable, within about 4 miles of the town of Dumfries, with Cottage and small Field, are TO LET for such period as may be agreed on, with entry at Martinmas first. The Garden and field extend to about 3 acres each. The Glass-houses are extensive, and consist of two Vineries, two Peach-houses, two Melon-houses, large Conservatory, and long Corridor; and the Garden is well stocked with Fruit Trees and Bushes.

The Gardener, Mr. William McMinn, will show the Premises, and further particulars may be learned from Messrs. WALKER AND SHARPE, Writers, Maxwelltown, Dumfries, who will receive offers till FRIDAY, the 25th September current. Maxwelltown, September 8, 1891.

SATURDAY, SEPTEMBER 19, 1891.

FERNS, AND THEIR MULTIPLE PARENTS.

COLONEL JONES and myself read a joint paper on "Abnormal Ferns," at the Bath meeting of the British Association, and this has been printed with illustrations in the third volume of the *Annals of Botany*. The paper showed that any particular character of one variety could be imparted to any other variety, and as a fact, the polydactylous character in the Shield Fern has been transferred to the sections known as decompositum, acutilobum, divisolobum, alatum, lineare, and congestum. It was further shown, that a hybrid had been obtained between, *Aspidium angulare* and *A. aculeatum*, the cruciate character of a variety of *A. angulare* having been transferred to *A. aculeatum*. It is right to say, that some botanists consider the two as one species. Hybrids are more or less sterile, whilst crossed varieties have no diminished fertility, and the fact that this plant is almost sterile seems unquestionably to raise these two Ferns to the rank of species, independently of the many important distinctions. The paper further stated, that by sowing the spores of different varieties together it was possible to obtain hundreds of intermediate forms.

Colonel Jones and Mr. E. F. Fox were to me two valuable assistants, who repeated and verified all my Fern experiments. Since the Bath meeting, death has carried both away, and at the present time I have no other help. The paper to-day is a further report of these experiments, and of the astounding discoveries that have resulted. The space on a lecture-table is inadequate to exhibit all the specimens that could have been brought in illustration. At Bath, Colonel Jones and myself had a large tent containing 2000 varieties of British Ferns, and it had been suggested that such an exhibition, on an even more extended scale, should this week have found a home at Cardiff, especially as the bulk of the wild finds, and all the crosses, belong to South Wales, and those counties extending from South Wales to Cornwall. Many of the Ferns were exhibited in London on September 8, at the meeting of the Royal Horticultural Society. See *ante*, p. 310.

Since 1857, other hybrids have been obtained, and although these hybrids are more or less sterile, a few plants (grandchildren of the original parents) have been raised, and they differ so much from the parent, that nearly all resemblance has disappeared. What will be the characters of the great-grandchildren is now in course of proof. There is no difficulty in the case of the offspring of crossed varieties; they

!! MUSHROOM SPAWN !!

FOR THE BEST, send to

C. H. RICHARDS, 1, Belvedere Crescent, Lambeth, London, S.E.

One out of many Testimonials:—"The 20 bushels of Spawn I had from you for our Mushroom Farm, at Peole, has proved very satisfactory; in fact, the best I have ever had.—T. H. CRASP, Canford Gardens."

are very fertile, and when sown alone reproduce their varietal form.

The following fronds show the varieties of *Aspidium angulare* and *A. aculeatum*, from which the hybrid was obtained, the hybrid itself, and two of the grandchildren. It will be seen the latter are of diminished size, and have a rough appearance that is absent in both the parents and the hybrid.

Not only have certain forms been imparted to other Ferns, but even variegation. I have obtained it in the male Fern, the Shield Fern, and the Hartstongue; in the latter, spores from a normal but variegated form were sown thickly with a plumose and a branching form. The examples before us are plants of the parents and their offspring—both the plumose and the branched varieties have become variegated. This frond of the Shield Fern and that of the *Adiantum* form a third.

In repeating the experiments of mixed spores to again verify what had previously been accomplished, the varieties in each case have been limited to three and four, so that the resultant changes could be more narrowly investigated. There were selected varieties of a number of species—in short, twenty-five distinct mixtures were sown in 1887, 1888, 1889, and 1890, and the results in all the experiments established the fact, that the antheridia of more than one variety have assisted in the impregnation. To-day, illustrations of three varieties and of four varieties have been selected for inspection. Those with four varieties were sown in January, 1888, and those with three in March, 1889. The varieties selected had conspicuously distinct characters, and in the example of 1888 the spores were gathered from a dwarf spiral form, a muricate or warty form, an undulate, and a ramose one; more exactly speaking, the varieties were spirale, undulatum, muricatum, and keratoides. The plants are here, as well as three of their children, and the latter have received the names of *echinatum*, *quadriparens*, and *Darwinianum*, the last in honour of a great philosopher, the plant being produced whilst working under his guidance in the capacity of an ordinary labourer.

Let us examine these illustrations obtained from four very dissimilar varieties, they will speak for themselves; in two the characters of the four parents are combined in each plant, and in the third only three. In the hundreds of these seedlings, as might be expected, the majority show only the characters of two parents; on a less, though considerable number, of three, whilst a small number exhibit those of the four parents. The plants in the 1889 experiments are yet small, they are from a muricate, a branched, and a cup-bearing form known as *periferens*; the object being to obtain cups on a branching muricate Fern, as this was a desideratum. There was no previous example of more than one cup on a frond. You will observe in the seedlings, though yet diminutive, a divided frond with cups on each division, a tasselled Fern with a rosette in place of an actual cup; and in another example, a marginal row of small cups, and all are muricate. When the plants are larger, the characters will be more developed. A further experiment from spores sown in July, 1888, of three varieties, viz., *periferens*, *muricatum*, and *pectinatum* (the latter not in my possession), has produced plants of a pectinate and muricate character, but instead of a cup there are small cups on stalks. It is worth remarking that the seedlings from mixed spores never seem to produce any plants that exactly resemble any one single variety, they are all combinations; in other words, a number of antheridia, and not a solitary spermatozoid, are required for the fertilisation.

Understand, that where only two varieties have been sown together, the result has only been a combination of the two, varying more or less according to which predominate: if three only, a combination of the three; whilst if four, there are examples of the combination of all four. In sowing varieties of the Lady Fern, I have raised the combination of five and six, which will be alluded to in my paper on the "prothalli."

These plants that give evidence of multiple parentage were obtained in the identical manner formulated before they had any existence. The only requisite knowledge is care in sowing the spores so thickly that the prothalli intermingle; if thinly sown they are only fertilised from the same prothallus. If we take the reasoning of Sir John Herschel on the doctrine of probability, and apply it to these experiments, the chances against the reasoning adopted being incorrect are as great as that of the hap-hazard distribution of the stars.

The experiments were commenced forty years ago. A firm belief in the Darwinian theory influenced me to persevere in a series of experiments regarding the changes in animal and plant life. All the assertions are based on my own observations, which have been very diverse. Horses, cows, sheep, pigs, dogs, cats, rabbits, swans, turkeys, geese, fowls, ducks, toads, slugs, dragon-flies, flowering plants, and Ferns have each been studied. To the latter we are today confined; still I should like to mention (to some extent) two confirmatory cases—one with animals, and the other with flowering plants. Experimenting on the *Mimulus*, a yellow flower was crossed with a spotted one, and the seedlings were spotted; later on, and further up the same stem, two blooms were this time crossed with a yellow one, but the seedlings were still spotted—the effect of the first cross had become a part of the life-history of the plant. In a second experiment, the same plant was simultaneously crossed with pollen from two other varieties, and several of the seedlings are a combination of the three. To accomplish this cross it required dexterity, as the pistil of the *Mimulus* is as sensitive as the sensitive *Mimosa*.

Turning to animals, a white sow was crossed with a black Berkshire, and the young were black and white; subsequently, one of the red Tamworth breed was substituted, and this time the young were red, black, and white, although there was no black in either parent. It made no difference whether the change was with the male or female. We have now seen the stepping-stones to gradual alteration. Some of these changes will have a diminution of strength, and these the more robust will crowd out—hence the fittest will survive.

The great theory of Darwin requires no defenders, it is a truth that has asserted itself. Natural changes are slow, but culturally we can accelerate the process that continues age after age. The germ once changed retains its new element, which becomes combined with others until the normal appearance is lost. The illustration of the Hartstongue has shown you this alteration, helped on as it were by artificial means that have accelerated the process, and these changes will continue whilst the world lasts.

Affectionate respect causes tablets to be erected in memory of the departed; age obliterates these records. It is, however, far different with the philosopher who has discovered great truths, for he has erected a monument to himself "more lasting than brass." Time wears away the hardest rock, but it will require the crumbling of this world to obliterate the truths that have been taught by Charles Darwin.

FACTS REGARDING THE PROTHALLI, AND THE PROPAGATION OF FERNS.

Occasionally, in a batch of seedling Ferns, there will occur plants of some strongly-marked variety, identical in their characters, and growing so closely together that it is difficult to separate them. I have long suspected that these were produced on the same prothallus; indeed, this seemed evident in four instances of remarkable seedling *Athyriums*, yet the development was too far advanced for absolute certainty.

To examine this carefully, a number of *Scolopendrium*s were planted in the prothallus state, and on the young fronds appearing, two were noticed identical in character, and unusual in form, which, when examined, were found to have their origin in one well-developed prothallus. With a penknife it was possible to divide the prothallus, so as to secure

the two plants, which were planted in a pan, and have not since been disturbed.

Prothalli were then planted from a pan of mixed muricate and undulate *Scolopendrium*s, and these were divided before the formation of fronds into two equal parts; in some examples the two plants resulting were alike, in others they differed, but showed their muricate and undulate origin.

The next experiment was to divide the prothallus into four equal parts. This was done in January, 1888. Every division grew, and spread in a more bush-like manner than is the case with the undivided prothalli, but up to July, 1890, there was no sign of any frond. It appeared evident that the male and female organs of generation were on separate divisions. To test this, in May, 1890, another prothallus was planted in close proximity to one of these; in fact, made to actually intermingle, and in August fronds appeared. The other divisions, except four, were similarly treated, and all have now produced fronds, except the four examples mentioned. The spores had been sown in August, 1887, and divided on January 12, 1888, so that the prothallus before you has been in this condition four years, the usual time from prothallus to frond being only a few months.

In an interesting example of the Lady Fern, previously alluded to, a prothallus produced three plants exactly alike; it was from a mixture of eight varieties, and these show the parentage of six, and now and then seven. They have the lax pinnae of *uncum*, the cruciate pinnae of *Victoria*, the lunulate pinnae of *Frizellæ*, the truncate terminals of *truncatum*, the cruciate pinnules of *crucipinnulum*, the projected pinnae of *projectum*, and occasionally the crested of *multifidum*. This Fern (a frond of which is produced), has therefore reproduced six, and occasionally seven characters. Recollect, referring again to the doctrine of probability, that it is 720 to 1 against the production of six varieties on the same plant, and 5040 to 1 against seven.

Turning to other means of reproduction, experiments are required in order to ascertain why the bulbils that form on some fronds do not always produce plants like the parent, and why it is possible to transfer the bulb-bearing character to other varieties. *Scolopendrium densum* often produces much more coarse and less-divided Ferns than itself; *densum* and one of its coarse bulbils are before you.

The beautiful plumose Shield Fern, known as *plumoso-divisolum*, has produced two plants from its bulbils that are strikingly distinct from the parent and each other. One is densely imbricate, and procumbent, like the parent; whilst the other is as finely divided as *Todea superba*, and is erect in habit.

Again, aposporous plants (that is, those raised from the prothalli direct, without the intermediate spore) also vary, as will be seen from an aposporous plant of the clarissima variety of the Lady Fern.

Even plants raised from bits of the stipes of plumose *Scolopendrium*s have produced a marginal belt.

It is desirable to state that I have never seen any variation in the plants raised from bulb-bearing species, of which there are many foreign examples.

There are so many truths yet to learn with regard to Ferns, that it is desirable that some younger men should take up these inquiries. *E. J. Lowe, F.R.S., F.L.S., &c.* [The two preceding papers were read in Section D. of the late meeting of the British Association at Cardiff, and various illustrative specimens exhibited, as also at the last meeting of the Royal Horticultural Society. Ed.]

FRUIT FARMS.

MARKET PLUMS.—Mr. W. Warren, at Isleworth, has 90 acres of ground under fruit culture, and literally crowded with trees and under-growth, in the shape of bush fruits, Raspberries, and Strawberries. Of top fruits, Plums form the chief portion; indeed, so large is the number of trees grown, that, because there is a good crop this year, Mr. Warren roughly estimates it at about 200 tons; but then, at Isleworth, it will be the produce of thousands of trees, of all ages, varying from ten up to thirty years. Let it not, however, be hastily assumed that this enormous crop is of annual production. No greater mistake can be made by anyone than in supposing

that every year brings its abundance of Plums, or any other hardy fruits. He had a good crop in 1888, and he had then following a couple of barren years. Now we have a heavy crop again, so that were a fair estimate of Plum-tree productiveness to be taken from this fact, it will be found that the triennial crop has to make good the losses incidental to the two other barren years. Some growers will perhaps hold that it is of too roseate a character to say that Plums crop fully even so often as every three years; and it will be more generally accepted, that the fairest way to estimate the productiveness of any breadth of Plum trees, would be by casting the average over seven years, when at least two full crops may be looked for, the other seasons having either very thin crops, or none at all. Looked at in this light, the profit which may be expected to accrue from so enormous a crop of Plums as 200 tons this year, is largely discounted, for if—during

customers is, that the cost of marketing is trifling. At Isleworth, the Early Prolific does, as standards, so indifferently, that none are grown. That is a matter of surprise, when we see other Plums doing so well, and furnishes at once a striking comment upon the fallibility of lists of Plums compiled from one soil or district. Mr. Warren mentions that Early Prolific does best on gravel, and that seems to be the case, as within a few miles, on gravel it fruits very well.

The earliest Plum at Isleworth is the Czar; that is doing wonderfully well, a vast number of trees, some ten years planted, fruiting abundantly, the fruits were putting on colour freely the first week in August. The Czar Plum has a sturdy, clean, erect habit, the stout stems supporting the great weight of fruit carried remarkably well, and in striking contrast to the pendulous and somewhat brittle-wooded Victoria. Mr. Warren was eloquent over the

fruiting freely and putting on rich colour early; Josephine, a Scottish Apple, early and showing very fine colour, and a large quantity of young trees are being gradually employed for mending; Lord Grosvenor, which fruits very finely on the Isleworth ground.

Pears do only indifferently, some old small-fruited sorts of no great merit crop abundantly; but the better-class Pears will not crop well, hence are not much grown. Beneath the trees, Gooseberries—especially Lancashire Lad and May Queen—red Currants, and Raspberries are the chief fruits. When the bushes are done, because the top trees become too thick they are grubbed out, the ground cleaned and manured and then planted with Raspberries and Strawberries, especially of the Grove and Scarlet. After these are exhausted, the tall trees are pretty well too dense to admit of anything doing below. Much of the surplus fruit Mr. Warren boils down into pulp on the place, and thus utilises to the utmost that which other growers would have to waste. A. D.

HYPERICUM MOSERIANUM ×.

ONE of the most effective flower-beds in the Royal Gardens, Kew, this season has been constituted by a dwarf very free-flowering Hypericum, which continues to expand its flowers throughout the summer and autumn. A specimen of the same plant shown at the meeting of the Royal Horticultural Society, on August 25, of the present year, by Mr. Antony Waterer, met with such approval from the critics that they awarded it a First-class Certificate. When it is remembered that we have already *H. calycinum* and *H. patulum*, it will be understood that the award is in this case very significant, and a true expression of merit. *H. Moserianum* ×, is indeed a hybrid raised by M. Moser at Versailles, between the two species above-named, *H. calycinum* being the pollen-parent. M. André, who originally described the plant in the *Revue Horticole*, 1889, p. 463, says that it unites the characteristics of both parents, while it is superior to either—and we concur in his opinion. M. Moser, we learn, tried the reciprocal cross and obtained the same result, which is noteworthy.

ORCHID NOTES AND GLEANINGS.

CATTLEYA LABIATA, Lind.

It is a strange fact, that in recent times many long-forgotten, good, old plants have been re-introduced. For the last half-century innumerable varieties of *C. labiata* have filled every stove; but the true *C. labiata*—the original plant named after Mr. Cattley in 1821, has vanished. We have before us the original description and the original drawing, a masterpiece of Mr. Curtis', in Lindley's *Collectanea Botanica*, and we cite the description, as it is only to be found in one of the rarest and least accessible of books. It runs as follows: "Bulbi fasciculati, epigæi, oblongi subcogoni. Folia solitaria, lanceolata retusa plana cartilaginea, enervia, atroviridia, rubro-marginata. Spatha duplex, exterior maxima, foliorum fere longitudine, acinaciformis hinc fissæ colorata, interior multoties minor. Scapus 1—2 floribus, intra spatham inclusus teres glaber. Flores resupinati suavissime lilacini odorati. Perianthii patentis lacinia, 3 exteriores lanceolata acuminata, interiores patentæ ovato-lanceolata, margine crispæ exterioribus multoties latiores. Labellum obovatum cucullatum carnosum porrectum limbo margine eroso, undulato, intus pulcherrime lateo et rubro venosum versus apicem intense purpureum. . . . The description of the gynostemium is of no interest in this place."

Mr. Curtis's drawing shows us a very handsome flower, about 5 inches across, the sepals and petals more acute than in the varieties now cultivated. The general colour is a very rich rosy-purple, with a light bluish hue; the labellum very slightly serrulated with a deep blood-purple blotch at the top, and bordered

FIG. 38.—HYPERICUM MOSERIANUM ×: FLOWERS YELLOW, ANTHERS RED.

the barren seasons—there is little expenditure incurred in labour and marketing, there is rent, rates, cultivation, &c., to be met; besides that, interest on capital, which adds to the reduction of the average of profits; moreover, because this heavy crop is all crowded into one season, prices are at least 20 per cent. lower than would be the case were the produce spread over the whole of the years. This forms a serious deduction from the profits of fruit culture. It is not at all compensated for by the sale of large quantities of fruit to the jam-makers. Happily for our growers, the preserving trade has become a large one, as but for it we should see, in such a season as the present, enormous quantities of fruit left to spoil, because the public demand would be too small. Still, preservers buy at rates that, to the retail consumer of Plums, would seem to be wonderfully disproportioned to the amounts they have to pay for small quantities. The preservers take in bulk, and the chief advantage in having them as

merits of the Czar, and certainly the general appearance of the trees, and the fine aspect of the crop now carried, justify these eucommiums. The fruits are well in request also, because presenting welcome variety to the Victoria, which will presently literally flood the market. Rather a curious feature in relation to this latter Plum is shown at Isleworth. Trees from a nursery on good deep holding soil have, from the first, never cropped so abundantly as have trees from poorer soil in Surrey. The former have done well, almost too well; the latter have not made much good growth, but crop enormously. A seedling from Goliath Plum seems to be better favoured than is the parent, and produces good crops. So also do Gisborne, a capital hardy pale Plum; whilst Pershore is one that rarely fruits at all. Another poor fruiting sort is the Dove Branch, of which there are many old trees. Of other trees there are Julien Apples, the points dying back remarkably; Lord Suffield, Manx and Keswick Codlins; Greenup's Pippin

with white. The bulb is eight-edged, and the sheath double, the inner one much smaller than the outer. The bulbs, at the flowering time, are about four months old, and not fully matured. These two characteristics are peculiar to the species, and do not usually occur together in other *Cattleyas*. Dr. Kränzlin, Berlin.

THE GARDEN VARIETIES OF CLIVEIA MINIATA.

DR. LINDLEY was the first to use the word *Clivea* [or more correctly *Cliveia*] in relation to this genus, but the plant so named does not seem to bear any affinity to the garden varieties of *Imantophyllum* or *Cliveia*. A beautiful plant flowered for the first time in England in the gardens at Syon House in 1828, which was figured in the *Botanical Register*, tab. 1182, under the name of *Clivea nobilis*, and the Editor, Dr. Lindley, remarks:—"We have named this genus in compliment to Her Grace the Duchess of Northumberland, to whom we are greatly indebted for an opportunity of publishing it. Such a compliment has long been due to the noble family of Clive, and we are proud in having the honour of being the first to pay it." On the very same day, the same plant was figured in the *Botanical Magazine* under the name of *Imantophyllum Aitoni*. Later, Dean Herbert adopted the name of *Cliveia* in preference to that given to it by Dr. W. J. Hooker. *Imantophyllum miniatum* is altogether a different plant, and was introduced by Messrs. Backhouse, of York, from Natal, about the year 1853, the original plant being figured in the *Botanical Magazine*, tab. 4783. There is a supposed natural hybrid between this species and *C. nobilis*, which was figured in the *Flore des Serres* under the name of *I. cyrtanthiformum*, but the plant seems to favour most the original species of Lindley, *C. nobilis*.

These preliminary remarks may be useful as indicating the parentage of our garden varieties, and the origin of the names for the garden varieties pass indiscriminately as *Cliveia* and *Imantophyllum*; but the last-named word was first published without the "n." *Cliveia* seems to take precedence; it is the prettier name, and not so difficult to pronounce as the other. Dean Herbert, who carefully cultivated this class of plants, and gave particular attention to any new genus or species. He found *C. nobilis* required no particular care to cultivate it; it was merely sheltered from frost, and flowered freely in the greenhouse if placed near a front light. The berries, he stated, took a year to ripen, and the seeds were often found to have vegetated within the pericarp. Looking through the houses of Messrs. John Laing & Sons, at Forest Hill, the other day, I found the *Cliveias* well grown, and numerous very fine varieties are annually raised from seeds in the nursery. Mr. John Laing, the senior member of the firm, takes a particular interest in these plants; he truly remarked that the handsome deep green foliage was very beautiful in itself, and when the plants were not in flower they would most likely be furnished with clusters of scarlet berries about the size of Gooseberries—they are oval in shape, of a dark red colour, and very effective in winter. Their value as flowering plants is so well known, that there is no need to say anything about them. The seeds when ripe vegetate very freely, and the plants produce their flowers after two years' growth. We have found, as Dean Herbert also ascertained sixty years ago, that they do not need a very high temperature. That which gardeners know as an intermediate-house is best in winter, but they are quite at home in the greenhouse in the summer months. It is easy enough to raise plants from seeds, but the old *C. miniata* is no use now. Mr. Laing has turned it out of the house where his choice seedlings are grown, and those who expect to raise seedlings that would compete with the best of the present day, must obtain good varieties to start with. When the seedlings are obtained, they must neither be forced on in a high temperature, nor potted on into over-large pots. A good strong flowering plant can be produced in a 6 inch pot, either as seedlings, or

propagated as offsets from the named varieties. Good yellow loam, with a little fibrous brown peat added, some decayed stable manure and coarse white sand, will grow them well. They soon grow up into large specimens.

I fancy the first start Mr. Laing made in seedling raising was from a variety of continental origin, and was named Mrs. Laing; it was much admired when first exhibited, the flowers being of large size, good form and colour, and the trusses very large. *Sulphurea* is a distinct variety of a very pale yellow colour; *Orange Perfection* has well-formed orange-red flowers, distinct and handsome; *Meteor* is the richest coloured of any of them. All the above are obtainable at a moderate price now in the trade. One of the most recent and best acquisitions obtained by the firm has been named John Laing: it is of a rich orange-red colour, and has produced twenty-two flowers on one cluster. *Lady Wolverton* is also a decided advance. The flowers are of large size, and the corolla reflexes.

There is a wide field for the hybridists in this genus of plants. Not more has been done than to breed in and in from the specific form, or a variety of it with broader foliage, named *robusta*.

The *Cliveia nobilis* is altogether a distinct thing, and would make quite a new break if crossed with Mr. Laing's best seedlings. *C. Gardeni*, a species discovered in the Natal Colony about the same time as *C. miniata* was introduced, is distinct from *C. nobilis*, and might be even more useful to hybridize with, as the flowers are as large again as those of *C. nobilis*; but it is more nearly allied to that species than to *C. miniata*. They are interesting bulbous plants, and require that some one should make a specialty of them, and bring out their beauties to the best advantage. *J. Douglas*.

ROSERY.

ROSE SHOWING.

THE crumpled Rose leaf that is said to have disturbed the repose of the Roman Emperor has at last appeared on the hitherto soft and pliant couch of the National Rose Society, a Society which has been singularly free from those disturbing elements which so many societies of all sorts and descriptions have to experience at one time or other. There was a slight rippling of the surface when the Society had to define what an amateur was, and when the questions of "gumming Roses," or too-much-alike Roses, were mooted; but owing to the manner in which these were met, and the general good feeling that prevailed, the calm soon came, and no rumbling of the storm survived. This makes one hopeful that the present disturbance will be met in a like spirit, and end in a like manner.

The question which is now before the Rose-exhibiting world is connected with the "grievances of small growers," and it is one of the consequences of a state of things which, I fear, has deteriorated the character of Rose exhibiting, much in the same way as the visit of the Australian cricketers, notwithstanding the fillip it gave to that noble game, had a bad effect in making captains of teams look more for the gate-money than had previously been the case. So I think what is called vulgarly pothunting, in which the great object is the amount of money to be gained, more than any honour that may accrue, leads large growers to pop down into smaller classes, and so swamp the small men. These we are frequently told are the backbone of the Society, a dictum from which I beg to dissent. If you were to take away the exhibits of such men as Messrs. Baker, Budd, Lindsell, Pemberton, Hill, Gray, and Burnside, I wonder how many small growers it would take to make up their loss. I am glad to see small growers, and to see their exhibits multiplied, but they are not, in my opinion, the backbone of the Society, and I find, as a matter of fact, there is more growling amongst them than among the large growers, not only on this, but on many other points.

Well, granted that it is a grievance, that it is very "annoying" when a small grower thinks he has a fair chance, for a giant to come down upon him, and snatch the coveted prize away. My opinion on this point is very decided, *i.e.*, that if an exhibitor cannot show in the classes he has usually done, whether from lateness, or earliness, or any other cause, he had better not show at all. But this is one of those things with which in all cases it is difficult to cope. The great institution of Christ's Hospital was established for the purpose of educating the children of poor and struggling people. We know how it has been abused, and so it runs all through; and as a person may not have the good feeling to consider (and act upon it) that when he is perfectly able to educate his child, if he accepts a nomination to Christ's, he is filling the place of some one who really needs it; so I am afraid there will be cases in which some large growers will absorb what ought to belong to other people.

The National Rose Society has endeavoured to meet these small growers. The schedule is so framed that growers must confine themselves to one division, and cannot pick and choose in what classes they will exhibit; nor can they, when they come to the show, alter it if they find that they are not up to their usual form. Moreover, it has instituted small classes for those who have never won a prize at the Society's shows, and also for suburban growers; and now in this matter it is required to come forward with some sort of grandmotherly legislation to protect the infants from the bad manners of the naughty big boys.

There have been two schemes put forward for the purpose of meeting this difficulty, one by Mr. C. J. Grahame, of Croydon, and the other by the Rev. J. H. Pemberton, of Ilavinger. In examining these, and in pronouncing against them, as I must do, I hope it will be borne in mind that I am not an exhibitor, and can, therefore, perhaps, like the onlooker of a game of chess, take a cooler and more dispassionate view of the merits and demerits of the case. Let us examine Mr. Grahame's proposed revolutionary schedule first. My main objection to it is one of principle. I think, that as it is arranged on the plan of placing an amateur according to the number of the plants he grows, it would lead to a system of espionage and suspicion that would be most hurtful, for who is to count the plants the grower has? Is he himself? and if so, what plants? Mr. Grahame's scheme is confined to the Roses mentioned in the National Rose Society's Catalogue of Exhibition varieties. He cannot, I presume, grow anything else. He cannot grow *Glory of Waltham*, or *Glory of Cheshunt*, *Madame Clemence Joigneaux*, or *Mrs. Harry Turner*, for suppose an enumerator were to come round and take his census, it would be of no use him saying, "I do not exhibit from these." There they are, and they must be counted. And then, what about the weakly ones which the grower hopes to bring round, but from which he does not expect a flower this season? "Oh, no! that is my hospital." "But invalids are enumerated in the census, and so I suppose must these be." "And is this *Gloire de Dijon* to be counted? it is not an exhibition Rose." "That may be, but still it is a Rose," and so on. In fact it seems to me that the plan is utterly unworkable. I have another very strong objection to Mr. Grahame's plan, and that is that it does not touch the state of small growers at all: his lowest class is for amateurs who may grow 1000 Perpetuals and Teas. To my mind that man is anything but a small grower; this I do know, that one amateur, at least, who does not grow beyond this number, exhibits and comes off safer in the class above that to which Mr. Grahame assigns him. No, it is the man who grows 500 Roses or under who is really the small grower, and although I think it quite possible that so small a grower might hold his own against those who grow a much larger number, and indeed have seen instances of it, yet I should be prepared to see a division especially set apart for such men, leaving the other classes untouched, and trusting to the honour of exhibitors to confine themselves to classes in which they are justly entitled to exhibit; and I

think when once an exhibitor has taken his place in a division he ought never to exhibit in a lower one, although the circumstances of the season may be against him. Of course, it is open to him to get into a higher one, as, indeed, ought to be the object of his ambition. I think the cogeny of this will be better seen by looking at the nurserymen's classes. What would be said if the great nurserymen, because the season was unfavourable to them, dropped down into the classes for smaller nurserymen? and the same feeling ought to be experienced when one sees amateurs adopting a similar course.

Mr. Pemberton's plan of regulating the classes not by the number of plants grown, but the character and account of the labour employed is, I think, equally objectionable; it has certainly the merit of not being novel, as it is adopted in many provincial horticultural cut-Rose societies, but is confessedly difficult to work. I have seen the breakups and disputes to which it leads, as to whether the man employed was to be considered a professional gardener or not, a point in which the employer may hold a different opinion to that of outsiders. I rather fancy that the commissioners of assessed taxes could give a little valuable information as to the difficulty of obtaining accurate information on such a subject and I think the same objection that I have to Mr. Grahame's plan applies to this, that it would introduce a system of espionage and suspicion, and go far to mar the good feeling that has hitherto existed amongst the members of the National Rose Society.

And, after all, I wonder how many exhibitors feel themselves aggrieved? There are a number of people who are ready to take up a question of this kind, but that is not the point as to how many small growers feel that they are swamped by the bigger ones. Of course, one always hears on a question of this kind, "Oh, everybody speaks about it, and, unless it is altered, the society will suffer loss." I was always doubtful of these assertions, and am confirmed in my scepticism by recent experience.

The question as to altering the date of the Metropolitan Show because the first Saturday in July comes on the second of the month, was lately mooted, and is still *sub judice*. It was distinctly stated that an overwhelming majority of exhibitors were in favour of postponing the show to the 9th. In order to ascertain whether this was the case, a circular was sent to all exhibitors south of the Trent (as it was a matter in which only southern exhibitors were really concerned), and the result of the poll has been that there is a very small majority in its favour, and probably not a few of these answered under the influence of the present exceptionally late season.

I hope, therefore, that this matter will meet with careful consideration, and that the position will be well considered before any change is attempted. I believe that whatever decision the society may come to, will be loyally accepted by all its members, and the good feeling and harmony existing hitherto be preserved.

There is another matter connected with Rose showing I should like to touch upon, the "too-much-alike Roses," but this I must reserve for another occasion. *Wild Rose*.

BRIAR STOCKS FOR STANDARD ROSES.

All Rose growers who propagate standard Roses largely, are found mourning over the losses in the Rose stocks they purchased and planted up in the autumn. Some are found stating they have lost fifty per cent. of their stocks, others less, and it is supposed to be traceable to the severity of the past winter. But if the intense cold would kill twenty, thirty, or fifty out of a hundred—why not all? I am not disposed to attribute these losses so much to cold and frost, as to dryness at the roots. Stocks or standard Roses are those of the Dog-Rose dug from the hedgerows. In the deep loam of the hedge, fertilized by vegetable mould, the strong stools of the Dog-Rose throw out from around them numerous vigorous suckers. These are cut off with a thick knob forming the root, but often with scarcely a fibre attaching to them. They are tied up in bundles and

carted to the nurseryman, and by the time they reach him, from exposure and other causes, what little remains of fibrous roots has become nearly or quite dried up. They are generally laid in roughly by the heels, until a convenient time for planting them out permanently in nursery quarters; and when this is accomplished, it is at a season of the year when the stocks get perhaps the smallest help from Nature in the way of assisting them to root. Now, as the ground was unusually dry last autumn and winter, it is reasonable to suppose there was not sufficient moisture in the soil to induce the putting forth of fibrous roots, consequently many perished, while those who possessed enough of these root fibres to act as feeders, managed to exist.

I was speaking some time ago to a nurseryman, who is a considerable grower of Roses in the West of England, and he informed me that a few years ago he ordered a large number of Rose stocks for standards, and to his surprise a quantity was delivered early in September when the weather was hot and dry, and when his staff was too busy about other matters to be able to plant them. As they appeared to have suffered from the drought, he at first hesitated to take them, but afterwards agreed to do so at one-half the price usually paid, the remaining half to be paid in the event of the stocks growing—an eventuality he thought hardly probable. He gave orders for the stocks to be placed in a pond of water until they could be dealt with, and there they remained for several days. In due course they were planted, and scarcely a failure occurred, and the original price was paid for them. The conclusion this nurseryman came to was, that by thoroughly soaking the root-stocks in water, they were helped to put forth fibres; or, at any rate, they imbibed enough moisture to carry them along until such times as they put forth roots.

I think, therefore, dryness of the soil is a very probable cause for failure with Briars during the past winter. I was astonished on several occasions to see, after the frost broke up, how very dry the earth was a foot or so below the surface. It seemed inconceivable, after so wet a summer as that of 1890; but we had a warm, dry autumn, and the dryness continued almost up to the time when severe winter set in, and put a stop to outdoor operations for a considerable period. *R. D.*

BASS, OR PIASSAVA.

ABOUT forty years ago, a great deal of interest was excited about a new product that was then becoming generally used for road brooms and brushes. It was a stiff dark-brown material, and for some time was generally supposed to be split whale-bone. The truth, however, soon came out that it was of vegetable origin, and finally that it was the stiff fibre from the sheathing bases of a Palm, that it was known as piassaba, piassava, or bass, and that it came from Brazil. A very great demand sprang up for it, and it was soon discovered to be produced by two Palms, *Attalea funifera* in Bahia, and *Leopoldinia piassaba* in Para. The introduction of this bass or piassava is due to the perseverance of Mr. Arthur Robottom, who has lived to see the material become an article of the greatest importance in British trade, so great, indeed, that the demand has of late years exceeded the supply, and the price has consequently been advancing. To meet this demand, other articles of a similar character have been brought into the market as substitutes, but none have proved equal to the original bass, not even when, a few years ago, a true piassava of a closely similar nature, but much finer and not so elastic, was introduced from Madagascar. This has since been proved to be the produce of an undescribed species of *Dictyosperma*. The most valuable substitute, however, and one that promises to become a formidable rival, is that which now appears in the trade circulars as African piassava, and is furnished by *Raphia vinifera*, which is known in Lagos as the "Bamboo Palm." A full account of this new article of commerce was published in the

Kew Bulletin for January last, where, in some notes on this subject by the Governor of Lagos, it is stated that "the Bamboo Palm or *R. vinifera*, is, perhaps, the commonest tree in the swamps and lowlands which line the waterways of the colony. Dense thickets of these Palms, traversed only by the Palm-wine-gatherer or the Bamboo-cutter, push their way into the lagoons and extend over the flood-grounds, and even to a distance of from 15 to 20 miles up the river valleys into the interior. The area occupied by these *Raphia* forests it would be impossible to calculate, but it may be accepted without doubt that they extend throughout the length of the colony, and to a distance of at least 15 miles from the sea coast, and that over this area of about 5000 square miles they form a considerable portion of the vegetation."

The bass consists of the stiff and wiry fibres extracted from the petioles or leaf-stalks of the Palm, and is of a dark brown or chocolate-brown colour. It can be readily obtained in lengths of from 3 to 4 feet, and its supply in Lagos alone is said to be practically inexhaustible. So rapidly has this new bass fibre taken hold of the English market, that in recent quotations it has commanded prices equalling, and even exceeding those of Para and Bahia. The development of these new sources of a most useful and necessary article of commerce, illustrate in a marked degree that the vegetable kingdom is far from being exhausted in her supplies of new products. To those acquainted with market reports, who have so long been accustomed to see under the head of Piassava, quotations only of the Bahia and Para sorts, it does seem strange now to see Madagascar and African regularly added. But there is no reason why the supplies should stop here; there are plenty of other Palms in the tropical parts of the world which, upon examination, might yield similar products. *John R. Jackson, Museum, Kew.*

FRANÇOIS LEGUAT'S PLANTS.

(Concluded from p. 159.)

MAURITIUS.

DURING Leguat's residence in Mauritius, although it lasted three years, he had not so much leisure to study the plants of the larger island as he had enjoyed in his more remote home at Rodriguez. The parts of the island which he visited were first, the various estuaries and bays along the south coast as far as the Ile Furneaux—so named, it may be supposed subsequently after Captain Furneaux—thence round the point of the Morne, where Lacaille afterwards measured a base line, and so to Black River. At Black River the adventurers remained a month, until they proceeded by boat to Port Louis, and thence by land across the northern part of the island to Flacq, where the Dutch Company had their farm and plantations, which supplied the garrison and Dutch ships with fresh provisions. The passage to South-east Port, where the Dutch Governor resided, was accomplished by boat within the reef from Grand River, South-east. At Fort Frederick Hendrik, Leguat remained nearly six months, until he and his comrades were transferred as prisoners to the Vaques Islet, the centre one of the three islets, between Isle de la Passe and Fouquet I. (where the lighthouse now stands), then called the Three Brothers. After an imprisonment of two years on this desolate rock, the survivors were again brought to Fort Frederick Hendrik, but kept in confinement until they left the island; and thus Leguat does not give any detailed description of the Mascarene flora—with one notable exception, which has caused some confusion in its identification. Unfortunately he has not attempted to give any illustration of it, although perhaps it might not have made us any the wiser. It is possible that the notice given of this plant in the *Gardeners' Chronicle* may lead to some additional light being thrown on the real plant which Leguat noticed. His account of this "Strom-boom," or Stink-tree, is as follows:—

"Il y a une espèce d'arbuste qu'ils appellent Stront-boom, ou Arbre du M-rde, qui est extrêmement venimeux. Le milieu de son tronc est plus gros que ni le haut, ni le bas. Le bois est molasse; & la feuille ressembleroit beaucoup à celle de nos Saules, si elle n'étoit pas un peu plus large. Je n'y ai vu ni fleurs ni fruits. Le bois & l'écorce sont un poison prompt & violent, & à ce qu'on m'a dit est sans remède. Un jour, comme je passois dans les bois, au retour de la chasse, j'en rompis par hasard une petite branche, & j'en portai sans reflexion, & sans avoir jamais ouï parler de cet arbre, un petit éclat à ma bouche. Je le rejetai incontinent, sans rien avaller, & cependant j'en pensai mourir. Pendant 24 heures, il me sembloit que quelqu'un me serroit la gorge, & je l'avois si enflée qu'à peine pouvois-je respirer. Dans les pays qu'on ne connoit pas il faut être d'une grande circonspection sur ces sortes de choses. On m'assuré que la manière ordinaire, dans ces Isles, de discerner les fruits venimeux d'avec ceux qui ne le sont pas, c'est de les présenter à quelque siége de l'Isle même; parce qu'on peut à coup sûr manger de ce qu'il mange, comme on doit aussi laisser ce qu'il persiste à refuser."

Leguat's account as to the poisonous qualities of some plant in Mauritius is confirmed by the well-known author of *Paul and Virginia*, M. Bernardin de St. Pierre, who nearly eighty years subsequently, writing from "The Port," October 8, 1768, states:—"Some days ago I perceived a large tree in the middle of some rocks, and, being desirous of cutting a piece with my knife, was surprised at the whole blade entering without my using the least force. It was of a substance like a Turnip, and of a very disagreeable taste; for some hours after (although I did not swallow any part of it) my throat was much inflamed, and felt as if pricked with pins. This tree is called Mapon, and is looked upon as poisonous." Baron Grant also mentions this tree in similar terms, having derived his information probably from M. de Saint Pierre.* Mr. Baker says:—"Mapon, in Mauritius, is *Vitis Mappia*, a harmless Vine. Boia mapon, more than one species of *Pisonia*, also harmless purgative perhaps, but not actively poisonous." He adds, "I should think the poisonous tree would most likely be a *Stillingia* (*Euphorbiaceæ*) or something of that kind. . . . There is a *Stillingia anguina* in Mauritius, which I infer from the name is poisonous. Those sorts of plants have an acrid milky juice, and the Seychelles ally is superstitiously dreaded by the natives, and called Bois Jasmin."

The Mapou tree of the Plaine des Caffres in the neighbouring island of Bourbon is mentioned by Maillard, and stated to be *Monimia rotundifolia*. "This *Monimia rotundifolia* of Mauritius, in the herbarium at Kew is labelled," says Mr. Scott Elliott, "Bois de Tierle."

Professor Balfour writes with regard to *Monimia*:—"It may be worth noting what may, however, be merely a coincidence—the allied genus *Tambourina* has a species Bois Tambour (there is the translator's T. tree?), and some species of *Tambourina* have been called *Mithridateæ*, and this genus was founded by Commerson, the father of so many Mascarene genera, and taken up by Schreber. I do not find any poisonous qualities now attributed to the *Monimiaceæ*; but if the tree had not some reputation in connection with poison—antidotal, or itself venomous—why should Commerson give it such a name? At least it should be a medicine-yielding tree. Unless some evidence from the nomenclature takes one to *Stillingia*, I should prefer to trust to the clue which such evidence affords, and seek for the plant either among the *Vitaceæ* or *Monimiaceæ*. . . . I cannot conjecture what it (the Stront-boom) might be. It would be strange if the name of so conspicuous a tree as the Mapon must have been in Leguat's time, was transferred to another tree, without its properties, even if the original Mapon were exterminated."

Colonel Pike, whose work on Mauritius is well

known, relates that when wandering in the woods of Mauritius, in 1867, his guide was constantly calling attention to different plants medicinally used by the Creoles. "He showed me one that he said would produce death in a short space of time after the juice had been taken into the system. I did not know its name, but found it was a species of *Euphorbia*. He said, if a branch was bruised, and thrown into a pond, it would destroy the fish. He especially pointed out one that would cure a person that was addicted to the use of ardent spirits (pity it is not generally known), with many other wonderful things, to all of which we listened with becoming attention."

Leguat is the only authority who has described the Géan, or Giant Bird, which, according to his account, was a struthious bird, some 6 French feet high, with long legs and neck, with short wings, and which the Dutchmen ran down with dogs.

Leguat's editor figures this bird—but the figure has been taken from an ancient engraving of some Indian bird, also unidentified, drawn by the artist, Collaert, a hundred years before.

Here it is out of place to discuss the veracity of Leguat's ornithological descriptions, which have been dealt with by Professor Newton of Cambridge, Milne-Edwards, and other authorities; but the plate may be noticed, because it is possible that the remarkable tree behind the bird may have been intended by the artist to represent the Strontboom with Willow-leaves, as the branches are indicated drooping, so as to suggest a weeping Willow. Should this republication of Leguat's notice of the Strontboom meet the eyes of anyone at the Botanical Gardens of Pamplemousses, in Mauritius, it may serve to reawaken some interest in the subject, and lead to its identification.

During the greater part of 1697, Leguat was either a prisoner or serving as a soldier at Batavia, and of the Javan flora, like the Mauritian, he does not say much that is remarkable; he says:—"This island (Java), moreover, as you may very well imagine, has its own particular plants. Here follow two of them, which one of my friends who has apply'd himself to that study has curiously design'd for me: I think they are little known; they say they only grow naturally in some of those little islands which lie between Borneo and Java."

The two illustrations represent certainly two very extraordinary plants, one has a faint resemblance to the illustration given by De Rochefort, as the Yam, Topinambore, or Batate. Whilst at Java, Leguat mentions the poisonous sap of a tree which grows in the island of Borneo. "The inhabitants of that island," he says, "make use of it to poison their little darts which they shoot out of sabercanes" (*i.e.*, blow-tubes). Major Thorne, who was on the staff of the English army which captured Java, on the other hand, mentions an antidote. He writes, "A sap, extracted from the juicy leaves of the Magas or Kiati tree, is held in high estimation as an effectual cure of wounds made by crises and spears that have been dipped in a poison composed of the blood of the Gekko, and other ingredients." Dr. Charles Pickering, in his *Chronological History of Plants*, states this poison-tree to be the "*Antiaris toxicaria* of the Siamese countries and Malayan Archipelago. The Bohun Upas is a large forest tree, sometimes called 'antsjar,' and the knowledge of its exudation seems implied in the prohibition against poisoned arrows in the Institutes of Manu. Claspings the poison-tree is mentioned by Bhavabbhuti. *Antiaris toxicaria* is known to grow as far as N. lat. 19° in the neighbouring portion of Burmah, and its exudation continues to be used by the Karcus to poison arrows. Further south, a tree in the Malayan Archipelago, according to Jordanus (Col. Yule's edit. Hakluyt Society, vol. xxxi.), is said, when in flower to kill every man that cometh near it; an account not strictly true, but *A. toxicaria* has been shown by *Rumphius*, ii., pl. 87, L. de la Tour and Blume, to be virulently poisonous; it is known to grow particularly in Java, Baly, and Celebes." The *Strychnos tierite*, also of Java, a climber, 120 feet, or *Upas radja*, is another poisonous

plant, whose root yields one of the most dangerous poisons known, acting like *Nux vomica*. As a background to Leguat's figure of the hooded snake, his artist has inserted an exact copy, reversed, of De Rochefort's Goyavier; and in rear of his drawing of an ourang-outang ape, an American *Opuntia* is depicted.

We may now examine the remaining plates in Leguat's book, and it will be found that in the illustration of the rhinoceros, the draughtsman has inserted an Acajou from De Rochefort's volume; again, behind the Hottentot man in full summer undress, he has planted a "Banane, Figuier ou Pommier de Paradis," also after Rochefort; and beside the Hottentot woman, without her petticoat, a Papayer from the same source. All these identifications which, as far as I know, have never before been pointed out, go far to prove that the majority of Leguat's illustrations are not original, but derived from some previous source. It is evident that we cannot trust to the drawing of the Giant bird of Mauritius, or to the caricature intended to represent the famous Solitaire of Rodriguez.

Undoubtedly the Solitaire did exist, as his skeleton has been found, and an almost perfect restoration effected by Professor Newton and his brother Sir Edward Newton, which may be seen in the Museum of Zoology at Cambridge; but the skeleton shows a bird which could hardly be represented by the misshapen caricature of it given by Leguat, and reproduced in a more finished style by Buffon in his *Ornithologie*. S. P. Oliver.

SIR TREVOR LAWRENCE'S COLLECTION.

SIR TREVOR is such a keen gardener, that any visitor to his pretty homestead at the foot of Boxhill, naturally expects a great deal. Unlike the generality of cases, the realisation exceeds the anticipation; for it is not only in the matter of Orchids that there is room for comment, but in nearly every other class of plants. In the lovely grounds, which have for background the abrupt woody slope of the hill, there is, to my vagabondish view, one eyesore—on either side of the main approach is an avenue of stiff sentinel-like *Cupressus erecta viridis*. When one is delighting one's soul with the natural loveliness of the background, these stiff formal things keep obtruding themselves into view. The bedding is almost entirely confined to Begonias, and very pretty the various shades of pink, scarlet, and yellow were. The herbaceous beds in the garden are also somewhat original; there is not a medley of plants, but plots of the various species. The effect is charming, and the contrast of large quantities of the red and white *Spiræa*, the blue *Platycodon* and *Echinopsis*, the yellow *Chrysanthemum maximum*, a white *Larkspur*, and the gossamer-like *Gypsophila paniculata* were very striking. In the borders in front of the houses some planted-out *Crinums*, chiefly Moorei and Powellii, were flowering most luxuriantly; they are left out all the year, being simply protected by a mulching in the winter. A rather uncommon plant in the herbaceous quarter was the *Cerunthe*; three varieties of this curious *Boragewort* are grown.

The greenhouses were very bright. There is an extensive collection of the new continental Begonias, and a large number of seedlings bearing flowers of great substance. Flowering basket plants were extremely well cultivated, one of the prettiest being *Lotus peliorhynchus*. Besides the *Vallotas* and *Pancratiums*, other noticeable plants in flower were *Chianthus Dampieri*, *Alstroemeria pelegrina alba*, *Tweedia oxypetala*, *Exacum macranthum*, *Costus igneus*, and the striking new *Streptocarpus* hybrids. The stoves contain most of the rare, curious, and beautiful tropical plants that are at all amenable to culture. The collection of *Anthuriums* is well known, many new varieties such as *Burfordiense* × have been raised here, and the present batch of seedlings show great promise. *Bertolonias* and *Sonerilas* are extensively grown, and very curious

* The botanist, Aublet, is also represented by a contemporary anonymous traveller as having nearly poisoned himself during his botanical rambles in the forests of Mauritius.

to study were the various Tillandsias, *Ataccia cristata*, and *Cochlostema Jacobianum*. The lattice-leaved plant from Madagascar, *Ouvrandra fenestralis*, is most successfully cultivated, and it is quite a source of wonder to the many visitors. A distinct Fern, *Aglaomorpha Meyeniana*, the Bear's-paw Fern, also causes great curiosity. The fronds are dimorphous, the fertile and sterile segments being totally unlike in form; only one species has been found hitherto, and that in Luzon.

The Orchids are so well-known to your readers, and so many have seen some of the finest at the Temple shows, that long comment would be superfluous. The *Cypripediums* in flower in August were *Stonei*, *calurum*, *orphanum*, *Godefroyæ*, *Harrisianum*, *superbum*, *Schroederi*, *javanicum*, *cardinale*, *Morganii Burfordiense*. Many of the *Masdevallias* were in flower also, very interesting were the hybrids *Hinksiana* and *Reichenbachiana*. The plants of *Grammatophyllum speciosum*, *Renanthera coccinea*, and *Vanda Sanderiana* are among the largest in the kingdom. The brightest house, however, at the time of my visit was the *Sobralia*-house, the centre stage was entirely devoted to them, and the beautiful delicate crisping and creamy flowers were produced in the greatest profusion. There was also in flower the finest variety of *Cattleya aurea* I had ever seen; the gold-lacing was much deeper than usual. A number of plants of the brilliant scarlet *Hubenia militaris* livened up a stage wonderfully. *Vagabond*.

NURSERY NOTES.

ORCHIDS AT ST. ALBANS.

WHEN visiting the great Orchid-growing nursery of Messrs. F. Sander & Co., as range after range of vigorous healthy specimens, many of them reputedly difficult to manage, are passed, the visitor naturally enquires what has become of the unhealthy specimens or invalids? for the eye fails to detect one in the whole of the seemingly endless labyrinth of Orchid houses. The answer is, that the unmanageability of any species of Orchid is not believed in at St. Albans, as long experience has proved to Mr. Sander and his clever manager, Mr. Godsell, that they have only to construct quarters according to the light of that experience, and from hints afforded by the collectors as to the conditions under which the plants grow in their native countries, and the most difficult plant becomes grateful and amenable to cultivation, and requiring but little pains to grow and flower it well. A few of the conquered ones may be noted in *Phajus tuberosus*, *Dendrobium Dearei*, *Oncidium ampliatum majus*, and the fine new *Grammatophyllum Measuresianum*, all of which, together with other difficult plants, as they are called, are growing in quantity in the warm house prepared for them, and which has a tank extending from end to end in which the red and blue Water Lilies were, at the time of my visit, beautifully in bloom. The Orchids are suspended over the tank, and have been ever since their arrival in this country, and yet even the most critical observer cannot detect an unsightly or sickly plant. So also in the quarters prepared for the handsome *Oncidium splendidum*, *Odontoglossum citrosimum*, and various other rare species which are grown by the hundred, and especially with *Phajus Humblotii*, which is only now declaring its full beauty, the scores of spikes on the batch at St. Albans, exhibiting it as white, or pink, or rose, or purple, of various shades, but always beautiful. With a view to carrying out this idea of building special houses for special plants, extensive as the establishment was before, Mr. Sanders is now just finishing another suite of ten very cleverly-constructed houses, their ends abutting on the large *Cattleya*-house, and which are intended chiefly for some expected new arrivals, from a quarter of the globe not stated. In these new houses are some novel features, worthy of a visit to see. One of the features is a system of water supply communicating throughout the whole

block. The ventilation and staging arrangements are also good, and embody some new ideas.

THE ROCKERIES,

which are here so well constructed, and planted with so much skill and venture, as regards the Orchids planted in them, contain many new plants of the foliage or climbing plant classes, sent over by the collectors with the Orchids, and some of which will doubtless become standard plants in our Stove-houses. Among plants of this kind, some of which are in pots, we noted a new and beautifully-marked *Philodendron*, some pretty new *Marantas*, a new variegated form of *Dracena fragans*, the elegant *Phoenix Roebelenii*, and the equally graceful and still rarer *Cocos Pynaertii*.

As regards the Orchids planted in the rockeries, it is stated that no failures have to be recorded, although some species do far better than others. In the cool rockery, *Cypripedium caudatum* is one of the most satisfactory, its leaves growing quite twice the size of those of pot-plants, and their long riband-like petals appearing to the greatest advantage, as they hang clear of the rocks. *Alsiophila ferox* clad with *Zygopetalum Gautierii*, and *Lomaria Boryana* with *Zygopetalum graminifolium*, also form pretty objects, the Orchids thriving better than usual by reason of their being still left on the native Tree Ferns on which they were found by the collector.

FOR THE GENERAL COLLECTION,

suffice it to take a hasty glance at the more prominent objects, containing specimens in flower. Of these, the greatest show is in the *Cattleya*-houses, where the various forms of the *labiata* section have many in bloom, such as *C. gigas*, *C. Mendeli*, and *C. Gaskelliana*, of which there are some very handsome and curious forms. One is the counterpart of *Cattleya Mossie Keineckiana*, another has flowers like those of *C. Wagneri*, and a third could scarcely be distinguished from a fine form of *C. labiata Warnerii*. *C. Gaskelliana* contains more bad varieties than any other species, but the good ones are equal to any form of *C. labiata*, and the redeeming feature of even the colourless or poor varieties is, that they are delightfully sweet. A fine show of *Cattleya Schofieldiana* and also of the ordinary form of *C. grandulosa*, also appears now in bloom; and a fine lot of *Odontoglossum Phalenopsis*, *O. Rozeilii*, and scores of great masses of the white *Lælia anceps Sanderiana*, *L. a. Stella*, *L. a. alba*, and other marked forms are marvels of good culture. In the large *Cattleya*-house also are plants of a very interesting cross between *Epidendrum ciliare* and *Lælia anceps*, which are approaching maturity, and are watched with a like interest to that bestowed on the curious crosses between *Bollea celestis* and *Zygopetalum*, and other strange hybrids in the quarters set apart for them. Among the *Aerides*, those two superb things, *A. Lawrenceæ* and *Sanderiana* are in bloom in many examples. The main difference between the two is, that the flowers of the former has a white ground, and the latter a yellow. Among the fine display of *A. Sanderiana*, there is a new *Aerides* in the way of *Sanderiana* in flower, and which may be regarded as the largest and most beautiful of known species of *Aerides*. It is a very stout grower, and sends out long sprays of flowers, even larger than those of *A. Lawrenceæ*. The colour is clear yellow and rich purplish-crimson, a quaint crescent-shaped blotch of the latter tint appearing at the tip of each segment, and a bright tinting of it on the spur and labellum, which is broader and more open than in the other species. To crown all, the noble variety is delightfully fragrant. The cool-houses, with their thousands of *Odontoglossum crispum*, *O. Pescatorei*, *O. blandum*, and indeed all the good species still continue in grand health, and give their quota of flowers. The house of spotless specimens of *Miltonia vexillaria*, also has some in bloom. The *Phalenopsis*, which do well at St. Albans, have many *P. Sanderiana* and some of the lesser species in flower; and among other good things noted, were a specimen of *Calanthe vera trifolia*, with fifteen spikes; *C. Masuca*, *C. Domin-*

iana, *Oncidium hæmatochilum*, *Aeranthus grandiflorus*, the new *Dendrobium dicuphum*, *D. Phalenopsis*, and other *Dendrobiums* from the Torrea Straits region; a batch of white *Lycaete Skinnerii*, *Cattleya velutina*, *C. Eldorado Wallisii*, *Epidendrum Wallisii*, *Sobralia xantholeuca*, *Lælia elegans Turnerii* varieties, *Cycnoches chlorochilon*, *Cataetum Bungerothii* (female), *C. callosum*, and various species of *Masdevallias*, *Cypripediums*, &c.

FORESTRY FOR SEPTEMBER.

Now that the ground is thoroughly saturated with moisture, the planting of evergreen shrubs, both for covert and ornament, should be proceeded with. When lifting the plants, care should be taken not to mutilate the roots, but sometimes roots are occasionally fractured and peeled to a certain extent by accident, even by the most careful workmen, and the bruised part should always be cut off by placing the knife below the root, and cutting upwards and outwards. When removing large Hollies, Yews, Portugal Laurels, &c., if a little soil adheres to the roots in the shape of a ball, it will prove beneficial in promoting the growth of the plants at the start. In cases where the soil consists of hard, infertile matter, mix a little leaf-mould or bog-earth with the staple before the shrubs are planted, and finish by staking, tying, and mulching them, if these operations are thought to be necessary. When planting groups of ornamental shrubs in exposed situations, it is a capital plan to erect a screen of evergreen branches on the exposed side of the group or plant, as the case may be, removing when the plants have taken to the soil.

Plant ornamental hedges and screen-fences of evergreens where desirable, and, if necessary, break up the ground thoroughly, pulverising it with a pick before planting. Hedgerow trees and isolated specimens should be examined at this season, and such as are showing marks of decay, or are past recovery, had better be cut down. It is, however, sometimes advisable to stub out hedgerow trees by the roots, and either plant another tree on the spot, or trench the ground and plant Quicks. Standard park trees often get greatly damaged by the elements, and by the soil becoming waterlogged through the bursting or the choking of drains in their vicinity, and when this is found to be the case no time should be lost in applying the proper remedy. No better time of the year could be chosen for cleaning out and sorting drains of this kind than autumn, in order to render the soil dry during winter; and in cases where the soil has become exhausted, a dressing of rich soil, leaf-mould, or well-rotted manure will be found beneficial in promoting the formation of fresh roots. It is also an advantage to have this sort of work carried out at this season, so that there shall be no interference with growing farm crops. These remarks apply to Conifers as well as to hard-wood trees.

SEED SAVING AND SEED SOWING.

Tree seeds should now be looked after, and collected as they become ripe—such as the cones of the *Abies* or Silver Fir tribe, as well as some of the rarer species of *Pinæ*, including the pretty little *Pine*, *P. parviflora*, whose cones are now matured, and if not looked after the seeds are sure to drop out and be lost. The cones of *Cupressus Lawsoniana* and others should likewise be collected as they become ripe, and stowed away in a dry place till they are wanted in spring. Sycamore and Maple seeds, of which there is a grand crop this season, should now be collected and kept in a dry place till wanted in the spring.

This is also the best time to make a selection of Cherry-stones, which should be sown at once on well-prepared friable soil formed into beds 4 feet wide. Sow the stones or seeds broadcast in a regular and uniform manner, and cover them with about 1 inch of fine soil. Birch-seed are generally matured at this season, and should be gathered in fine dry weather. These may either be sown at once, or mixed with damp sand, and kept till spring.

The best ground for Birch-seed is that of a mossy texture, formed into seed-beds about 4 feet wide. The seed should be sown broadcast on the surface, and trampled down in a uniform manner with the feet, which is all the covering that they require. Those who are anxious to have the true Weeping-Birch for embellishment, should collect the seeds from the best weeping varieties of the tree to be found in the natural forests of the Mar district of Aberdeenshire. Sow the seed at once where they are to remain without being transplanted, as transplanting alters the form and contour of this tree to a large extent; hence the many complaints that I have heard from proprietors, that they cannot get the true variety of this tree to purchase from the public nurseries.

MISCELLANEOUS.

Prepare a piece of sharp sandy soil on a northern exposure, and plant cuttings of Yew, Box, Laurel, Privet, and other hardy evergreen plants that are usually propagated by that method. Particular attention should be paid at this season to prevent weeds in the nursery or elsewhere from maturing and shedding their seed on the spot. Dig between the rows of forest and ornamental trees and shrubs, to keep down weeds and encourage root-action. Seedling Hollies and other small evergreen plants should now be removed from the seed-bed, and planted into nursery lines 12 inches asunder, and a few inches between the plants in the rows, choosing damp cloudy weather for the operation. *J. B. Webster.*

TREES AND SHRUBS.

PINUS RIGIDA.

Our excellent contemporary, *Garden and Forest*, has an interesting article on this tree, accompanied by a characteristic illustration of a weather-beaten old tree. It is one of the trees known as Pitch Pine, though it is not the one which yields the commercial product of that name. Pitch Pine of commerce is either *P. palustris* from the Southern States, or *P. ponderosa* from the North-west. Our contemporary adds, that there are a dozen other species to which the term Pitch Pine is locally applied, another instance not only of the nuisance, but of the mischief inflicted by the employment of uncontrolled names. In this country we note that *P. rigida* is specially liable to the formation of adventitious shoots from the trunk, so that if the top were destroyed the shoots in question would develop into a bush-like head.

BERBERIS CONGESTIFLORA HAKEOIDES.

When I saw this little shrub in flower against one of the walls in the Coombe Wood nursery, I thought it was the oddest Barberry I had ever seen, and so unlike any other in foliage and flower. It has small round leaves, beset all round with sharp spines, and quite glaucous on their under surfaces. The small bright yellow flowers are crowded into dense clusters in the axils of the leaves all along the young shoots, and looks like a long string of golden knobs. It appears to be similar in habit of growth to other Barberries, but being against a wall one could not tell. I suppose it is hardy, as it comes from Chili, as so many others from that region are. It is quite a choice shrub for those who take special interest in hardy shrubs. *W. G.*

PLANT PORTRAITS.

IPOMEA CAMARUNENSIS, Tauhert, sp. nov.—A tuberous-rooted species, with cordate ovate leaves, and a cymes of pink funnel-shaped flowers, *Gartenflora*, t. 1352.

JOCHROMA GESNERIODES and *J. WARSCEWICZII*, *Bulletin della R. Società Toscana di Orticultura*, July, 1891.

LOASA AMBROSIIFOLIA, *Westnik*, St. Petersburg, August, 1891.

MASDEVALLIA MACRURA, *Orchid Album*, t. 431.

NARCISSUS FENZII (*N. Pseudo-Narcissus* × *Cypri*, Haworth), *Garden Flora*, p. 429, 1891. *N. Cypri* is one of the *Tazetta* section. The hybrid is said to flower in January. Flowers white, intermediate in form between the two parents; corona yellow.

ODONTOGLOSSUM BERGMANNI, *L. Lind.*—Perhaps a white form of *luteo-purpureum*. *Lindenia*, t. 286.

ODONTOGLOSSUM MULUS HOLFORDIANUM, *Orchid Album*, t. 429.

ODONTOGLOSSUM POLYXANTHUM, *Revue Horticole*, August 16.

PEACH THE BRIGDEN, *Canadian Horticulturist*, July, 1891.

FRANCS HEMBLLOT, *Garten Flora*, t. 1353.

PHALENOPSIS SPECIOSA.—A species brought home by General Berkeley, and remarkable for its deep rose-lilac flowers. *Lindenia*, t. 288.

PINK MADAME ERNEST BERGMAN, *Illustration Horticole*, t. 131.—Pure rose flowers, free-flowering and fragrant.

PINUS CEMBAROIDES, *Garden and Forest*, July 29, 1891.—A rare Californian and Arizonan species, found more abundantly in Mexico, where the seeds form an article of food.

POPULUS MONTICOLA, *Garden and Forest*, July 15.—A new Californian Poplar, figured for the first time.

QUERCUS ALNIFOLIA, *Garden*, Aug. 1, 1891.—Leaves, bright gold coloured on the under surface.

TROLLIUS EUROPEUS, and *AURANTIACUS*, *Garden*, Aug. 1, 1891.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

PEACH-HOUSES.—When the fruits are cleared off the earlier trees, the latter are too frequently left without attention of any kind. This should not be, but the syringing of the trees should be performed every evening till the wood is mature, and the leaves have begun to take on the colours of autumn. Neglected Peach trees get infested with red-spider, which plays havoc with the foliage, premature ripening and loss of vigour following. Syringing will prevent this mishap, if it be supplemented by good root-waterings occasionally. The neglect of the latter, I am sure, often leads to bud-dropping when the trees are started. If a good thick mulch was afforded the trees, the border can be kept in a moist healthy state, and the need of root-waterings much reduced, but it should be examined occasionally, and its condition ascertained. Every ventilator should be put wide open. The borders in later houses require similar attention, as during the ripening of the fruit the borders will have been kept dryish, and the foliage not rendered clean by syringing. Remove all shoots that are weak, as also those which have borne fruit this year; doing this will admit light and air to those that remain. The late-fruiting trees should not be allowed to suffer from dryness at the roots, which will certainly spoil the flavour of the fruit.

Now is a good time to make notes of varieties to be purchased, lifted, or removed altogether. Young trees usually grow too fast, and transplanting is best for them; older trees which are growing too fast, being partially lifted. Peaches and Nectarines on the Plum stock soon make new roots after removal, which should take place as soon as the leaves part readily from the twigs. Trees in the early Peach-houses will now be ready for manipulation, and if any of them make too luxuriant growth, no manure need be mixed with the compost of good loam and mortar rubble and waste charcoal. After well watering the trees after planting, place a good mulch over the roots. I will give the names of a few good varieties:—Alexander, Early York, Hale's Early, and Condor; these all come in so much earlier than the older varieties, that when grown with others a break in the supply occurs, so that when these are planted in the second early house, they are often as early or earlier in coming into use as those in the first house. I would advise when these sorts are grown to give them a small house to themselves, or to plant them in the coolest part of the earliest house, and to plant only old early varieties. Early Mignonne, Dr. Hogg, Dymond, Royal George, these will follow those that I first named; Noblesea, Violette Hâtive, Barrington, Walburton Admirable, and Princess of Wales are also good varieties to succeed these. The large-fruited Peaches of recent introduction have only their size in most cases to recommend them, and in sunless seasons they are more lacking in flavour than those. The Nectarine requires the same treatment as the Peach, but the selection of varieties is

more limited, although of late years some fine new varieties have been brought out by Messrs. T. F. Rivers & Son. I have a great liking for Lord Napier for early fruiting, and it is our best Nectarine on the open walls or under glass. In some districts and soils it may not be so good as here on our light soil. Dryden is an excellent new Nectarine; I also like Darwin for its earliness; its flesh is of an orange colour. Elruge, Hardwicke Seedling, Humboldt, and Pine-apple, are excellent; this last is a grand fruiter. Pitmaston Orange is still one of the best, but it is delicate in constitution. Victoria and Violette Hâtive should not be omitted. The above give a fairly large list to select from, and I may here add, that I have grown them all, and others equally good and worthy of cultivation. *G. Wythes, Syon House, Brentford.*

PLANTS UNDER GLASS.

THE COOL CONSERVATORY.—At this season of the year this structure should be put in order, cleaned, painted, and repaired, all the wood-work being washed with soap and water; movable shading material should be taken down, dried and repaired, if necessary, before storing it away. Climbers will require thinning out and regulating, especially strong growers like *Tacsonia Van Volxemii*, *Cobæa scandens*, and several of the *Passifloras*, cutting the shoots back to their allotted space. Plants of *Plumbago capensis* and *P. c. alba* should be examined, and if found to be infested with thrips, they should be thoroughly cleansed of this insect by washing them with Gishurst soap or other insecticide. See that the borders in which are the plants are sufficiently moist, and in the case of exhausted borders, the application of a fertiliser will have a good effect on the flowering of these plants.

Lapagerias in bloom will require care, so that no injury be done to the flowers by scale insects, and thrips, which are very partial to this plant; and, should any of them be found harbouring on the plants when in bloom, the foliage should be washed with a sponge and tobacco-water.

Plants of any species which have stood out-of-doors during the summer—Camellias, Palms, Grevilleas, Rhododendrons, &c.—which are used in furnishing the conservatory, should be cleansed, the pots or tubs in which they are standing may be washed or painted as may be necessary before bringing them indoors. The display of flowering plants may consist of Balsams, Fuchsias, Coleus, Celosias, Begonias of various species, placing the last-named at the warmest end of the conservatory. *Nicotiana affinis* is a useful plant at this season, as is also *Cassia corymbosa*, which is also a very good autumn-flowering plant. The early-blooming *Chrysanthemums*, such as *Madame Desgranges*, yellowish-white; *Précocité*, creamy-white; *St. Mary*, white; *Gustave Wernig*, deep yellow; and *Roi dea Précoces*, crimson; will also be found of value in keeping up the gaiety of the display till the later *Chrysanthemums*, *Primulas*, &c., come into bloom.

HARD-WOODED GREENHOUSE PLANTS.—Preparations should be made to house all those subjects which have been stood out-of-doors, as after the third week in the present month it is no longer safe to trust tender plants outside, although the temperature may not fall so low as to injure the plants, but should it do so but a few degrees below 32°, the foliage becomes unsightly for a long time. In cases where a light framework of wood was erected, and coverings of some kind run over it at night and in wet weather, the plants may be left out-of-doors till the end of the month, without fear of them being damaged by too low a temperature. The return of bright sunshine will be very beneficial to this class of plant, providing means exist of preserving the plants from injury. Epacris, Boronias, Adenandras, and Darwinias should be amongst the first taken in, they being the first to suffer injury by low temperature. Carefully look over the plants, and free them from red-spider, thrips, and aphides before taking them indoors. These plants should occupy a position near the glass. Azaleas, Heaths, Neriums, and Acacias, *Telopeas*, *Banksias*, and *Eucalyptus*, may be kept out a few days longer than the first-mentioned. The Heath-house and other structures, in which these plants are placed, must be well cleaned, walls lime-washed, &c. Less water will be required than in the height of the growing season, but great care must be taken in not allowing the soil to become so dry as to stop root-action, as the stronger-growing subjects will still continue to push out roots, although there may be no top-growth discernible. *R. Milner, Penrice Castle, Swansea.*

THE KITCHEN GARDEN.

CAULIFLOWERS.—Plants raised from seeds sown in August should be pricked out when large enough in beds in a warm aspect. In drawing these plants from the seed-bed, reject all those with crooked stems, or otherwise weak and unhealthy, and clear them of damaged leaves. Plant in rows about 4 inches apart, and do not bury the stems deep in the soil. Gently water them with a fine rose-pot, so as not to break their leaves, or wash the earth into the heart of the plants. If the plants are small or backward in growth, a frame may be placed over the bed, and the lights made use of till the seedlings have taken root, shading them lightly if the sun be very hot. The lights need not be put on unless frosts threaten, or during heavy rain. Any Cauliflowers which were planted out early in July for the Michaelmas crop, will soon begin to show their flower-heads, and should be encouraged in growth by hoeing between the rows, and drawing soil up to the stems; if the weather should continue dry, it will benefit the plants to form a basin round each, and afford water or liquid manure abundantly, if large succulent heads are desired.

SEED SOWING, ETC.—Continue to plant out Lettuce and Endive as the plants become ready. Make small sowings of Lettuce, Endive, Radish, Cauliflower, and Cabbage for late planting, these often coming in very useful when hard weather has killed earlier-sown ones.

CHICORY.—Some of the largest may be lifted, the leaves cut off half an inch above the neck, and placed in the dark to get blanched, using for this purpose wooden boxes filled with light mould, or making a bed of similar material. When planted, afford one good watering, and keep all light away from them.

TOMATOS.—Remove growing shoots, and expose the fruit to the sun; any that are nearly ripe being plucked, and placed on the shelves in any dry greenhouse or vinery to ripen.

CAPSICUMS.—Plants growing out-of-doors may be pulled up when a sufficient number of ripe fruits are to be found on them, hanging up the plants indoors, so that the fruits may mature. Another way is to gather the pods as they become ripe, and dry them in the shade. Lights should be put over plants of Aubergines growing on borders.

TURNIPS.—The late Turnips should now be thinned out to suitable distances, and the hoe plied amongst them until such time as the leaves touch each other. Late-sown Spinach should be weeded and thinned, using when the soil is dry a small hand hoe for the purpose. In wet weather this kind of work is best done by hand-pulling. *C. J. Waite, Glenhurst, Esher.*

THE ORCHID HOUSES.

EAST INDIA-HOUSE.—The temperature of the past week has been more favourable for the ripening of the growths of those Orchids that are grown all the year round in this house, and the bottom and top ventilators have been open at all times, and artificial heat has been seldom made use of. It is better practice now to be a degree under than to go over 70°. Many of the *Phalenopsis* will now be finishing up their leaves, and showing flower-spikes; and if the house be kept too moist and very warm, their leaves are apt to prematurely break away, and the plants seldom finish properly; but by affording good ventilation and a little lower temperature, premature starting can be prevented.

Angraecum sesquipedale should be placed in a warm part of the house, where moisture is more abundant than elsewhere, the plants being now in full growth; and they will not rest until the flowering is past. *A. Scottianum* seems to be a species that will flower at any season; it grows freely, and is seldom found in an unhealthy state. *A. Sanderianum*, a splendid introduction, is somewhat difficult to manage; the small and pretty *A. hyaloides* is always admired when in flower, and it grows well when hung up in small baskets, as does *A. citratum*, and both like strong heat and a temperature laden with moisture. The plants in this house should be looked over occasionally for thrips, these insects being specially injurious to the young leaves. It is safest at this season to keep most of the plants somewhat on the dry side, the next six weeks being, perhaps, those during which it is the most difficult to keep plants in a healthy state.

THE CATTLEA-HOUSE.—Where the convenience exists, it will now be an advantage if plants of *C. Skinneri* are removed to warmer house to complete their growth. The amount of moisture in the house

should be reduced, or the rotting of the unripe pseudobulbs may ensue, and especially if the plants have been in sufficiently ventilated in summer, and growths which appear in fine condition one day, in two days afterwards may be rotting. A temperature of 66°, with much less moisture, will keep the plants sound. *A. G. Catt, Parkfield, Hallow.*

THE HARDY FRUIT GARDEN.

With bright sunshine let us hope that, notwithstanding the late season, the wood, by the end of the season may get thoroughly ripened, so that we may build up hopes of a good crop of fruit the next year.

PEACHES AND NECTARINES.—These, owing to the strong heat, are ripening their fruit very fast, and will require going over daily, gathering the fruits a little under-ripe than otherwise, placing them with care in an airy and well-ventilated fruit-room to finish. These fruits, I find, at this season of the year, are always much better in flavour, and more juicy, than if left on the trees to ripen. Some gardeners go to the extent of placing nets over the trees, making them secure at the bottoms to catch the fruits as they fall; but this, I maintain, is a great error, as the fruits not only get bruised, and spoiled in appearance, but the flavour is very deficient, and the flesh woolly. I find the best plan is to take the handbarrow, placing either a layer of cotton wool, or short grass, on the bottom, putting the fruit carefully on it; they may then be carried to the fruit-room without fear of damage. Keep a careful watch on all later trees heavily cropped, and should the roots get dry, water abundantly with slightly tepid water, assisting the trees also to finish the crop with manure water or other stimulants. Early trees, whose fruits have been cleared, should also receive attention, both at roots and overhead, syringing thoroughly in the morning. To keep the foliage clean and healthy, always give the foremost attention to those trees bearing the best and heaviest crops of fruit to help them to maintain vigour, and keep up their regular cropping.

APRICOTS.—If mildew put in an appearance, dust thoroughly with flowers-of-sulphur. Dryness and impoverished soil are the main causes of this evil, consequently, water thoroughly and feed well; this will greatly benefit the trees, and strengthen the buds for the following year's crop. I attribute the loss of nine parts of the flowers which open early in spring, only to drop, to dryness of soil and want of nourishment at the roots at this season of the year.

MORELLO CHERRIES.—As the fruits are gathered and the trees cleared, remove the nets, and neatly bundle them up in pieces, labelled for their different purposes, together with the size of each piece. A few good dressings at the roots will also be beneficial to the trees, though not unfrequently they get neglected. These bearing on spurs the new wood should be pruned accordingly, always laying in plenty of it to keep the trees thoroughly supplied with fruiting shoots all over them. A slight pruning after the fruits have been gathered will be of great assistance to the ripening up of the shoots reserved for this purpose. *H. Markham, Mereworth Castle, Maidstone.*

THE FLOWER GARDEN.

THE BEDS.—The fine weather experienced during the last week has greatly improved the appearance of the beds and their surroundings. Fuchsias and Lilliums, also pyramids of Pelargonium Madame Crouse, Heliotrope, Calceolaria amplexicaulis, Petunias, &c., are now as gay as they have been at any time during the season. The above subjects either growing in pots plunged below the rims in the green sward irregularly in appropriate places, with similarly trained plants of *Acacia lophantha* and *Abutilon Thomsonii* intermixed, or planted in large beds carpeted with blue or yellow *Viola*, and edged with *Coleus Verschaffeltii*, are very effective. There are nooks and corners in most gardens that would be rendered more beautiful in this manner. They are of easy culture, and rapid growers, and may be trained into any shape. In order to prolong the flowering period as long as possible, the seed-pods should be kept picked off all flowering plants from the time it is desirable to allow them to flower until the flowering time is over. Fuchsias are likely to be used on the flower garden more extensively in the future than they have been in recent years. They are showy and graceful. I refer to them now, so that those who contemplate using them next year in the manner indicated may propagate a stock forthwith.

LOBELIAS.—Those having a good strain of *Lobelia* should pot-up a dozen or two plants from the mixed beds for propagating in early spring. Take the plants up with nice balls, and place them in pots 4½ or 6 inches in diameter, using light sandy mould, and about 1½ inches of crocks, with a few half-decayed leaves over them in the bottom of each pot for drainage; afterwards giving water to settle the soil, and placing the plants in a cool pit, where they can be kept close and shaded for a few days until re-established, when they should be gradually given plenty of air. Before potting, cut away all flower-spikes and straggling roots. See that the necessary number of stock plants of the several varieties of the *Alternanthera*, *Mesembryanthemums*, *Ageratums*, *Salvias*, and *Verbenas* are struck.

CALCEOLARIAS, ETC.—Cuttings of *Calceolarias*, *Leucophytons*, *Gnaphsliums*, *Violas*, and *Pansies* that strike best in cold frames, should be seen to, lest the young growths get injured by frost. A shallow frame placed on a hard surface, gravel or clinkers covered with cinders and coal-ashes, in front of a south wall, is best. Put a layer of short dung to the thickness of 2 inches in the bottom, then about 3 inches of light loam with a surfacing of sand. In this insert the cuttings, which should be from 2 to 3 inches long, in rows about 4 inches apart, and at the same distance from plant to plant in the rows, making the soil firm about them with the dibber, then giving water to settle the soil. Keep the frames close, and shade the cuttings for a few weeks until they have callused, when a little air may be admitted; damp the cuttings overhead in the afternoon of bright days when closing the frames. As soon as they show signs of being rooted, admit plenty of air to them on all favourable opportunities, drawing the sashes off and replacing them at night; the object being to prevent them making much growth before spring. *H. W. Ward, Longford Castle, Salisbury.*

THE APIARY.

WAX REFINING.—It is but seldom that one sees directions given for refining bees-wax. Prizes are offered at nearly all the leading honey exhibitions, and examples are often shown that do not come up to the mark. The finest and best-coloured wax is made from new comb and wax cappings; old black combs yield but very little, and should be melted down by themselves. The wax-extractors ordinarily sold are very good for making small quantities, but to make them more effective, the perforated comb-holder should be enclosed in a flannel bag, so that all the impurity is left behind at one operation, and the wax is of finer quality if run into warm water when it leaves the extractor. Another plan is to place the combs in a flannel bag, and suspend it in an oven over a pan of water; but perhaps the best way for large quantities is to use a copper. In this case, a hoop of wood or stout wire should be made a little larger than the top of the copper, and have a piece of flannel sewn to it, so as to make a shallow bag, in which to place and suspend the combs. The copper should be about half full of water, but care must be taken that it does not touch the flannel—the steam only is required for the operation. When the water cools, the wax can be taken off in a cake perfectly pure, and then remelted and run into moulds for show or other purposes.

RE-QUEENING.—There is still time to furnish stocks with young queens, which may be obtained from skeps that have been saved from the sulphur-pit, and the safest way to introduce the new queen is by placing her in the tubular cage, plugged with candy at one end, and corked at the other, and pressed down between two combs. Driven bees should now be placed on frames containing built-out combs, and ted up as rapidly as possible with syrup at a temperature of about 100°.

PREVENTION OF INCREASE.—Some bee-keepers who have as many stocks as they require, complain of the difficulty they experience in preventing increase. An easy, and at the same time a good way, if swarming cannot be prevented, to accomplish this, is to have a nucleus hive of about seven frames capacity standing by the side of the swarmed stock, into which transfer some of the brood-combs with adhering bees, and return the swarm to its old quarters. In the autumn the old queen can be deposited, and the nucleus containing the new one united to the original stock, by which means it would be in the best of condition to commence another season's work, and there would be no loss of honey. *Expert.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, SEPT. 22.—Royal Horticultural Society, at Drill Hall; Lecture on "Insect-eating Plants," by Messrs. R. Lindsay & Lewis Castle; and Exhibition of Insect-eating and Pitcher Plants, Flowers, Fruits, and Vegetables.

SALES.

MONDAY, SEPT. 21.—Great Clearance Sale of Plants, Greenhouses, &c., at Beves' Nursery, Acton, W., by Protheroe & Morris (four days). Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs, at Stevens' Rooms.

TUESDAY, SEPT. 22.—Dutch Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, SEPT. 23.—Dutch Bulbs and Plants, at Protheroe and Morris' Rooms. Dutch Bulbs, at Stevens' Rooms.

THURSDAY, SEPT. 24.—Dutch Bulbs, at Protheroe & Morris' Rooms. Stove and Greenhouse Plants and Orchids, at Camden House, Sutton, by Protheroe & Morris. Greenhouse Plants at Enfield, by Protheroe & Morris. Special Sale of Dutch Bulbs, at Stevens' Rooms.

FRIDAY, SEPT. 25.—Collection of Established Orchids, formed by the late H. J. Eucban, Esq., of Southampton, at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 26.—Dutch Bulbs, at Protheroe & Morris' Rooms. Greenhouse Plants at Eltham, by Protheroe & Morris. Dutch Bulbs, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—56°·3.

The season of the year will soon arrive when the dwellers in our great cities will have to endure the miseries which fog, *i.e.*, that is, in their case, mist mixed with the products of the combustion of coal, will bring them. To know what are the opinions of experts, who have given considerable attention to the subject of town fog, and to know how the evils attendant on the non-combustion of coal smoke may be best met and minimised, may afford those of us who are constrained to live in or near cities, or to carry on gardening operations under such untoward circumstances, some kind of satisfaction. We therefore lay before our readers a report of some recent proceedings.

At the International Congress of Hygiene and Demography, Dr. W. J. RUSSELL, F.R.S., read a paper on "Town Fogs and their Effects," in which he dealt, first, with the circumstances which lead to the formation of fogs, and pointed out that dust particles are necessary for their production, but may be filtered out of the air by passing it through cotton-wool. He then referred

to AITKEN's experiments on dusty and dust-free air, and pointed out the smallness of the amount of matter capable of determining the formation of fog, and that even purely gaseous products cannot pass away when a fog exists, as is shown by the accumulation of carbonic acid which then takes place. Taking 4 in 10,000 volumes as the amount of carbonic acid in London air, he had found it increased in a dense fog to 14·1, which must represent a very serious accumulation of the general impurities of the air. Products of complete combustion are capable of acting as fog producers. There is great variation in the character of fogs, from wet fogs to dry fogs, and they may be made to give their own account of their constituents by analysis of the deposits they leave. As to the meteorological conditions under which fogs usually occur, the persistence of fogs above the dew-point is noticeable; some fogs do not reach the ground, but exist only in the higher regions. The impurities in the air of towns are absorbed by fogs. An estimation of sulphates, chlorides, and organic matter in London fog, and comparison of amounts, show that they are greater than in the air of the suburbs. Quantitative determinations have been made of fog-deposits collected at Kew, Chelsea, and Manchester, showing the quantities of soot and dust contained in them. At the Kew Orchid-houses 20 square yards of roof yielded 30 grammes of deposit, representing 22 lb. to the acre, or 6 tons to the square mile. Mr. DYER said the deposit at Kew was "like brown paint." An examination and analysis had been made by the Manchester Committee, and important and interesting experiments there carried out showed the presence of a large amount of metallic iron and magnetic oxide. Evidence showed that fogs have increased in London and other towns, and that there is a relationship between the increase of dark fogs and the consumption of coal in London. In regard to the effects produced by fogs, it was stated that a three days' fog at Manchester produced a deposit containing per square mile 1½ cwt. of acid and 13 cwt. of blacks. The general effects on the human subject were serious, and statistics showed that the death rate is seriously affected by fogs. In the London district (an area of 15 miles round London) in 1875, 4,880,000 tons of coal were consumed, while, in 1889, the consumption had risen to 6,390,000 tons, and supposing only one per cent. of the sulphur escaped and accumulated in fogs, that would represent a serious impurity. A marked effect was produced by them on plant life, as shown by the experiments made at Chelsea by Dr. FRANCIS OLIVER for the Royal Horticultural Society. Town fog has a powerful destructive action on many kinds of plants, and interesting results had been obtained from an investigation of the nature of the specific poisons which may exist in fog. Fogs are, in almost all cases, produced by a sudden and great reduction in temperature, with a large resulting increase in the death-rate, which is, however, attributable rather to the sudden fall in temperature than to the fog itself. Fogs have a great action in absorbing light, and have a special power of absorbing the more refrangible rays. An estimation of the amount of gas burnt in London to compensate for the light absorbed by fogs gave 25,000,000 cubic feet in London in one twenty-four hours' day during the winter. Deleterious effects on health must arise from this absorption of light. A comparison of the amount of sunshine in London with that in the neighbourhood, and some other places, resulted much to the disadvantage of the metropolis. Experiments on the distances at which objects are visible during a London winter showed the density and opacity of London fogs. Upon the questions whether fogs can be abolished from towns, and whether, if not abolished, they can be rendered free from foreign matters, the answer was that as long as coal is burned in towns dense fogs must form. Fire-grates, kitcheners, and furnaces might be much improved, but it was improbable that the improvement would be so great as to ensure perfect combustion. The alternative was to adopt gas and coke for fuel. Even then the presence of sulphuric acid

in the air would still have to be considered, but our fogs would at least be whiter. The social aspect of the question still remained, namely, how to compel people to give up using coal, for it was impossible at the present day to do as was done in the reign of EDWARD I., that was to try, condemn, and execute a man for burning coal in the City of London. Mr. HARTOG, in reference to the investigations and experiments which had been made on the subject in Manchester, said, the first thing they desired to ascertain was, the amount of sulphur as an indication of what the presentible impurities were, which, of course, included the products of combustion in animal bodies, sulphuric acid being of course due wholly to coal combustion. Significant results were obtained. In the centre of Manchester, during three days' snow, 10 milligrammes of sulphuric acid per metre were found deposited on the first day, 19 on the second, and on the third it had risen to 31. Three miles from the centre of the town only 7·5 milligrammes were found on the third day. This showed the necessity of having various stations for obtaining trustworthy information. Other experiments in Manchester led to similar results in regard to the impurities in the atmosphere, and great advantage might be obtained from experiments of the same kind in other large towns in the country. An interesting description was then given of the apparatus for determining the amount of sulphurous acid in the air. Dr. RUSSELL had collected the dust from the air by using cotton-wool, and his example was followed in the Manchester experiments. They also used permanganate according to TRIVY's method. With Dr. RUSSELL they entirely agreed also as to the serious effects from want of light in foggy weather. Like him, the Manchester Committee was unable to prescribe a panacea for fog, but their object was at all events to take the first step of ascertaining and describing its symptoms.

Professor F. W. OLIVER, of Kew, then read a paper upon the "Effects of Fog upon Plant Life." He said those effects were found to be very marked in Orchid collections, and were injurious to the leaves, foliage, and young shoots of plants and flowers at even 40 miles distance from London. Their nutritive organs were affected and destroyed, and they died. As regards the injurious constituents of London fog, sulphurous acid was conspicuous; in Manchester, hydrochloric acid. By experiments in closed chambers, he had been able to produce upon plants all the effects and phenomena of London fogs. The changes produced were a gradual swelling, and then breaking down of the protoplasm, resulting in the death of the plant in three-quarters of an hour or less. No doubt the sulphurous acid in fogs was the chief cause of mischief to both animal and vegetable life. The tissues of leaves absorbed metallic oxides, particularly iron from fog deposits. It had been found necessary for the preservation of plants at Kew, as for the protection of legislators in the House of Commons, to filter the air through cotton wool, and to supply the deficiency of light in foggy weather by electric illumination.

THE APPLE AVENUE AT WALTHAM CROSS.—

The illustration (fig. 39) represents an avenue of fruit trees, 400 yards in length, in Messrs. WILLIAM PAUL & SON'S Nurseries at Waltham Cross, Herts. There are 500 trees, each of a distinct kind, 2 yards apart, 250 on each side, varying from 20 to 30 feet in height, mainly pyramid Apples on the Crab stock, but comprising also Pears, Cherries and Plums. It was planted about thirty years ago, but since that time many trees have been discarded as worthless, and better sorts put in their places. The soil is a tenacious loam, 2 to 3 feet deep, lying upon pebble-gravel subsoil; it is well drained, and the only manure ever used in the nurseries is rotted stable-dung, and that sparingly. That the place is well adapted for fruit culture is seen in the healthy state of the trees, absence of canker, and other diseases. Besides being a trial-ground, the avenue of old trees is used as a source of buds and grafts, thus ensuring correctness in nomenclature. Summer pinching is

persisted in to allow the sun to enter the interior of the trees, and to develop fruit spurs the whole length of the branches. All the best varieties of fruits were here, and bearing abundantly such Apples as Worcester Pearmain, Ribston Pippin, Cox's Orange Pippin, Lord Suffield, Lord Grosvenor, Devonshire Quarrenden, Meloo, Peasgood's Noosuch, Lord Derby, Emperor Alexander, New Hawthornden, &c. A variety like Cox's Orange Pippin, named Mabbett's Pearmain, a mid-season Apple, was particularly fine. Plums, such as Kirke's Czar, Quillin's Gage, Jefferson, Victoria, &c. Pears were very fine, Thompson's, Doyenné Bonssoch, Beurré d'Amanlis, and a coloured variety of the latter called Punachée, with crimson and gold stripes; Pitmaston Duchess, and several others.

BRITISH MOSSES.—The Rev. H. G. JAMESON has reprinted from the *Journal of Botany*, his useful *Key to the Genera and Species of British Mosses*, which may be had from Messrs. WEST, NEWMAN & Co., 51, Hatton Garden. It is based upon HOBBIK's *Synopsis* and BRAITHWAITE's *British Moss Flora*. A plate giving illustrations of some of the terms used is very useful. It is interesting, too, to note the germination of Mosses with or without a protonema.

CINGALESE PLANTS.—We have received a copy of the "Catalogue of Orchids, true Ferns, Cycads, Palms, hulbs, &c.," to be had of Messrs. J. P. WILLIAMS & BROS, Heneratgoda, Ceylon. The list is an interesting one to plant lovers and wholesale dealers.

227 trees of various descriptions which they would be very glad to place at the disposal of any parties who would claim them, and pay the expense of planting them. Otherwise, the whole thing must drop to the ground. Mr. WIGHAM RICHARDSON moved— "That inasmuch as the Newcastle Corporation are about to apply to Parliament for further powers in connection with their bye-laws, the Tree Culture and Protection Society respectfully suggests that special powers be taken to plant and maintain trees within the precincts of the city, and to enforce the laying out of new streets, and particularly of main thoroughfares, of such a width that trees may be planted either in single or in double rows along each side, or in single or several rows along the middle of any street or thoroughfare which the Corporation

FIG. 39.—THE APPLE AVENUE IN MESSRS. W. PAUL AND SON'S NURSERY. FROM A PHOTOGRAPH. (SEE P. 340.)

GREAT MALVERN.—It is arranged to hold a large Chrysanthemum and Fruit Show at Great Malvern in November. An influential list of patrons and a good committee having been secured to carry it out, a good exhibition may be expected. Mr. ARTHUR D. MELVIN, Madresfield Estate Office, is Hon. Sec.

SIR TREVOR LAWRENCE, M.P., has been spending the recess in the Hartz Mountains. Lady LAWRENCE, who accompanied the Hon. Baronet, returned to Burford Lodge, Dorling, recently. Sir TREVOR, who was detained in Belgium, returned to be at home on the coming of age of his eldest son on the 17th inst.

NOVA SCOTIA APPLES.—The Apple crop, on the whole, is not expected to reach the average.

TREE CULTURE AND PROTECTION SOCIETY.—A meeting of the committee of the Newcastle Tree Culture and Protection Society, says *The Newcastle Daily Leader*, was held in the studio of Mr. T. H. CAMPBELL, Pilgrim Street, Newcastle-on-Tyne, last week, under the presidency of Alderman W. D. STEPHENS. The financial statement showed that there had been received £52 7s. 6d., and after meeting all liabilities there remained a balance in hand of £3 12s. 6d. The sum of £2 had been received towards defraying the cost of planting trees in Belgrave Terrace. The Chairman thought the society could not undertake the planting of trees in Belgrave Terrace, which would cost £30. They were willing to give the trees, provided the people in that particular district subscribed towards the cost of planting them. They had

may determine." It was decided to forward a copy of it to the Council for consideration.—Mr. WIGHAM RICHARDSON stated that the County Council of Northumberland, in conjunction with that of Durham, intended to consider the river smoke nuisance. He believed that was due very much to the work of their society. Sir MATTHEW WHITE RIDLEY had interested himself in the subject, but the difficulty seemed to be to find a prosecuting body. He thought it would be discussed at the next meeting of the County Council, and he understood the question would be put, whether the Tree Culture Society would interfere so far as to prosecute. Alderman STEPHENS said, if the County Council would find the cost of prosecuting, they would do the work willingly.

ROYAL DUBLIN BOTANIC GARDENS.—We find

in the *Daily Graphic* of September 15, the following brief account of the above Gardens, together with illustrations of the Palm-house, Curator's house, a Sequoia gigantea, and the bridge and lake; and, curiously enough, a bunch of Sarracenias, labelled Orchids (!), raised in the Gardens. "Just one hundred years ago, the 'Right Honourable and Honourable Dublin Society' obtained a grant from the Irish Parliament for the establishment of a Botanical Garden for promoting scientific knowledge in the various branches of agriculture, and to foster and increase a taste for practical and scientific botany. A site for the garden was chosen about 2 miles from Dublin, on the banks of the Tolkat, a picturesque trout stream running through the village of Glasnevin. The neighbourhood is one not only of great natural beauty, but also of much classical and historical interest. Here at various periods have lived SWIFT, ADDISON, SHERIDAN, THOMAS PARNELL—who assisted POPE in his translation of the *Iliad*, DEAN DELANY, 'Stella,' and other literary celebrities. The ground selected had formerly been within the demesne of TICKELL, the poet, by whom many of the trees still growing in the gardens were planted, and whose house is at present occupied by the Curator. From their establishment down to 1834, the gardens did not undergo much alteration or improvement. In or about the year 1834, however, Mr. DAVIN MOORE was placed in charge, and under his energetic Curatorship of upwards of forty years, public attention was drawn to the gardens, and very much undertaken to bring it to its present order. The gardens now cover an area of more than 40 acres. They are admirably laid out, and can boast of a splendid range of conservatories, together with an enormous Palm-house. This was built in 1884 to replace the first one, which had been destroyed by the storms of the previous autumn. There is also a house for Ferns, and what is called the 'Victoria House,' in which during the summer floats the splendid Victoria Regia Water Lily. In the conservatories there are many rare and beautiful exotic plants. It is here that the annual display of Chrysanthemums, which always proves such a source of attraction to the good folk of Dublin, is held every autumn. The great Palm-house also attracts many visitors. Until 1887 the gardens remained under the control of the Royal Dublin Society. In that year, however, they were transferred to the Government; the whole is now being placed in connection with the Science and Art Department. Dr. MOORE died in 1879; it is his son, Mr. W. F. MOORE, who is now in charge as Curator."

DEATH FROM DRINKING A WEED-KILLING COMPOUND.—On Saturday, the 12th inst., an inquest was held at Cirencester by Mr. Deputy-Coroner SMITH on the body of H. L. SMITH, aged about two years, who died on the previous Wednesday. The father of the boy, the Superintendent of the Cemetery, had been using a preparation called the "Luda," for the purpose of destroying the weeds on the walks. He had measured out the liquid with a jug, and left the jug turned upside down, which the child afterwards placed to his mouth. The fluid was thick, and would adhere to the rim of the jug, and although only a small quantity could have been swallowed, the child died within eight hours. Too much care cannot be taken to keep these deadly preparations out of the reach of children and others. It comes as a surprise, in view of the stringent regulations enforced in regard to the sale of poisons not a whit more dangerous, than these excessively poisonous weed-killers can be purchased freely by anyone.

WILD MAIZE.—Mr. SERENO WATSON, in the last part of the *Proceedings of the American Academy of Arts and Sciences*, p. 158, mentions a wild species of Maize found in the State of Guanajuato (Mexico), seeds of which were grown in the Botanic Garden, Cambridge. The plants flowered this season, and were found to be quite different from ordinary Maize. It was at first thought that the original

wild state of the cultivated Maize had been secured, but on careful comparison, Mr. WATSON comes to the conclusion that the plant in question belongs to a new species.

CHAMÆDorea PRINGLEI.—This is a newly-discovered Palm, growing in San Luis, Potosi, and the most northern locality known for any species of this genus. It is described by Mr. SERENO WATSON in the *Proceedings of the American Academy*, vol. xxvi. (1891), p. 157.

AN ELECTRIC GARDEN ENGINE.—Messrs. MERRYWEATHER & SONS, of 63, Long Acre, have a novelty in small pumps, worked by the electric current. As many of our country seats are now supplied with electric lighting machinery, it may be well to consider how the electric "stream" may be further utilised. Messrs. MERRYWEATHER's pump is well suited for garden work, as it is only necessary to fix it by a pond or fountain, and attach a suction and delivery pipe, when the little engine will project the water in the usual manner.

JAMAICA.—Mr. W. FAWCETT, the Director of the public plantations, has printed a useful Index of the economic products derived from plants native to Jamaica. The list will be very useful for reference.

SEEDLING SUGAR CANE.—In the twenty-fifth annual report of the Queensland Acclimatisation Society, Mr. SOUTHER, the manager, records that on visiting Bundaberg, in the Wide Bay district, he observed almost every plant producing "arrows" (inflorescence). Seeds were collected and sent to Brisbane, where, ultimately, seventeen plants were raised, representing five varieties.

FUCHSIAS AT THE CHARTERHOUSE.—In the gardens of the Charterhouse there is, said the *Daily Chronicle* recently, perhaps the finest collection of Fuchsias in this country—certainly in London. Mr. HENRY HAMMERTON, who has charge of the gardens at the Charterhouse, estimates that he has 190 Fuchsias at present in all the pride of bloom. The plants are arranged in little groups at the doors of the houses, or spread out in rows along the sides of the wall in, say, "Old Wash-house-square." For ten or a dozen years Mr. HAMMERTON has gone on cultivating the Fuchsias, to the growing pleasure of their natural guardians, the brothers of the Charterhouse. Strictly, the Charterhouse Gardens are not public, but the permission to visit them is merely a matter of form. The show—that word may fairly enough be used—includes about 10 varieties of the Fuchsia. Only the varieties which can stand the smoke and dust and destructiveness of a London atmosphere are cultivated. But they are cultivated to remarkable perfection; some stand 8 feet in height, others 6, others 3 or 4. All are alike in the richness of their flowering, and in the shading and deep colouring of their petals. No doubt it is a triumph to grow Fuchsias so successfully in the heart of London, but it is a triumph involving immense care and trouble. In winter the plants are protected in a 40° temperature, and during the spring, summer, and autumn they are carefully nurtured on a specially prepared diet, whose ingredients need not be discussed. One of the most successful Fuchsias at the Charterhouse is that which gardeners know as Scarcity, so called because fanciers cannot get enough of it. A brother of the name of JOHN HUGHES introduced this variety to the Charterhouse, and so the brothers call it John Hughes. Another species, Lady Elizabeth—its petals are marked with white, against the purple and blue of Scarcity—also does unusually well, and the same can be said of the variety Dan'l Lambert. Yet another member of the Fuchsia tribe, Neptune, is remarkable less for the grace of Lady Elizabeth, or the magnificent petals of President Garfield, than for the length of time it keeps in bloom. Lincolnshire White does very well, but, as a gardener would say, "flowers itself to death," and wants a lot of tying up. A new plant, known as White Petticoat, has been introduced at the Charterhouse, but it

remains to be seen whether it can grow and thrive upon our London air. People who want to know more of the Charterhouse Fuchsias should visit them; the gardens in which THACKERAY and HAYLOCK and JOHN LEECH played as boys make a fine lung in our metropolis.

MESSRS. KEYNES, WILLIAMS & CO.'S NEW CACTUS DAHLIAS.—Among the numerous excellent stands of Dahlias staged by the above firm, but not for competition, at the Wilts Horticultural Society's Show, held in Salisbury on the 12th inst., was one containing twelve seedlings of the Cactus, which will put many of the older varieties completely in the shade. They are St. Catherine, bright yellow, the back petals being shaded amber, a true Cactus, surpassing Juarezii in its long gracefully-pointed petals—the best Cactus Dahlia hitherto seen; awarded a First-class Certificate. Keynerith, light crimson with a tinge of golden-yellow at the base of the petals, of splendid Cactus form, and in every way a decided acquisition; a First-class Certificate. Dr. Masters, light blush, a good addition to the light class of decorative Dahlias. Baron Schroder, pleasing shade of bright purple, of the light Cactus form, and in every respect an improvement; First-class Certificate. Mrs. Arthur Newall, reddish-chocolate, new in colour, and quite distinct. Lady Pembroke, a pinkish shade of lilac, quite new in colour; First-class Certificate. Lady Radnor, a pinkish shade of salmon, with the base of the petals primrose, one of the prettiest shades of colour.

NARCISSUS VICTORIÆ ×.—In the last number of the *Garden Flora*, M. SPRENGER describes a hybrid Narcissus between *N. pseudo-Narcissus* and *N. aureus*. The flowers are in tufts, yellow, with a deeper-coloured cylindrical crown.

"JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—The last part issued contains various papers read at the meetings of the Society on Cyclamen, Snowdrops, Lachenalias, Cape Bulbs, and Hybrid Rhododendrons. The latter paper, by the Rev. Professor HENSLOW, is a valuable and original contribution to the subject of cross-breeding.

BOURNEMOUTH AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—The third annual excursion of the above association was made to the Earl of RADNOR's garden at Longford Castle, Salisbury, on Wednesday, September 9. The party included Dr. HITCHCOCK (President of the Association), and Messrs. J. A. FYLER, J. J. SWAFFIELD, G. WATTS, jun., W. WATTS, and J. PHILLIPS, nurserymen. A pleasant walk from Alderbury Station brought them to an entrance of Longford Park, where they were welcomed by Mr. WARD, the head gardener, two of his sons, and Mr. WARDEN the gardener at Clarendon Park, who conducted the party over all parts of the garden. The bedding-out on the terrace, the fine crops of fruit under glass and in the open air, the capital kitchen gardens, &c., all came in for a share of admiration. After a luncheon in a tent, kindly lent by his lordship, the afternoon was spent in cricket and other amusements, the party returning to Bournemouth delighted with their excursion.

EUCALYPTUS.—Messrs. D. McALPINE and J. R. REMFRY have published, in the *Transactions of the Royal Society of Victoria*, an interesting communication, illustrated by lithographs, showing the structure of the petiole in some thirty species of this genus. There can be no doubt that the minute anatomical characters are valuable for the purpose of discrimination; but before we can decide upon the degree of value they have, it will be necessary to study the anatomy of the different species in different stages of growth, and from specimens taken from plants growing under different circumstances. The thickness of the hard bast, or skeletal tissues, for instance, probably depends on the conditions under which the plant is growing. It is obvious, therefore, that extensive comparative research is necessary before the value of the

characters relied on by Messrs. McALPINE and REMFRY can be fairly estimated; but, in the meantime, those gentlemen have earned the thanks of the botanists for their careful researches, and stimulated their hopes for further results of a similar kind.

THE PRESENCE AND FUNCTION OF SULPHUR IN PLANTS.—Messrs. BERTHELOT and G. ANDRÉ, two well-known French scientists, have recently been investigating the rôle played by sulphur in the economy of plant life. They examined the following plants: *Sinapis alba*, *Camelina sativa*, *Allium cepa*, *Lupinus alba*, *Urtica dioica*, *Tropæolum majus*, and *Avena sativa*; and determined the sulphur in the seed and in the plant at the various stages of germination, flowering, and fructification. It seems that the total quantity of sulphur increases continually from germination to inflorescence, but the relative quantity is about one-third higher in the earlier stages of growth. The organic sulphur reaches a maximum when the plant is in flower, and afterwards decreases. Since organic sulphur is found in the roots, especially during the time of flowering, it is probable that the sulphur is not absorbed from the soil entirely in the form of sulphates. The proportion of these two forms of sulphur varies considerably in different species, and the final reduction of the proportion of organic sulphur is due partly to elimination in the form of volatile compounds and partly to reoxidation during fructification.

THE RAISING OF A GOOD SEED POTATO.—In a paper on this subject, F. BLENSON states that the whole method of culture in Potato-growing seems to exert a somewhat deleterious influence on the plant, and that, therefore, degeneration easily occurs in Potato varieties. Sufficient care is not bestowed upon the selection of the seed: smooth, medium-sized tubers are the best for producing heavy crops of full-sized tubers. Then the planting must be more carefully attended to. The distance at which the sets should be placed from each other is of great importance; if the plants get plenty of air there is much less danger of disease. Only ripe tubers should be used for seed, and in harvesting all others should be rejected for the purpose. Instead of taking the small Potatos from the general crop, our market gardeners would do well to select and grow specially the tubers for seed with more care than they bestow on the main crop.

THE NEWCASTLE HORTICULTURAL SOCIETY.—In reference to the appeal of the Mayor of NEWCASTLE for subscriptions to meet the losses incurred by the Society on the occasion of its last attempted show, when a gale swept away their tents, the public have come forward in a handsome manner, and up to Saturday, September 5, money had come in to the amount of £525. It is to be hoped that the efforts of this Society in the future may be crowned with the success which it so richly deserves.

THE PEOPLE AND PRIVATE GARDENS.—Lady WOLVERTON, who has a beautiful garden attached to her residence, Coombe Warren, near Kingston, very kindly last week placed it at the disposal of a local association for the purpose of a public *fête*, or garden party. The gathering comprised several thousands of persons, young and old, and various amusements, including dancing, as well as enjoyments of a more solid nature, were indulged in to a late hour. Happily the weather, which had just previously been remarkably wet, was on that occasion very dry. We refer to this fact, because her ladyship's excellent gardener, Mr. WOODGATE, was enabled to report next morning that, practically, no harm whatever had been done to the grounds, the shrubs, or flowers. This is very pleasing, because it shows how great is the confidence those who possess beautiful private gardens may repose in what is ordinarily a well-conducted mass of respectable people. So charming a garden as that of Mr. BERTRAM CURRIE, near by, was employed for a similar purpose last year, and with similar results. It is very pleasant to be able to refer to cases of this kind, which may easily be largely multiplied if desired, as they show how

greatly the public appreciate privileges of this description. Would that we could find many of the beautiful gardens of the country thus freely thrown open to a public, too largely, except in favoured

the year, on payment of a small fee. That some gardens have been so utilised, does but show that there are hundreds which might help if equally utilised; for everywhere experience shows that the public know how to appreciate the privileges they thus are permitted to enjoy.

SOUTH KENSINGTON AND AGRICULTURAL CLASSES.—It has been decided by the Science and Art Department, South Kensington, to inaugurate a series of science classes dealing with agricultural subjects in rural districts during the autumn and winter. Such classes would receive not only the grant, but also such grants as the County Councils may see fit to award. Prize-money will be given to those who pass the examination with a first class to the extent of £2, and to those who pass in the second class the prize will be £1. The department is endeavouring to stimulate interest in these subjects, on the part of local schoolmasters.

THE SALE OF PLANTS AT MILLBANK, EDINBURGH.—The celebrated collection of plants at Millbank was sold by auction on the 10th inst., by Mr. DAVID MITCHELL, 6, Comely Bank, Edinburgh. The occasion of the Caledonian Show brought a large company to witness the dispersion of the splendid *Ericas*, greenhouse *Rhododendrons*, *Azaleas*, &c. Buyers were not numerous, yet the prices obtained were fairly good. Specimen *Azaleas* brought from 3 to 5 guineas, *Ericas* from 3 to 7 guineas, *Palms* from 50s. to 63s. *Orchids* generally went cheap, but a specimen *Masdevallia Walkeriana*, about 2½ feet across, brought 19 guineas.

THE GREAT INTERNATIONAL SHOW AT EDINBURGH.—We have received various protests against the manner in which some of the southern exhibitors in the non-competing classes were treated at Edinburgh. The complainants are under the impression that their exhibits, which did much for the success of the show, were unfairly ignored. The truth, we believe, is that the Council has not yet decided upon the nature of the awards to be made, and it is probable some time will elapse before a decision is arrived at. This delay is unfortunate, but we are loath to believe that it implies any want of recognition on the part of Caledonians of the efforts of their southern brethren. Other complaints relate to the removal of exhibits and to the consequent confusion, but when the gigantic proportions of the Show, and the necessity of absolutely vacating the building in time for the Saturday market, are considered, much allowance must be made for the officials.

CYPRIPEDIUM MACROCHILUM,

n. gr. hyb. (LONGIFOLIUM ♀ LINDENII ♂).

This new production of Messrs. J. Veitch & Sons, and which was awarded a First-class Certificate at the Royal Horticultural Society, on August 11 this year, is one of the most extraordinary which the skill of the hybridiser has yet produced. Using the pollen of the practically pouchless *C. (Uropedium) Lindenii* on *C. longifolium*, the unexpected result in the progeny of an extraordinarily large and elongated labellum or pouch, as seen in the illustration (fig. 40), was produced. The plant has the usual bright green leaves of the *Selenipedium* section of *Cypridium*, and the one from which the illustration was taken had a four-flowered scape. The upper sepal is creamy-white, slightly tinged with green, and having greenish lines thereon, the lower sepals are similar to the upper. The petals, which resemble those of *C. caudatum*, have purple hairs at the base; they are greenish-white, tinged and streaked with rose-colour and deepening in hue towards the tips. The staminate node has a fringe of purple hairs, and the labellum which forms the striking feature in the flower is ivory-white, tinged in places with pale green, and the veinings coloured, and between them tinged with reddish-brown. The labellum is curved forward, and its unfolded lobes are white, beautifully spotted with rose. In delicacy of beauty, if not in stature,

FIG. 40.—CYPRIPEDIUM MACROCHILUM X REDUCED.

localities, denied good garden privileges. What a considerable addition to the Gardeners' Orphan Fund could be made were many of our beautiful private gardens thrown open, if but for a few days in

it takes rank above even its ally, the stately and favourite *C. grande* × (*C. longifolium* var. × *C. caudatum*), *J. O'B.*

HOME CORRESPONDENCE.

NEW PLANTS.—Amongst interesting new plants I have recently heard of, are a pure ivory-white-flowered tall and vigorous-growing *Kniphofia* from the Drakensberg Mountains, in South Africa; and a yellow-flowered *Pancratium maritimum* from Algiers, and the latter I hope to bloom shortly, when I shall have more to say about it. *W. E. Gumbleton.*

JUDGING OF POTATOS AT EXHIBITIONS.—Being an exhibitor at the Edinburgh International Show, and not knowing the true types of Potatoes, and the points they should be judged upon, I shall feel greatly obliged if any qualified judge will inform me, through your columns, what special points of merit a Potato should possess to fit it for the exhibition table. It was remarked, by some men capable of knowing, that the best exhibits of Potatoes lost the awards at the International Show at Edinburgh. I should also like to be informed how many types of Potatoes there are? *One Who Wishes to Learn.*

WHAT IS A HARDY PLANT?—It is very hard upon judges at flower shows when they are called upon to interpret some imperfectly worded and perhaps misleading class in a schedule. It is equally hard upon a horticultural show committee when judges, either wilfully or stupidly, misinterpret the obvious meaning of a class as given in the schedule. Take the case referred to by "E. W.," at Bridgewater. There the committee, in leaving the wording so literally as "hardy perennial and bulbous plants," are careful to admit of a liberal and wide interpretation. The judges limit that interpretation in a singularly restricted sense. What is *Hydrangea paniculata* but a hardy plant? It has proved itself to be so almost everywhere. It passes through our severest winters unscathed [?], and comes up and blooms superbly every autumn. What is it but a herbaceous perennial, just as a herbaceous *Phlox* is? Really, there is absolutely no distinction between them in hardiness and habit, except that the growths of the *Hydrangea* are rather more woody or hard than are those of the *Phlox*. The same may be said of the growths of a *Polygonum*, or of many other herbaceous plants, which some class as shrubs, but really are not shrubs, because the growths disappear in the winter. If *Roses*, and all ordinary hard-wooded shrubs, which are not herbaceous, but are perennial, are excluded from classes termed hardy perennials, it can only be by some general understanding, because "hardy perennial" is a term which includes every hardy thing which grows. If a footnote were added "excluding *Roses*, shrubs, and trees," then it would be pretty well understood that any hardy plant not found in either of those three sections could be admitted. Still, there is the point to be determined, are hard-wooded plants of annual growth from the roots in the ordinary acceptance of the term "hardy herbaceous perennials," or "hardy herbaceous shrubs?" I say, they are of the former section. *A. D.*

WATERLOO STRAWBERRY.—I was glad to see your correspondent Mr. Divers speak well of the Waterloo Strawberry, and I can confirm his remark that it has cropped better this year than formerly, although with me it always crops well; and I consider it has the finest flavour, and that it is the best variety I have grown. It may not be a market fruit, being too dark in colour, the colour of the pulp being deep crimson; but it is sugary, and the fruit ripens well up to the point. It has not the fine flavour of Filbert Pine, British Queen, and Dr. Hogg, nor the robustness of Noble—but Noble is the coarsest, most flavourless Strawberry that I know of, and for my table it is not worth growing. Waterloo maintains the high reputation given to it when sent out by Messrs. J. Veitch & Sons, Chelsea. *J. Pope, Northfield, Birmingham.*

DOES IT PAY TO CROW APPLES?—I was pleased to read the remarks by "S. H." at p. 274 of the *Gardeners' Chronicle*, although they are rather hard upon me, but that is a small matter if we can add anything to the knowledge we already possess. I would like to say, that I had not the least intention of making invidious comparisons between any class of men, and do not wish to be misunderstood in this. I am thankful to say that my lot has always been

cast where I could order a suit of clothes to be made; nor did I ever contemplate a district where there were no tailors. It is not of much consequence, but I have found that men following sedentary occupations like tailors and shoemakers, are more fond of their gardens than farm labourers who have to work hard in the fields all day, and are often too tired to do anything at night. Gardening is a rest to the other class of men. I quite admit that the four-tined fork is a superior implement to the more clumsy spade. We use up four forks to one spade for digging in our garden. I gave the prices paid for steam cultivating at Loxford Hall some ten years ago, and the same price was paid on a neighbouring farm last year; but as I was quoting from memory, I wrote to Mr. C. H. Binney, of Ilford, who contracts for such work, and quote his letter *in extenso*:—

"Dear Sir,—I am in receipt of yours in reference to steam cultivation in the preparation of the land for fruit growing. There is no doubt that it is very beneficial. A few years ago, my engines were employed upon a large farm at Cheshunt, and previously to that at Enfield, doing just what you say; and where it was necessary to go through the land once, 15s. per acre, as the price for hire of the tackle, would be about right; but if the land needed that the cultivator should go through it a second time, it would be 22s. to 24s., according to the character of the land. Heavy land, never having been steam-cultivated, would cost 24s. per acre for hire of engines only; but at double this, the work would pay the grower, and be cheaper than spade husbandry."

The above is Mr. Binney's letter, and he has a large experience in steam cultivation. As to the prices of the fruit, I gave exactly the prices received from the salesman in the Borough Market. I wish some other growers would record the result of their experience in fruit growing, and failures would be as useful as successes. *J. Douglas.*

LATE BROCCOLI, VEITCH'S MODEL.—I am at one with Mr. Wythes, as to the excellence and bardiness of this variety; here, on a cold heavy clayey loam, it grows rampantly, and not planted too thickly, it withstood the severity of the past winter, where others failed. As late as June 27 this year we cut some nice heads of this variety. *G. Ward, Brant Broughton, Newark.*

EXOTIC FRUITS AT EDINBURGH SHOW.—The display at the exhibition in Edinburgh must have generally realised expectations. The fruits, with one exception, consisted solely of the ordinary fruits grown, the exception being *Passiflora edulis*. Are there no other *Passifloras*, for instance, grown with edible fruit? Besides this fruit, there are Cape Gooseberries, Guavas, *Monstera delicosa*, and various others which are surely worth having some attention given to them, and encouragement shown to the growers. *W. M.*

POTT'S SEEDLING AND LORD GROSVENOR APPLES.—In reply to "X.," respecting these varieties, I have grown Pott's Seedling in these gardens for the past fifteen years, and have never known this variety to fail bearing a heavy crop of fruit annually during that time, no matter what the season has been. It bears fruit the year after planting, is a very free grower, quite free from canker, and the blossoms escape frosts. The same can be said of Lord Grosvenor. I have planted and grown this variety during the past twelve years; it is a codlin of good size, not quite so large as Lord Suffield, being a very free grower, and wonderfully productive. I have used this variety largely to replace Lord Suffield, which kind I have nearly abandoned, on account of its liability to canker, the branches of the trees dying away from this cause till they become so unsightly as to render it absolutely necessary to uproot and replace them with others. The above two varieties can either be grown as standards or bushes, with a certainty as to their fruitfulness. Added to these, Ecklinville Seedling and Stirling Castle—these four, in my opinion and experience, constitute the cream of the early culinary varieties, for the large size of their fruits, earliness, and great productiveness, either for private use or market purposes. *Edward Ward, Hewell Gardens, Bromsgrove.*

POTT'S SEEDLING APPLE.—In reply to "X.," on p. 286, as to Pott's Seedling Apple, I have found it to be an excellent cropping Apple, and of good quality, keeping with me well into January. I have here an old tree that has not failed a crop for many years; it does not appear to grow to a large tree, but is quite free from canker. I have some young trees,

planted two years since, also carrying good crops having had a few good fruit on last year. The Jolly Beggar I cannot speak of from experience, but Dr. Hogg, in his *Fruit Manual*, speaks of it as a certain cropper. The soil here is a sandy loam on gravel. *J. Howard, Benham Gardens.*

RAINFALL IN WILTS.—The rainfall of August, 1891, exceeds in this part that for any month since 1871. In the past month, 8.19 inches fell on twenty-three days, the greatest fall being on the 20th, viz., 1.20 inches. The previous greatest rainfall in any month, of which I have a record, was in October, 1875, when the total was 7.66 inches; and the next was in August, 1879, when the rainfall amounted to 6.81 inches. Much farm and garden produce has suffered; and, if the weather does not soon change, there must be very serious results. Already all varieties of Potatoes are going off rapidly with the rot; fruit is cracking and falling, notably Plums, Apricots, Gooseberries, and Cherries; and Wheat in the ear has started to grow; Hay is lying upon the ground spoiled. Turning to the decorative part of the garden, we find scarcely a flower in beds and borders. All the finer and more sun-loving flowers are spoiled, and those that survive are badly blown about. Fine foliage plants are spoiled entirely, through gales and storms we have experienced in this part of the country. Thunder and lightning occurred nearly daily, and the old inhabitants say they do not remember to have noticed so much before. If the rain does not soon cease, we shall feel it next year as well as now. *W. A. Cook, Compton Bassett Gardens, Calne.* [Publication delayed.]

[PASSIFLORA CONSTANCE ELLIOT.]—In the gardens at Chaddlewood, South Devon, there was a large specimen of this plant, growing against a north wall, which last year bore hundreds of white flowers. But the winter proved to be more than it could stand, and it was cut back to the main stem, within a few feet of the ground. This wall, although facing north, is sheltered from north winds by a plantation of Fir trees, some yards distant. The blue variety, *P. cœrulea*, growing alongside of it on the same wall, was also cut, but not to the same extent. They are both shooting again, but it will be some time before they cover the same space they did before. I infer that *P. Constance Elliot* is not quite hardy, and that *P. cœrulea* is much the hardier of the two. There were also two *Constance Elliot* replanted in the autumn, but one was killed outright, and the other to ground-level, but is shooting again from the bottom. I should also add that the thermometer on one occasion stood as low as 10°, or 22° of frost. *H. Grillage.*

POTATO DISEASE.—Having tried the comparative merits of high moulding and the sulphate of copper remedy, we think the results may be interesting to others. We selected a nearly square piece of ground, planting ten varieties in parallel rows right across the piece. Stable manure was employed, and a fair dose of lime; and the soil, a good loam, is situated above a clay subsoil. The varieties planted were mostly new, or of recent introduction, being such as The Dean, Village Blacksmith, The Gentleman, The Amateur, The Cottager, The Bruce, a new American variety named Pride of the West, and two new varieties to be sent out by us next season, Prodigious and The Bishop. A space of 8 feet at each end of the drills and across the piece was measured off, and on one of these spaces high moulding was tried; on the other, the salts of copper mixture; and the middle portion left alone. On digging the piece last week, the results were striking and convincing. That portion treated with salts of copper showed a very much heavier yield of sound tubers, because, with the exception of the Dean and the Village Blacksmith, none of those so treated were diseased more than to about 1 or 2 per cent. The end of the rows treated on the high-moulding method was diseased to the extent of 10 to 15 per cent., while the larger and middle portion suffered a good deal, the disease reaching quite 30 per cent. in the case of the Dean and the Village Blacksmith, and in the other sorts the percentage of diseased tubers varied from 10 to 20. The net result of our experiment was, in round figures, that the relative proportion of sound tubers lifted from the piece right across, was—for the salts of copper treatment as 6, for the high-moulding method as 4, for the "trust to Providence" theory as 3. What struck us, however, as especially noteworthy in the experiment, was the fact that the piece treated with the mixture grew stronger and more vigorous haulm; the stalks remaining longer green, even, in some

cases, up to the time of digging, and apart from the question of disease, yield a much heavier crop. In short, the mixture, as well as being of remedial value, acted as a fertiliser and stimulant, by keeping the plant in a healthy and growing state. In applying the stuff, the varieties with rough foliage seemed a little burned after its application, the smooth-leaved sorts suffering no ill-effects. The mixture we used was that recommended by M. Prillieux, and given in the *Gardeners' Chronicle* of July 4 last, namely, 3 lb. of sulphate of copper, 1 lb. of quicklime, 20 gallons of water, applied at the rate of 140 to 150 gallons per acre. As the disease did not show itself early amongst our Potatoes, we did not apply the mixture until July 24, and only gave them one dose. The cost of the mixture would be about 5s. per acre. *Robert Veitch & Son, Exeter, September 14.*

HARDINESS OF HYACINTHUS CANDICANS — I see in last week's issue, Mr. Earley asks the question as to the hardiness of *Hyacinthus candicans*. I planted some here four years ago, and they have flowered well every year; and last winter they had no protection at all, which proves it to be a very valuable hardy plant. Last autumn I also planted fifty more bulbs, 6 inches deep in the soil, and covered them, when done, with about 4 inches of coal ashes, and these all came up, and flowered well. *H. Hatch.*

— In answer to William Earley's questions as to the hardiness of *Hyacinthus candicans*, I am happy to inform him mine have stood out in a bed of *Hellebores* sloping towards the north for five years without any protection. They have never been lifted, and are now in flower, consequently may be considered as perfectly hardy. *The Hon. Mrs. Hope, Belmont, Murrayfield.*

THE VARIEGATED ENGLISH ELM.—There is a large specimen of the above growing in the shrubberies attached to the pleasure and flower gardens here, it being the only one we have. I have watched it very closely during the past fifteen years, and from the very slow growth it makes, I should judge it cannot be less than about one hundred years old. A wet season affects the variegation very much, it being much more effective in a dry summer. From my experience of the tree, it is not a variety that I should care to plant largely for effectiveness, at least, not in this district. *Edward Ward, Hewell Gardens, Bromsgrove.*

— Forty or more years ago, there was growing just outside the Foxfield Gate, on the Amphill road, on the right hand side, a very handsome plant of the above tree, and at that time I should say it must have been 30 feet high, and a perfect pyramid, with variegation from the lowest to the highest twig, and I recollect that it was on a high bank close to the road, which would account for its very fine variegation (see Mr. J. Perkins, *Gardeners' Chronicle*, p. 284, September 5). Should any of my old colleagues be still in the land of the living, they may be able to give a better account of this handsome plant than I can at this distance of time. Mr. Forbes was head gardener at Woburn Abbey, Mr. George Dodds was foreman of the pleasure grounds, and Mr. Simpson was in the kitchen garden; the apprentices that I can recollect were—Thomas Cannon, James Wood, Charles Hume, Charles de Fraim. Visitors to the kitchen garden at Woburn Abbey will, I am informed, still find this Elm flourishing on the spot I have indicated. *Henry Davies.*

— With reference to the interesting article in recent issues relating to the variegated Elm at Ealing, I would remark, that a very fine specimen exists in the garden of Henry Knox, Esq., Sonning Grove. Mr. Knox informs me, that it is as near as possible 11 feet round at a foot from the ground. I can myself testify to its being a very fine tree, and the first one of the kind I ever saw. The circumference of the Ealing tree does not appear to be recorded. *John Colebrook.*

— Mr. R. Dean does well in calling attention to this handsome and highly ornamental variety of the English Elm—*Ulmus campestris albo-variegata*. The Elm, in its old age, is nearly always stately, but this variety has a beauty of its own. One of the finest specimens I have seen in the west of England is on the estate of Mrs. Grant, of Hilliersdon, near Cullompton. The tree must be pretty old, though in robust health, for it is over 70 feet high; while another specimen, planted about twenty years ago, hard by it, is 40 feet high. This Devonshire specimen stands amongst other fine timber. I think

it is a pity that variegated Elm is not oftener met with, for it certainly is a highly ornamental tree. *A. Hope, Exeter.*

SCOTLAND.

EDINBURGH CONFERENCE ON FRUIT GROWING.

IN connection with the International Fruit and Flower Show of the Royal Caledonian Horticultural Society, the British Fruit Growers' Association held a conference on fruit-growing in the Waterloo Hotel, Edinburgh, on the 10th inst. Councillor Colston, Edinburgh, presided; and in opening the proceedings, he explained that the objects of the Association were to promote the profitable culture of fruit in Great Britain and Ireland; to facilitate the distribution of fruit to the consumer, and to disseminate practical information on the subject of fruit-growing.

Mr. George Gordon, Vice-Chairman of the Association, gave a communication on "The Present Condition and Prospects of Fruit-Growing for Profit." At no time, he said, had fruit-growing been carried on so successfully as at present, yet there was room for much improvement. Those acquainted with the midland and western counties of England were well aware, that notwithstanding the favourable conditions for fruit-growing which existed in those counties, there were tens of thousands of acres of orchards which did not pay because of long-continued bad management. From the same cause, and also the erroneous idea that fruit-growing would not pay, the formerly magnificent orchards of the Carse of Gowrie had almost disappeared.

Observations made in Ireland last year led him to the conclusion that fruit growing there was in a discreditable condition. In Ulster, thousands of acres were occupied with orchards planted sixty or seventy years ago, the produce of which generally was unfit for market. The owners appeared to hold the opinion that the orchards would not pay for good cultivation. The speaker's opinion was, however, that the unprofitableness was not the cause, but the consequence of neglect. In orchards in the same district, in which good management was practised, crops of the highest excellence were found, the produce of which realised good prices in the market, a sufficient proof that neither the soil or the climate were at fault. Well-managed trees yielded good results, and it was the endeavour of the British Fruit Growers' Association to enforce this fact.

Mr. Malcolm Dunn, Dalkeith, took exception in some degree to the statement of Mr. Gordon, that the orchards had almost disappeared from the Carse of Gowrie. He admitted that the magnificent fruit formerly produced in those orchards had to a large extent disappeared, but there were still to be met with examples of superior culture, which always brought good results. He could not advise anyone to go in for fruit culture without the necessary training; at the same time, he thought the difficulties of our climate were exaggerated.

Mr. Cannell, Swanley, Kent, said it seemed to him them gardeners made more of the difficulties of fruit-growing than was warranted. Proper breaking up of the ground, suitable varieties, proper planting and staking, manuring from the surface, and pruning, then really the thing went on almost of itself. He thus got big Apples and big Plums, and they sold well.

Mr. Hugh Dickson, Belmont, Belfast, said that he had taken an interest in fruit-growing in the north of Ireland, and he had been surprised to find how much attention was paid by farmers to fruit culture. They seemed to be well-up in a knowledge of the new varieties. The weakness of their system was that they did not classify their Apples in sending them to market.

Mr. Sinclair, market gardener, East Linton, read a practical paper on "Strawberry Culture." Firm clayey soil, well drained, he considered the best for

Strawberries, and trap-rock the best foundation for such a soil. In order to have fruit in the market early, it was necessary to plant in the sunniest aspect; but otherwise it was not desirable to have a full southern exposure. He preferred preparing his runners in autumn and planting in March, to planting at any other season of the year. As regards varieties, he considered that the fewer a market gardener grew the better. Vicomtesse Iléricart de Thury and Duke of Edinburgh, he considered the two best varieties for market purposes in Scotland. It did not pay to grow such late varieties as Elton Pine, as they had to compete with Green Gage Plums and other fruits. After eighteen years' experience in artificial irrigation, he considered that it paid, even at heavy cost, if done thoroughly when necessary. His practice was to give a thorough soaking once a week, and he had spent as much as £13 per week on watering his Strawberry crops. Speaking on the subject of markets, he thought the time was near when the greater number of growers would confine themselves to the supply of the jam manufacturers. He spoke of the unfair competition which market gardeners were exposed to, in so far as nearly every landed proprietor now sent the produce of his garden into the market. He did not object to that, but did complain that he should have to pay more taxes on 23 acres of land than were paid on any nobleman's establishment in the county.

Mr. J. Cheal, Crawley, read a paper on "Gathering and Packing, and Storing Fruit," in which he advocated greater care in gathering, sorting, and packing of fruit for market; described various facilities for packing and storing, and the management of late fruits in the storing-rooms.

Mr. Alex. Milne, Edinburgh, moved a vote of thanks to the Association, and the proceedings terminated with a similar compliment to the Chairman.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 3.—A meeting of the Fruit and Vegetable Committee was held at Chiswick on the above date. Present: Dr. Hogg, F.L.S., in the chair; and Messrs. Wright, Pearson, Saltmarsh, Dean, Denning, Willard, Norman, and Cummins. The committee examined the collections of Potatoes, Turnips, Runner Beans, and Tomatoes growing in the gardens.

Potatoes.—The crop in general was found to be inferior, the tubers large and coarse, and most of the varieties greatly diseased. The following sorts were selected by the committee for appearance, cropping, &c., and then cooked:—Malshanger Kidney (Knelner), Radclyffe Kidney (Selby), The Gentleman (Veitch), Lord Salisbury (Wiles), The Times (Ross), Ellington's Prolific (Ellington), Seedling (Studd), Mottled Beauty (Wiles), Market Favorite (Ellington), Crawley Prizetaker (Cheal), Renown (Nye), Mottled Beauty, Ellington's Prolific, and Crawley Prizetaker receiving three marks (x x x) each.

Turnips.—Of these, forty-eight lots were grown, the following receiving x x x:—The Early Milan (Veitch, Benary, Harrison), the Early White Strap-leaf American Stone (Vilmorin), the Large White Globe Purple-Top (Vilmorin), the Large Green Globe (Vilmorin), and Early Snow Ball (Veitch).

Scarlet and other Runner Beans.—Forty-four lots. These were found to be scarcely in condition for examination, with few exceptions. A First-class Certificate was awarded to Sutton's Tender and True—a Runner Bean of the dwarf kidney section, with fine, long, straight pods.

Tomatoes.—Of these 117 lots were grown under glass, the following receiving x x x:—Golden Sunrise (Veitch, Barr, Daniels), Golden Nugget (Sutton), Italian Wonder (Hooper).

Committee Awards.

Meeting at the Drill Hall, Tuesday, September 2.

FLORAL COMMITTEE.

Awards of Merit.

To *Gladiolus* Sir Arthur Sullivan, Sheila, W. S. Gilbert, George Meredith, and Lady Brooke, from Messrs. Kelway & Sons.
To *Dahlia* Arthur Rawlings, William Powell, and Mrs. Keith, from Mr. West.
To *Dahlia* Claxton's Harlequin, from Messrs. Paul & Son.

To Croton Golden King, from Mr. H. B. May.
To Athyrium f.-f. superbum densum and f.-f. revolveas, from C. T. Drury, Esq., F.L.S.
To Scolopendrium vulgare muricatum superbum and v. m. crispum, from E. J. Lowe, Esq., F.R.S.
To Aspidium angulare grandiceps coronale, A. a. setosum gracile, A. a. plumoso-divisilobum gracile, and A. aculeatum cristatum adnata, from E. J. Lowe, Esq.
To Asplenium ceterach var. multifolia-cristata, from E. J. Lowe, Esq.

First-class Certificate.

To Athyrium f.-f. plumosum Druryi, from C. T. Drury, Esq.
To Scolopendrium vulgare crispum decorum, from E. J. Lowe, Esq.
To Scolopendrium supralineatum Moona, from E. J. Lowe, Esq.
To Scolopendrium rameo-inequale laudabile, from E. J. Lowe, Esq.
To Asplenium f.-f. lunulatum Neilliae, from E. J. Lowe, Esq.
To Aspidium angulare grandiceps taeda, from E. J. Lowe, Esq.
To Aspidium a. cruciatum Nympha, from E. J. Lowe, Esq.
To Aculeatum cristatum hybridum, from E. J. Lowe, Esq.
To Nephrodium palacaeum Willsii, from E. J. Lowe, Esq.
To Osmunda regalis capitata, from E. J. Lowe, Esq.

Botanical Certificates.

To Picea Omorika and Davallia assamica, from Messrs. Veitch & Sons.
To Scolopendrium vulgare periferens var. Nepenthesoides, from E. J. Lowe, Esq.
To Aspidium aculeatum cristatum circumglobatum, from E. J. Lowe, Esq.

Commended.

To Strain of Quilled Asters, from J. Walker.

Medals.

Silver Flora.

To Messrs. Kelway & Son, for group of Gladioli.
To Mr. G. Phippen, for group of Dahlias.
To Mr. G. Phippen, for group of Lilies, &c.
To Mr. E. J. Lowe, for group of Ferns.

Bronze Banksian.

To Messrs. J. Veitch & Sons, for group of hardy plants.
To C. G. Van Tubergen, for group of Gladioli.

FRUIT COMMITTEE.

Silver Banksian Medal.

To Messrs. J. Veitch & Sons, Royal Exotic Nurseries, for collection of Plums.

Award of Merit.

To Melon Halstead Favourite, from Alfred Gibson, gr. to T. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, Kent.

ORCHID COMMITTEE AWARDS.

First-class Certificate.

To Miltonia Blunthi var. Lubbersiana, from Baron Schroder (gr., Mr. Ballantine).

Cultural Commendation.

To Angraecum articulatum, from C. J. Lucas, Esq. (gr., Mr. Hasham).

Botanical Certificate.

To Cattleya granulosa var. Djanceana, from Messrs. Sander & Co.
To Mormodes fimbriatum var. aurea, from Messrs. Hugh Low & Co.
To Catasetum fimbriatum, from Mr. G. Parrot, gr. to W. Wright, Esq., Denmark Hill.
To Catasetum fimbriatum, from Hugh Low & Co., Clapton.

CRYSTAL PALACE.

GREAT EXHIBITION OF FRUIT, September 4 and 5.

—Judges: Messrs. A. F. Barron, Smith, Wythes, Earley, Coomber, Hudson, Ford, Dean, Willard, Laing, Whalley, and Wynne.

Fruit (open classes).—Collection of fruit, two competitors—1st, Earl of Haddington, Elvaston Castle, Derby (gr., Mr. J. H. Goodacre); this lot consisted of Black Hamburg, Muscat of Alexandria, Barbarossa, and White Tokay Grapes, Violette Hative and Rivers' Orange Nectarines, Noblesse and Bellegarde Peaches, Kirke's and Golden Drop Plums, Queen and Cayenne Pines, Victory of Bath and Conqueror of Europe Melons, Worcester Pearmain Apple, &c., all in good condition; 2nd, Earl of Radnor, Longford Castle, Salisbury (gr., Mr. H. W. Ward), who showed handsome Sea Eagle and Prince of Wales Peaches, St. Michael's Orange, Vicomtesse Hélicart de Thury Strawberries, &c.

Collection of twelve dishes of fruit, two competitors, 1st, J. H. Rolls, Esq., The Hendre, Monmouth (gr., Mr. Thomas Comber), a nice lot, consisting of Gros Maroc and Muscat of Alexandria Grapes, Pine-apple Nectarine, Bellegarde Peach, Kirke's Plum, &c.; 2nd, Earl of Radnor, Longford Castle (gr., Mr. H. W. Ward), with Trebbiano and Gros Guillaume Grapes, Duchess of Oldenburgh Apple, Brown Turkey Figs, &c.

Collection of eight distinct dishes of fruit (four competitors)—1st, Mrs. McIntosh, Havering Park, Romford, Essex (gr., Mr. A. Ocock), with Black Hamburg and Muscat of Alexandria Grapes, Noblesse Peach, Havering Park Melon, Pittmaston Orange Nectarine, Red Astrachan Apple, Williams' Bon Chrétien Pear, Brown Turkey Fig; 2nd, Duke of Beaufort, Badminton, Chippenham (gr., Mr. W. Nash), who had good Black Alicante and Muscat of

Alexandria Grapes, large Barrington Peaches, nice dish of Beauty of Bath Apple, &c.

For a collection of ten kinds of Grapes, W. C. Watson, Esq., Clarendon Park, Salisbury (gr., Mr. C. Warden), was awarded 1st prize for the only lot shown; he had good Gros Maroc, Black Alicante, Buckland Sweetwater, &c.

Two competitors for a collection of five kinds of Grapes: 1st, Mr. George Reynolds, Gunnersbury Park, Acton, with fine bunches of Gros Maroc, Muscat of Alexandria, Chasselas Napoleon, Black Hamburg, and Alicante; 2nd, Mr. Thomas Osman, Outershaw Park, Chertsey, Surrey, having beautiful Lady Downes, Alicante, Mrs. Pearson, &c.

For best three bunches of Black Hamburg Grapes, there were ten competitors. Earl Cowley, Draycott House, Chippenham, Wilts (gr., Mr. J. Gibson), was an easy 1st.

Six exhibits of three bunches of Muscat of Alexandria Grapes, Sir Charles Phillips, Bart., Picton Castle, Haverfordwest (gr., Mr. J. Dumble), being 1st, with large bunches of handsome berries; Mr. George Reynolds, Gunnersbury Park, being a good 2nd. The latter was also 1st, among four competitors, for best three bunches of Gros Maroc Grapes; Hon. W. P. Talbot, Glenhurst Park, Esher (gr., Mr. C. J. Waite), coming 2nd. For best three bunches of Madresfield Court Grape, there were six exhibits, Earl Cowley, Draycott House (gr., Mr. J. Gibson), coming 1st.

Among seven competitors for best three bunches of Alicante, Mr. W. Marsh, 9, Henrietta Villas, Bath, was 1st, with beautiful rich black bunches; Henry Tate, Esq., Park Hill, Streatham Common (gr., Mr. W. Howe), being 2nd, with large bunches, but not so well coloured. The prize for three bunches of any other white Grape went to W. C. Watson, Esq., Clarendon Park, Salisbury, for Buckland Sweetwater. Six competed. The prize for three bunches of any other black Grape was awarded to Earl of Radnor, Longford Castle (gr., Mr. H. W. Ward), for very large bunches of Mrs. Pince's Black Muscat; Mr. George Reynolds, Gunnersbury Park, was a good 2nd, with well-coloured Alwick Seedling.

Four dishes of distinct Peaches, three competitors—1st, Earl of Cork, Marston House, Frome (gr., Mr. W. Iggulden), showed Sea Eagle, Walburton Admirable, Barrington and Crimson Galande, of fine size and colour; 2nd, J. T. Hopwood, Esq., Ketton Hall, Stamford (gr., Mr. W. H. Divers), with Bellegarde, Crawford's Early, Prince of Wales, Grosse Mignonne, also very good. The latter exhibitor was 1st in Class 16, four dishes of Nectarines, consisting of Pine-apple, Lord Napier, Victoria, Rivers' Orange; Mr. J. McIntosh, gr., Hutton Hall, Guisborough, being 2nd, with Pine-apple, Humboldt, Darwin, and Spencer, four competed.

For best single dish of Peaches, thirteen entered, A. Willis, Esq., Lovell House, Crawley, Sussex (gr., Mr. W. Lawson), taking 1st with Grosse Mignonne; Earl Radnor (gr., Mr. H. W. Ward), being 2nd with Sea Eagle.

Seven entered with one dish of Nectarines, J. T. Hopwood, Esq. (gr., Mr. W. H. Divers), being 1st, with beautiful Lord Napier Nectarines. He was also 1st, with collection of six dishes of Peaches, and six dishes of Nectarines—two competed.

Twenty-four competitors exhibited green-fleshed Melons, the best-flavoured being a finely-netted variety, Halstead Favourite, shown by T. F. B. Atkins, Esq., Halstead Place, Sevenoaks (gr., Mr. A. Gibson); the 2nd prize went to Earl of Harrington, Elvaston Castle, Derby (gr., Mr. J. H. Goodacre), for a smooth-skin variety.

Twenty scarlet-flesh Melons were exhibited; the best was Sutton's Triumph, exhibited by Mr. W. Palmer, Kingston-on-Thames; the 2nd being Blenheim Orange, from W. Stride, Esq., Coulsam Grange, Caterham, Surrey (gr., Mr. J. Mathews).

Four dishes red Plums, eleven entered.—1st, Viscount Falmouth, Mereworth Hall, Maidstone (gr., H. Markham), with Victoria, Goliath, Prince of Wales, Sultan—beautiful fruits; 2nd, Earl of Cork, Marston House (gr., Mr. W. Iggulden), with Victoria, Prince of Wales, Angelina Burdett, and Pond's Seedling. The latter was 1st, among eleven competitors, with four dishes of yellow Plums, consisting of Oullin's Golden Gage, Golden Esperen, Transparent Gage, and Jefferson; 2nd, Mr. J. Neighbour, Bickley, Chislehurst, with Jefferson, Magnum Bonum, Pershore, and Green Gage.

Four dishes purple Plums, ten competitors.—1st, Earl Amburst, Montreal, Sevenoaks (gr., Mr. Alfred Bolton), with Prince Englebert, Prince of Wales, Dymond, and Kirke's; 2nd, Earl of Radnor (gr.,

Mr. W. H. Ward), with Kirke's, Dymond, Mitchellson, and Belgian Purple.

R. Sneyd, Esq., Keele Hall, Newcastle, Staffordshire (gr., Mr. John Wallis), was 1st, with three dishes of Figs (the only entry).

Basket of black Grapes, above 12 lb. in weight.—J. Parrott, Esq., East Barnet, Herts (gr., Mr. D. Macintosh), was 1st; W. J. Twigg, Esq., Croxsted House, West Dulwich (gr., Mr. E. Longley), was 2nd, both showing well-grown Gros Maroc; nine competed.

Three competitors showed baskets of white Grapes above 12 lb. in weight.—1st, Mr. W. Lane, King's Ride, Ascot; 2nd, W. Maw, Esq., Walk House, Barrow-on-Humber, Hull (gr., Mr. G. Winter), both with Muscat of Alexandria, in good form.

Two collections of 12 kinds of orchard-house grown Apples were staged, the 1st prize going to Messrs. George Bunyard & Co., Maidstone, Kent, who showed beautiful Lady Sudeley, Queen, Warner's King, Ribston Pippin, Peasgood's, Bismarck, Melon, Washington, Emperor Alexander, Stone's Apple, Mother, and Red Bietingheimer, all very fine.

Three collections of ten kinds of orchard-house-grown Pears were put up, Mr. J. McIntosh, Hutton Hall Gardens, Guisborough, taking 1st, with large specimens of Beurré d'Amanlis, Louise Bonne of Jersey, Brockworth Park, Souvenir du Congrès, Beurré Clairgeau, Clapp's Favourite, Van Mons, General Todleben, Pittmaston Duchess, and Doyenné du Comice; Messrs. G. Bunyard & Co., taking 2nd, with nice fruits, including rich yellow examples of Dr. Jules Guyot.

Three collections of open-air autumnal Apples were shown.—1st, Messrs. G. Bunyard & Co., with forty-three kinds, including richly-coloured Beauty of Bath, Worcester Pearmain, Cardinal, Early Strawberry; also fine Lord Grosvenor, Golden Spire, Northern Dumpling, &c. 2nd, H. L. C. Brassey, Esq., Preston Hall, Aylesford (gr., Mr. A. Waterman), with nice collection, including good Worcester Pearmain, Duchess of Oldenburgh, Cox's Pomona, Golden Spire, Queen, &c.

The only collection of open air autumnal Pears came from Messrs. George Bunyard & Co., who had twenty-eight sorts, including the new American Lawson Pear, rich crimson and yellow with fine aroma; Early Benoit, bronze-crimson; and very good Doyenné Boussoch, Durondeau, &c.

Nine collections of six distinct Tomatos were shown; 1st, Mr. R. Spinks, Florist, Horley, Surrey, who had splendid Acme, Trophy, Goldfinder, New Jersey, Dedham Favourite, and Turner's Hybrid; 2nd, Mr. Arthur Rawlings, Dahlia Nursery, Romford, with Trophy, Stamfordian, Perfection, Livingstone, Earliest of All, &c.

Flowers (open classes).—Two collections of 100 Gladioli spikes: 1st, Messrs. J. Burrell & Co., Nurserymen, Cambridge, for a nice lot of Gandavensis and Lemoine's Hybrids, among them Grand Mogul, vermilion, striped slate, large and open; Pactole, clear lemon-yellow; Pasteur, pink, striped rose; Amalthee, white, crimson eye. 2nd, Mr. W. H. Fowler, Claremont, Taunton, also very good, including Flamboyant, vermilion-scarlet; and Grand Rouge, glowing scarlet with purple eye.

Eight stands of two dozen quilled Asters.—All were good, the 1st going to Mr. John Walker, nurseryman, Thame, with bright distinct flowers; 2nd, Messrs. Saltmarsh & Son, nurserymen, Chelmsford, for neat pretty flowers. The last-named were also first among fourteen stands of twenty-four French Asters; this lot had been "dressed," making the flower incurved with an outer ray of expanded florets. The 2nd prize here went to Mr. W. F. Catlin, 9, Lower Midsummer Buildings, Bath, for some flowers with nice colours.

Three exhibits of twenty-four Hollyhock blooms.—1st, Messrs. Webb & Brand, Nurserymen, Saffron Walden, the best being Vesta, blush-pink; and Mulberry Gem, purple crimson.

Two boxes of stove and greenhouse cut flowers were staged.—1st, T. F. B. Atkins, Esq., Halstead Place (gr., Mr. A. Gibson), with tastefully-arranged lot, including four varieties of Dipladenias, also Ixora, Eucharis, Plumbago, Lapageria, &c., set up with Maidenhair.

Two lots of six Cockscombs in pots.—1st prize going to W. M. Bullivant, Esq., Homewood, Beckenham (gr., Mr. Thomas Crosswell), for dwarf compact plants; 2nd, T. Nothard, Esq., York House, Sydenham (gr., Mr. J. Slater), both lots had good combs.

Three groups of early-flowering Chrysanthemums were arranged, the 1st prize going to Messrs. Reid & Bornemann, nurserymen, Lower Sydenham, for a

large group consisting chiefly of Japanese varieties, with dwarf Pompon in the front; 2nd, Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, for a group of nice plants, covering about 80 square feet.

Cut Flowers.—Amateurs.—Three stands of eighteen Gladioli spikes: 1st, Mr. W. H. Fowler, Claremont, a choice lot, including Pollux, deep rose; Grand Rouge, vermilion; M. Brognian, bluish; Delilah, rose, &c. 2nd, Mr. E. B. Lindsell, Bearton, also very good, including Grand Rouge, Pyramidale, Celmène, Pactole, &c.

Three stands of one dozen Hollyhock blooms were staged, the 2nd prize being awarded to Mr. Thomas Hobbs, St. Mark's Road, Easton, Bristol; 1st, withheld.

Special prizes.—Given by Messrs. Sutton & Sons, for the best collection of nine kinds of vegetables (four competitors): 1st, Hon. W. P. Talbot, Glenhurst, Esher (gr., Mr. C. J. Waite); the collection consisted of Satisfaction Potato, Prizetaker Leek, Mammoth Cauliflower, Duke of Albany Pea, Lemon Rocca Onion, &c., all very well grown; 2nd, Mr. W. Palmer, Kingston-on-Thames, for a good collection, including Mammoth Cauliflower, Perfection Potato, Student Parsnip, &c. Eleven entries of Sutton's Perfection Tomato: 1st, Hon. W. P. Talbot; 2nd, Earl Cowley, Draycott House (gr., Mr. J. Gibson).

Special prizes, offered by Messrs. James Carter & Sons, for the best six fruits of Blenheim Orange Tomato, brought six competitors—1st, Mr. J. Fry, Haydon Hall, Eastcote; 2nd, Mr. Joseph Slater, Shepley House, Carshalton.

Offered by Daniels Bros., for the best fruits of Daniels' Westley Hall Melon—1st, Mr. W. Chessleburgh, Worsted House, Norwich; 2nd, withheld.

NON-COMPETITIVE EXHIBITS.

Messrs. T. Rivers & Son, Sawbridgeworth, had a fine collection of choice Peaches, Plums, Pears, &c., particularly good Monarch and Grand Duke black Plums.

Messrs. John Laing & Sons, Forest Hill, London, had a charming lot of herbaceous cut flowers, arranged with their own foliage, showing what a variety of colour can be obtained from hardy plants. A large bank of Begonias in baskets lifted from the open, interspersed with Maidenhair and Cocos Weddelliana, was brilliant. We noticed a rich lemon-yellow double Begonia Duchess of Teck as being good.

Messrs. Paul & Son, Old Nurseries, Cheshunt, besides herbaceous plants, had a collection of ornamental foliage trees, among them Shepherdia argentea, with brown shoots and silvery metallic foliage; plumose Elder, Ulmus myrtifolia purpurea, small purple leaves.

Mr. T. S. Ware, Hale Farm Nursery, Tottenham, had a large collection of Cactus, Pompon and single Dahlias, some nice dwarf plants of Tree Carnation La Neige, pure white, and a large group of seedling Begonias of most varied colours and shapes.

Messrs. Wm. Paul & Son, Waltham Cross, Herts, exhibited 150 dishes of choice Apples and Pears; specimens of the delicate pink, cup-shaped, Rose Spencer, with recurved petals, a good autumn sort; also Mme. Marie Lavalley, a Tea Rose, habit of Gloire de Dijon, with pale pink, semi-double flowers.

Messrs. Henry Cannell & Sons, Swanley, had a brilliant group of seedling double Begonias, pink, yellow, white, and other tints; the plants were raised from seed sown last January. They also had a new type of Cactus Dahlia, with twisted petals, named Robert Cannell, magenta colour. Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, had a collection of hardy Pears and Apples, also Cactus and bouquet Dahlias. Messrs. John Peed & Sons, Mitcham Road, Streatham, collection of fruit, also Apples and Pears in pots full of fruit.

First-class Certificates were awarded to T. S. Ware, Tottenham, for Begonias Challenger and Double Triumph; and to Messrs. J. Burrell & Co., Cambridge, for Gladiolus Grand Mogul.

NATIONAL DAHLIA.

SEPTEMBER 4 AND 5.

See ante, p. 312.

AMATEURS' CLASSES.

Show Dahlias.—The best twenty-four blooms, fancy varieties being also admissible, came from Mr. J. T. West, gr. to W. Keith, Esq., Cornwall, Brentwood, a very fine lot of blooms, consisting of R. T. Rawlings, H. Keith, Maud Fellowes, Duke of Fife, Mr. Saunders (fancy), Harry Turner, Clara, J. T. West, W. Rawlings, Henriette, Lord Chelmsford, William Powell (a very fine new yellow self), Mr. D. Saunders, Henry Glasscock (fancy), Willie

Garratt, Arther Rawlings (a very fine crimson self), R. T. Rawlings, Mrs. Gladstone, Miss Henshaw, Matthew Campbell (fancy), Shirley Hibberd, Frank Pearce, Glowworm, Mrs. Langtry, and Prince of Denmark. This stand was awarded the *Gardeners' Magazine* Medal for excellence of culture, the blooms being even, of good size, fresh, clean, and well-coloured. 2nd, Mr. Thomas Hobbs, Lower Easton, Bristol, whose leading flowers were J. T. West, Colonist, William Rawlings, Maud Fellowes, George Barnes (fancy), Mrs. Foreman, Prince of Denmark, Mrs. Langtry, T. S. Ware, Joseph Ashby, R. T. Rawlings, Vice-President, Mrs. Gladstone, and Mrs. Harris.

With twelve blooms, the competition confined to show Dahlias only, Mr. A. Ocock, gr. to Mrs. McIntosh, Havering Park, Romford, was 1st, with William Rawlings, Clara, Prince of Denmark, R. T. Rawlings, Maud Fellowes, Mrs. D. Saunders, Mrs. Glasscock, John Standish, Mrs. Gladstone, Majestic, George Rawlings, and Mr. G. Harris; 2nd, Mr. S. Cooper, Hamlet, Chippenham, with R. T. Rawlings, Mr. D. Saunders, Colonist, Crimson King, Mrs. Glasscock, and T. J. Saltmarsh; 3rd, Mr. Thomas Anstiss, Brill, Bucks.

There were ten stands of six blooms, Mr. J. Gilbert, Brooklands, Freshwater, Isle of Wight, who had T. J. Saltmarsh, Willie Garratt, Florence, Earl of Ravensworth, Mrs. Gladstone, and Joseph Ashby; 2nd, Mr. H. Gibbs, Ightham, Sevenoaks.

Fancy Dahlias.—Mr. J. T. West also had the best twelve blooms of fancy Dahlias, and staged excellent flowers of Professor Fawcett, Mrs. Saunders, Duchess of Albany, Rev. J. B. M. Camm, Buffalo Bill, Henry Eckford; 2nd, Mr. S. Cooper, with Duchess of Albany, Mrs. Saunders, Edmund Boston, Dorothy, Frank Pearce.

Mr. A. Ocock had the best six blooms out of nine competitors; 2nd, Mr. G. Boothroyde, with Mrs. Saunders, Rev. J. B. M. Camm, Henry Eckford, and A. F. Barron.

Cactus and Decorative Dahlias.—The best six varieties, six blooms of each, came from Mr. J. T. West, who had Beauty of Brentwood, Marchioness of Bute, Mrs. Rolfe, Mrs. Keith, new yellow and silvery-pink—very fine; Black Prince, and Mrs. Douglas. 2nd, Mr. P. Perry, gr. to J. C. Tasker, Esq., Middleton Hall, Brentwood, who had Mrs. Hawkins, Empress of India, Honoria, William Darvill, Jaurezi, and white Cactus.

There were six competitors with six varieties, three blooms of each, and Mr. H. Glasscock was awarded the 1st prize, with Black Prince, Marchioness of Bute, Robert Maher, Edmund Weekley, Harry Freeman, and Mrs. Hawkins; 2nd, Mr. E. Mawley, Rosebank, Berkhamstead, with Mrs. Hawkins, Jaurezi, Asia, &c.

Pompon Dahlias.—Mr. J. T. West had the best six bunches, ten blooms of each, but unnamed; Mr. H. Glasscock was 2nd, his best varieties being E. F. Jungker, Lady Blanche, Grace, and The Nigger. There were eight exhibitors. Mr. S. Cooper was 1st with unnamed varieties, and Mr. C. Steed, 2nd, who had Ariel, Mdlle. Faconet, H. E. Searle, and Vivid.

Single Dahlias.—The best six varieties, ten blooms of each, came from Mr. T. W. Girdlestone, who had Annie Hughes, broadly edged with rosy-pink; Gwendoline, Yellow Perfection, Demon, rich dark; Lady Helen, yellow tipped with white, small; and Bessie Halton. 2nd, Mr. H. Glasscock. The *Gardeners' Magazine* Silver Medal was awarded to Mr. T. W. Girdlestone for his 1st prize stand in this class. Mr. E. Mawley was the only exhibitor of six varieties, six blooms of each, and took the 1st prize with W. C. Harvey, Amos Perry, Miss Henshaw, Sunningdale White, Miss Roberts, and Victoria.

Messrs. J. Cheal & Sons offered special prizes for twelve varieties, in bunches of six blooms, and Mr. T. W. Girdlestone was placed 1st with Ruth, Edie Clegg, Irene, The Mikado, Evelyn, Phyllis, white, with side-edgings of yellow; Gwendoline, Hector, Dorothea, Marian Hood, Sunningdale, white; Tetta, white, with side-margins of yellow and cerise, &c. 2nd, Mr. C. Osman, who had Mrs. Barker, Victoria, Paragon, Eynsford Gem, Faust, Ainata, Evening Star, and Eclipse.

OPEN CLASSES.

The best six blooms of any dark Dahlia were those of William Rawlings, shown by Mr. C. Turner; Messrs. Keynes & Co. coming 2nd, with the same; and Mr. A. Rawlings, 3rd, with George Rawlings.

The best six blooms of a light Dahlia, and out of seven competitors, six of them staged Mrs. Gladstone; Messrs. Saltmarsh & Son were 1st, Mr. H. Gibbs was 2nd, and Mr. M. V. Seale 3rd, with this charming variety.

The best six blooms of any yellow Dahlia were those of R. T. Rawlings, shown by Mr. A. Rawlings; and Messrs. Keynes & Co. were 2nd, with the same; Mr. S. Mortimer was 3rd, with James B. Service.

The best six blooms of any tipped Dahlia were all Mrs. Saunders (fancy), yellow, tipped with white; Messrs. Saltmarsh & Son were 1st, Mr. A. Rawlings 2nd, and Messrs. Keynes & Co. were 3rd.

Messrs. Saltmarsh & Son were also 1st with six blooms of any striped Dahlia, having Frank Pearce (fancy); Messrs. Keynes & Co. were 2nd, and Mr. G. Humphries 3rd, with Mr. J. Downie (fancy).

The best six blooms of any edged Dahlia came from Mr. J. T. West, who had J. T. West, yellow, heavily tipped with purple; Mr. Seale was 2nd, with Henry Walton; and Messrs. Saltmarsh & Son, 3rd, with J. T. West.

New Dahlias were somewhat largely produced, and Certificates of Merit were awarded to the following:—

Show varieties.—John Walker, a large pure white self, of fine quality, and very constant, as Mr. Walker, the raiser, has on all occasions shown twelve or six blooms of it at one time (J. Walker); William Powell, clear yellow self, a good sized flower, of fine shape and centre (J. T. West); Arthur Rawlings, a fine deep shaded crimson self, of the finest quality (J. T. West); John Rawlings, a clear lilac self, of good quality, and a desirable shade of colour (A. Rawlings). Mr. A. Rawlings also had George Gordon, bright crimson self; Arthur Ocock, orange red self; Mrs. McLintosh, buff yellow; and Mrs. Hurst. Mr. G. Harris had Canary Bird, a large deep yellow self, fine in colour; Mr. J. T. West, Ethel Keith, a light flower in the way of Mrs. W. Slack; and Emma Cornish, deep buff yellow.

Pompon varieties.—Certificates of Merit were awarded to Messrs. Keynes and Co. for Lillian, pale ground, heavily tipped with silvery lilac pink. To Mr. C. Turner for Mars, bright pale scarlet, of good shape; and for Lorna Doone, pale ground, heavily tipped with purple.

Decorative varieties.—Certificates of Merit were awarded to Harlequin, yellow, striped with crimson (Paul & Son); Rayon d'Or, creamy white, the side margins pale orange-scarlet, very distinct (C. Turner); Mrs. Keith, yellow ground, broadly margined with delicate silvery pink, and slight lines of sulphur, very distinct and attractive (J. T. West).

Cactus Varieties.—Certificates of Merit to the following: Beauty of Arundel, dark crimson, tipped with magenta (J. Cheal & Sons); Baron Schroder, rich bright crimson, tipped and flushed with purple-magenta, extra fine (Keynes & Co.); Kyriereth, very bright pale scarlet (Keynes & Co.); and St. Catherine, yellow, with cerise-brown on the edges of the basal petals (Keynes & Co.); Ernest Cannell, very pale orange-scarlet; and Robert Cannell, rosy-crimson, tipped with bright pale magenta—both from Messrs. H. Cannell & Sons, nurserymen, Swanley.

Mr. Geo. Phippen, nurseryman, Reading, staged a number of shields of Dahlias, set up with Ferns and other plants; and Mr. E. F. Such, nurseryman, Maidenhead, had a collection of bunches of hardy flowers, &c.

KINGSWOOD AND WEST GLOUCESTERSHIRE HORTICULTURAL.

August 25.—It is nineteen years since a flower show was held in this thickly-populated district. But during that period the plant-loving residents among the working classes have kept alive their capabilities to cultivate, for the cottagers' tent proved a perfect surprise; good-sized and admirably grown Cissus discolor, Caladiums, the variegated Pineapple, Adiantum Farleyense, Begonias of the Rex type, and Ferns of many kinds were staged that would have done credit to any establishment. Many of these working men have small glasshouses, in which they grow these plants—such plants, indeed, as are very rarely seen shown by cottagers; their cut flowers, hardy fruits and vegetables were very fine.

In the division open to all, Mr. J. Cypher, of Cheltenham, took the 1st prize, with twelve good flowering plants. In the amateurs' division for six Orchids, an exhibitor whose name could not be ascertained, had Cattleya Gaskelliana, C. Harrisonae, and C. Leopoldi; Cyrtopodium longifolium, Dendrobium Dearii, and Aërides Lobbii. Begonias generally well grown in the west of England, were good; and other flowering plants included Fuchsia, zonal Pelargoniums, Cockscombs, Japan Lilies, Gloxias, &c.

With eight fine-foliated plants, Mr. Cypher came to the fore with Croton Newmanii, C. Sunset, and

C. Thompsoni, *Latania borbonica*, *Cordylone indivisa*, *Kentia australis*, *K. Forsteriana*, &c. A fine lot of eight exotic Ferns came from an exhibitor whose name was not placed upon the plants until late in the day. It included examples of *Todea superba* and *T. pellucida*, *Adiantum concinnum latum*, *Davallia Mooreana*, &c.

Cut Flowers.—Messrs. Parker & Sons, St. Michael's Hill Nursery, Bristol, had the best twenty-four Roses, comprising some very fresh and bright flowers. Messrs. Heath & Son, Cheltenham, were 1st, with twenty-four show Dahlias—a fine lot of blooms. In the class for twelve fancy Dahlias, Mr. Hobbs was 1st. A good stand of single Dahlias was shown by Mr. A. A. Walters, Bath; and Cactus Dahlias by Mr. R. Pearce.

Other cut flowers comprised excellent German and French Asters, Phloxes, Gladioli, stove and greenhouse plants, hardy flowers, Hollyhocks, and many others. In some respects, the plants and cut flowers shown by amateurs were superior to those shown in the open classes.

Fruit was not numerous. The best collection of eight dishes came from Captain J. G. Bayley, who had Black Hamburg and Muscat of Alexandria Grapes, Grosse Mignonne Peaches, Pine-apple Nectarine, &c.; Mr. G. Garraway, Bath, was a good 2nd. Alicante and Black Hamburg were the best black, and Buckland Sweetwater and Foster's Seedling the best white Grapes, Dymond and Royal George the best Peaches, Pine-apple and Rivers' Orange the best Nectarines, while Pears were represented by Jargonelle, dessert Apples by Irish Peach and Red Astrachan, culinary Apples by Lord Suffield, Lord Derby, and Cox's Pomona, and other hardy fruits were in excellent condition.

A WORKING-MAN'S FLOWER-SHOW AT NEW CROSS.

ONE satisfactory feature about metropolitan gardening is the fact that flower shows, in which only the labouring-classes compete, are on the increase in London. Lately, what is being done in Bethnal Green was noticed, and this week we were invited to one held at New Cross, in the midst of a small city of streets of workmen's dwellings, that now cover what was formerly South London market gardens. In the midst are the engineering works of Messrs. Stone & Co., and the principals of this establishment built opposite their works what is known as the Welcome Institute, which includes a coffee-tavern, workmen's club, &c., and attached to which is a good-sized lecture-hall, available for concerts, &c. It is in this hall the flower show was held. It was commenced last year; but the second exhibition, which took place on August 28 and 29, was a decided advance in quality.

In addition to the flower show, there was an interesting and instructive exhibition of paintings, drawings, and models, by adults and by youths under twenty-one years of age. All members of the Welcome Institute are allowed to exhibit free, but non-members are charged an entrance fee of sixpence.

Tasteful collections of pot plants were staged, including *Ficus elastica*, *Lilium auratum* and *L. speciosum*, *Nicotiana affinis*, evidently a plant that blooms well in a close atmosphere; Begonias, foliated and flowering; *Coleus*, *Aspidistra lurida*, green and variegated; Fuchsias, *Petunias*, double and single; Stocks and Asters; *Lobelia*, Musk (Harrison's), zonal Pelargoniums; and in one or two of the groups were Tuberoses in bloom.

Considerable zest was given to the competition because a silver cup was offered to the exhibitor who made up the best portion of the show. This was won by F. Bannister, who took five 1st and six 2nd prizes in leading classes.

Very tasteful and effective groups of plants were furnished to help the display by Messrs. E. J. and F. J. Preston, two members of the firm of Messrs. Stone & Co.

Cut flowers included decorative Dahlias, Stocks, Sweet Peas, annual Chrysanthemums, Zinnias, Mignonette, &c. And in the vegetable classes were Cucumbers, Vegetable Marrows, French Beans, and Tomatos; all very creditable, considering the locality which produced them. A band performed each day during the afternoon and evening.

ROYAL OXFORDSHIRE HORTICULTURAL.

AUGUST 27.—This was the third of a series of four shows held annually by this Society in the quadrangle of Queen's College, the plants and flowers

being arranged under the covered colonnade; the vegetables on tables in the open. It is largely a cut flower, fruit, and vegetable exhibition, but the specimen plants which were staged were good. Mr. G. Jacob, nurseryman, Witney, had the best six stove and greenhouse plants—*Latania borbonica*, *Croton Weismanni*, and a fine piece of *Plumbago capensis alba*. The best specimen stove plant was a fine *Croton majesticus*, from Mr. G. Jacob; a *Fuchsia Charming*, from Mr. J. Mattock; the best ornamental-foliage plant, *Latania borbonica*, from G. H. Morrell, Esq.

In the amateur class, for a specimen hardy plant, Mr. W. F. Cross was 1st, with *Staturea incana*. Mr. J. Mattock had the best six Fuchsias, bush specimens.

Begonias were a good feature. In the open division, Mr. J. Johnson was 1st, with six well-grown and bloomed plants of excellent varieties.

Mr. Johnson took the 1st prizes with half-a-dozen of each of Pelargoniums, single and double (zonal's). In the class for six tricolors, Mr. Mattock was 1st, with very fine grandly-coloured varieties, Mrs. H. Cox, Empress of India, Dolly Varden, Lady Cullum, Mrs. Laing, and Mrs. Pollock.

Foliage plants included an excellent half-dozen Ferns from Mr. C. Jacob, Barton, who had *Adiantum tenerum*, A. Farleyense, A. cuneatum, A. grandiceps, A. Williamsii, and a piece of the Bird's-nest Fern. Hardy Ferns were shown by Messrs. Walker and Johnson.

Cut Flowers.—A class for twenty-four bouquets brought a good lot from Mr. J. Walker. Zonal Pelargoniums in three trusses of twelve varieties were superbly shown by Messrs. Mattock and Walker, but in the class for the same number of double varieties, the positions were reversed. Dahlias.—Mr. J. Walker was 1st, with twenty-four excellent blooms. Mr. Walker also had the best eighteen. Mr. Walker was 1st, with Pomponé varieties, and also with singles; and Mr. J. Mattock, with Cactus varieties. Roses were well shown by Mr. J. Mattock; Hollyhocks, in twelve spikes, by Mr. C. Hill, Rowley Nurseries; Asters, German and French, by Mr. J. Walker and the Rev. R. F. Dale, Bletchington Rectory; Zinnias, double, by Mr. J. Walker; Gladioli, by Mr. J. Johnson; and hardy perennials, by Mr. R. Price and Mr. T. Arnall.

A First-class Certificate of Merit was awarded to Mr. John Walker, for twelve blooms of his fine white self Dahlia, J. Walker.

Fruit.—The best Melon was Benham Beauty, followed by Golden Perfection. The best dish of Peaches was Alexander Noblesse, from Mr. C. T. Hawkins, Summertown; Colonel Miller of Shot-over House, 2nd, with Grosse Mignonne. The best dish of Nectarines was Hunt's Tawny, from Mr. G. H. Morrell; Colonel Miller, 2nd prize, with Elruge. The latter had the best dish of Apricots. The best Plums was Oullin's Gage, Reine Claude Violette taking the 2nd prize. The best culinary Plums were Goliath and Pond's Seedling. Green Gages shown in a class by themselves, were plentiful and good. The best dessert Pear was Jargonelle; the best dessert Apples were Red Astrachan, Gladstone, and Quarrenden. The best culinary Apples Domino, Lord Suffield, and Lady Henniker. Black and white Grapes were well shown; Black Hamburg was finely shown for the former; and White Muscat for the latter.

Vegetables.—The soil surrounding Oxford is evidently well-adapted for producing vegetables. A variety of Runner Beans, named Oxonian, raised at Oxford twenty years ago, long, handsome, and tender. The best collection of six dishes of vegetables came from Mr. J. Akers.

For some reason, it is not the practice at Oxford to place the name of the gardener who exhibits on the exhibition-card, though it is generally observed elsewhere. This is the reason why the gardeners' and growers' names do not appear in the foregoing report.

DALKEITH FLOWER SHOW.

THE Dalkeith Horticultural Society held its annual flower show in the Corn Exchange, Dalkeith, on the 5th inst. There was a falling off in the number of entries, as compared with the average of recent years; but the quality of the exhibits was superior. Keen competition took place in certain classes, particularly in hardy cut flowers, that requiring trusses of eighteen distinct species, for which four prizes were offered, bringing six competitors, the combined effect of the several stands being an imposing and attractive feature of the show. Mr.

Cairns, Dalkeith Gardens, was placed 1st, Mr. J. Paterson 2nd, and Mr. T. Pringle (Secretary) 3rd.

A very interesting section of the show is that which is devoted to industrial and art subjects, and on this occasion it exceeded, both in extent and general interest and excellence, any previous collection of the kind.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

THIS Association held its ordinary monthly meeting on the 1st inst., in 5, St. Andrew Square, Edinburgh, Mr. James Greive, Vice-President in the chair. Mr. Mark King, Bonnington, read a paper on "Poisonous Plants," in which he dealt chiefly with those that are indigenous to Britain. Dr. J. H. Wilson gave a lecture on the "Fertilisation of Flowers," which was illustrated by numerous diagrams and blackboard drawings. Some interesting original observations of the lecturer's, on the fertilisation of *Wachendorfia*, *Albuca*, and *Aspidistra*, were much appreciated for their ingenuity. Both the lecture and the preceding paper were accorded warm votes of thanks. Of exhibits, there were very few. Dr. Paterson, Bridge of Allan, sent a specimen of *Glycyrrhiza glabra* in flower, interesting on account of the rarity of its producing flowers in Scotland. Dr. Paterson stated in a note accompanying the specimen that the plant had been known to flower in Scotland only three or four times during the last sixty years. A very nice selection of cut blooms of seedling Carnations were exhibited by Messrs. Methven & Sons.

READING HORTICULTURAL.

SEPTEMBER 2.—The storm of wind which visited the town of Reading on the 1st inst., blew down the tent which covers the site for the exhibitions of this society in the Abbey Ruins, and a series of tents pitched in the Forbury Gardens had to be used; and it seemed as if the entire change in the arrangements pleased the many exhibitors. It was a capital show, and some charming groups for effect were arranged. The best came from Mr. Aitken, gr. to C. Meeking, Esq., Ritchings Park, Slough; Mr. Bright, gr. to P. Karslake, Esq., White Knights, Reading, was a good 2nd. Some small groups were also shown, the best coming from Mr. Bright, gr. to G. Palmer, Esq., Reading. Six excellent stove and greenhouse plants from Mr. Aitken were awarded the 1st prize in class 1; Mr. Mould, nurseryman, Pewsey, was 2nd. The best new or rare plant was *Gymnogramma Pearcei robusta* from Mr. Aitken. Mr. Bright's Fuchsias were very fine, and some good tuberous-rooted Begonias were staged.

Messrs. Aitken and Mould were also 1st and 2nd, with six ornamental foliage plants, the best specimen was a splendid *Croton Queen Victoria*, from Mr. Aitken. Palms, *Coleus*, and table plants were also good. Stove and greenhouse Ferns were a leading feature; Mr. Aitken, and Mr. Hollis, gr. to H. J. Simonds, Esq., Caversham, showing very fine specimens. In the amateurs' division, the exhibits were less numerous than usual.

Cut flowers comprised excellent Dahlias from Mr. Mortimer, Swiss Nursery, Farnham; and Mr. John Walker, Thame. Very pretty bunches of single varieties from Messrs. J. Cheal & Sons, nurserymen, Crawley; Roses from Messrs. Perkins & Sons, nurserymen, Coventry; and Mr. E. F. Such, Maidenhead, staged good Asters, Gladioli, stove and greenhouse and hardy flowers, Zinnias, &c.

Table decorations were, as usual, very pretty and bright, and though small prizes are offered, the competition by ladies is always very keen. Bridal and buttonhole bouquets, baskets of sweet-scented flowers, &c., were all pleasing features.

Fruit was largely and finely represented. Mr. Aitken took the 1st prize with a collection of eight dishes; Mr. Goodman, gr. to Miss Hammersley, Bourne End, was a close 2nd. Mr. Johnston, gr. to A. Gilliat, Esq., Stoke, had the best six dishes. Fine Black Hamburg Grapes were shown by Mr. Turton, The Gardens, Maiden Erleigh; and Mr. Ashman, gr. to J. R. King, Esq., Billingbear. Any other black were represented by fine Alicante, from Mr. Osman, Ottershaw Park; and Mr. D. Pound, jun., gr. to A. W. Sutton, Esq., Reading. Mr. Gilbert and Mr. Cane, of Ascot, were 1st and 2nd, with remarkably good white Muscats; any other white was represented by Buckland Sweetwater from Mr. Ashman, and Golden Queen from Mr. Doey. Peaches were represented by fine Bellegarde, Nectarines by Pine-apple, and Apricots by Hems-

considerably higher than any previously recorded in either of the three preceding months. Over 'England' they varied between 80° and 86°, over 'Scotland' between 74° and 81°, and over 'Ireland' between 77° and 78°. The lowest of the minima were registered at most stations, either on the 6th or 7th, and were rather low generally. In 'Scotland, N. and E.' they ranged from 31° to 35°, over 'Ireland' from 36° to 37°, and over 'England' from 39° in the 'Midland Counties,' to 45° in 'England, S.W.' In the 'Channel Islands' the lowest reading was 51°. The range of temperature during the week was very large; in the 'Midland Counties' and 'Scotland, E.' it amounted to 47°.

"The rainfall has been a little more than the mean in 'Ireland, S.,' but in all other parts of the Kingdom a deficit is shown.

"The bright sunshine has continued short of the mean in 'Scotland, N.,' but in all other districts it has been greatly in excess. The recorded percentage of the possible duration was as high as 89 in the 'Channel Islands,' 73 in 'England, E.,' and 65 both in the 'Midland Counties' and 'England, S.' Elsewhere it ranged from 60 in 'England, S.W.,' to 42 in 'Ireland, N.,' and to only 22 in 'Scotland, N.,"

NOTICES TO CORRESPONDENTS.

AMERICAN BLIGHT: *A Subscriber.* Dissolve 1 lb. of soft soap and 1 gallon of lime in water, to make a thick whitewash. Apply this with stiff brush to the branches now. Keep the ground free from weeds, and see that it is well drained.

BOILERS, PIPES: *A. F.* You may remove these, which come under the designation of trade appliances; but you should leave all in fair order, or the landlord may sue you for damages done to his property. Any glass and wood or iron buildings that may be fixed with bolts to brick or stone foundations becoming, failing an agreement to the contrary, the property of the landlord.

CABBAGE DISEASED: *W. & S.* See reply on p. 257, under "Namea of Plants."

CORRECTION. On page 311, line 43, in our report of Royal Horticultural Society, the Chrysanthemum named Mrs. Whiteley, should be "Miss Whiteley."

DISEASED IVY: *T. D.* Common on Ivy leaves (Phyllosticta hedericola). Pluck off and burn every diseased leaf as soon as the disease appears, and if this is done persistently, it will be stamped out. *M. C. C.*

DISEASED MELON: *S. S.* The roots of your Melons are infested with eel-worms. Turn all the soil out, and burn it along with the plants, and start with fresh material.

FILBERTS: *T. M.* A fairly rich, friable loam of good depth, resting on a rocky stratum, or on gravel. The drainage should be good, and the position open. There is a comprehensive work on the subject in German, entitled, *Die Haselnuss*, by F. Goeschke (Paul Parey, Berlin); and a pamphlet of 230 pages, by Mr. D. T. Fish (Upcott Gill, *The Bazaar Office*, 170, Strand, London, W.C.)

FRUITS FOR EXHIBITION: *R. W. N. C.* Kitchen Apples—Lord Grosvenor, Worcester Pearmain, Cellini, Cox's Pomona, Warner's King, Ecklinville, Peasgood's Nonsuch, Dumelow's Seedling, Golden Spire, Bramley's Seedling, Winter Hawthornden, Emperor Alexander. Dessert Apples—Blenheim Orange, Ribston Pippin, Beauty of Bath, Irish Peach, Devonshire Quarrenden, Cox's Orange Pippin, Melon Apple, Syke House Russet, Red Astrachan, Court of Wick, Annie Elizabeth, Brad-dick's Nonpareil. Gooseberries, 6 best late kinds—Perfection (Gregory's), Red Warrington, Iron-monger, Whitesmith, Pitmaston Green Gage, Red Champagne.

MAGNOLIAS: *J. L.* Magnolias may be cut back into the old wood at this season, taking care to paint over with dark-coloured oil-paint all the large cut surfaces. The next best time is just before growth commences.

NAMES OF FRUITS: *H. T.* 1, Emperor Alexander; 2, Cox's Orange Pippin; 3, Wheeler's Russet; 4, Bramley's Seedling; 5, Tower of Glamis; Plum Jefferson: it is attacked by mussel scale (*Aspidiotus conchiformis*); wash the trees with soft-soap suds and lime water, especially in spring; if on walls, uncoil the trees and paint the wall with cement "slip."—*Led.* 1, Louise Bonne of

Jeraey; 2, Emile d'Heyst.—*M. F.* 1, Probably a seedling; 2, Ribston Pippin; 3, Royal Codlin; 4, Cannot identify.—*J. H.* Apple not known—worthless.—*R. S. G.* Pears, 2, Fondante d'Autonne; 3, Hessel; 4, not known; 5, Vicar of Winkfield; 6, Catshead Apple; Peach Belle-garde; Plum Victoria.—*J. R. M.* 1, Washington; 2, Black Diamond; 3, Kirke's.—*Q. R.* Apple: Kerry Pippin. Plums: 1, Eugène Fürst; 2, Mitchelson's; 3, probably Red Magnum Bonum (fruit smashed); 4, Victoria; 5, Diamond.—*E. G.* Probably, Mr. Gladstone.

NAMES OF PLANTS: *Ivy.* Gypsophila paniculata, hardy herbaceous perennial, from South-Eastern Europe; to be obtained from most nurserymen.—*W. J.* Chenopodium urticum (Upright Goose-foot).—*W. L.* 1, Juniperus chinensis; 2, Thuopsis borealis; 3 and 4, varieties of Abies Douglasi; 5, Retinospora pisifera; 6, Rhus cotinus—wig plant.—*G. N.* 1, Salix caprea (we were in error before); 3, probably S. phyllifolia. We cannot name the others from the materials sent.—*W. H. M.* Actaea spicata rubra.—*H. H.* 3, Cerasus lusitanica azorica; 4, Coreopsis lanceolata; Roses next week.—*L. C. H.* Helianthus rigidus.—*E. R.* Colutea arboreacens, Tropaeolum speciosum.—*J. H.* 1, Polygonum cuspidatum; 2, Lycium barbarum; 3, Casuarina sp.

PLATYCIERIUM GRANDE, RAISING FROM SPORES: *J. M.* The plant being a native of the Malayan Archipelago, its spores, when sown in scalded peat and silver-sand, should be placed in a rather close and warm propagating-case, or under a bell-glass in a Pine-pit. The fertile fronds are stipitate, rising from the sinus of the sterile ones. A good deal of observation is needed, so as to obtain the spores when they are in a mature state.

PLUMS: *G. S.* Your seedling Plums are inferior to many others in cultivation.

ROSES FROM SEED: *G. P.* We have no correspondent at Lagos, but we do not think it likely Roses would do well in such a climate. As no one can tell till he tries, let trial be made and results recorded in *Gardeners' Chronicle*.

SCALE ON BLACK CURRANTS: *H. H. D.* The branches are infested with mussel scale (Mylaspis pomorum). Mix soft-soap suds and tobacco water and a little sulphur powder, rub this in thoroughly with a stiff brush. Repeat two or three times in winter.

SUNFLOWERS: *W. S.* You should either send some flowers and leaves of your new crosses to us for our inspection, or show them at the next meeting of the Royal Horticultural Society.

TWIN DAHLIA: *X.* Two flower-heads were pressed together at a very early stage, and became united in consequence.

TRADE MARK.

FOR PLANTS.

QUICK. LASTING. ECONOMICAL.

The Gardens, Seacor Heath, Hawkhurst, Kent, March 11, 1891.

DEAR SIR.—Having used your "Clay's Invigorator" for some time, I am exceedingly pleased with the results obtained from it. As an Exhibitor I have used it upon most sorts of Vegetables with great advantage; also upon many sorts of Stove and Greenhouse Plants, Melons, Cucumbers, Tomatos, Pot Strawberries, Chrysanthemums, &c. For Lawns it has a quick and beneficial effect. For Amateurs and those with small gardens, where there is a difficulty in obtaining stable or farm-yard manure, your "Invigorator" ought to be of special value, as it is clean in use, easy of application, and reasonable in price.—Yours respectfully, J. GILMOUR, Gardener to the Right Hon. G. J. GOSCHEN, M.P.

Sold by Seedsmen, Florists, and Nurserymen, or direct from the Works, in 6d. and 1s. Packets, and SEALED BAGS:—

7 lbs. 14 lbs. 28 lbs. 56 lbs. 112 lbs.
2s. 6d. 4s. 6d. 7s. 6d. 12s. 6d. 20s.

The above Trade Mark is printed on every Packet and Bag, and also impressed on the Lead Seal attached to the mouth of each Bag.

A SAMPLE PACKET will be sent post-free on receipt of ONE SHILLING by the MANUFACTURER—

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender: this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for terms.

SPECIMEN FREE. Price 2d.

HOLLOWAY'S OINTMENT and PILLS

Need only a single trial to make known their capabilities. No outside sore or inward inflammation can long withstand the cooling, purifying, and healing influences exerted by these two Medicaments. Be the mischief recent or chronic, great or slight, painful or simply annoying, it will succumb before the curative virtues of these noble remedies, which can be rightly applied by any person who will attentive y read their accompanying directions, which are propounded in the plainest language, void of technical terms, and printed in the most legible characters. To the man of business, confined to his counting-house, and harassed by engagements, these Pills are invaluable; for the man of pleasure, addicted to free living, they are peerless.

ODONTOGLOSSUM CRISPUM ALEXANDRÆ.

BEST (PADRO) VARIETY.

Friday Next.

2000 OLD LABIATA.

THE TRUE OLD AUTUMN-FLOWERING CATTLEYA LABIATA.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, October 2, at half-past 12 o'clock, a magnificent importation of the TRUE OLD AUTUMN FLOWERING CATTLEYA LABIATA.

The whole importation is offered, and the plants are in magnificent order and condition; from 1 to 6 flower-seats can be seen on the old spikes, many of which are of enormous size and thickness.

ALL THE PLANTS ARE GUARANTEED TRUE.

The genus Cattleya was founded upon the species we now offer. Dr. Lindley first described it from Swainson's plant, introduced in the year 1835, and named it in honour of W. Cattley, Esq., of Barnet. This plant was now re-discovered and re-introduced, is absolutely the CATTLEYA LABIATA AUTUMNALIS VERA from Swainson's original hunting-ground.

CATTLEYA LABIATA, TRUE,

the queen of Cattleyas, and the finest of the genus.

Cattleya labiata was discovered by W. Swainson in 1817, and since that year several small consignments have arrived in Europe; but in about 1830, Mr. Horsfall, of Liverpool, received some through a captain in one of his ships. Again, in about 1855, some plants came to Europe, and in 1882, Mr. Bartlett, of the Zoological Gardens, London, received a small consignment, and he disposed of it to Mr. K. S. Williams, of Upper Holloway; and two years ago a gentleman in Paris received a small importation. Now, however, we have succeeded in securing the enormous quantity above offered, and the whole in grand health; and such a consignment as offered to-day to the public could never have been thought of years ago, and our collectors had to employ more than a hundred men in order to get the plants together, fearing the rainy and growing season would set in. For trade growers, an opportunity like the present to purchase this Cattleya is specially opportune, as all the plants are in splendid order. The old labiata is a free-growing Cattleya, and makes rapid growth, and is unequalled for cut-flower purposes and grandeur of variety as a selling plant.

On view morning of Sale, and Catalogues had.

MESSRS. PROTHEROE AND MORRIS will include in their SALE on FRIDAY NEXT, October 2, the following valuable Orchids:—

- VANDA SANDERIANA, splendid plant, in bud.
SOBRALIA LEUCOXANTHA, splendid plant.
CYPRIPEDIUM NITIDISSIMUM, finer than GRANDE. First-class Certificate. Splendid specimen.
LELIA AKOUIDIANA, a grand hybrid, which gained the Gold Medal of the Royal Horticultural Society.
ODONTOGLOSSUM HORSMANNIANUM, Reich, and Rolfe, very fine plant, and unique.
ODONTOGLOSSUM HYBRIDUM LONDINENSE, shown at Last Temple Show.
VANDA ROBERTSIANA, new. Will shortly be described.
DENDROBIUM CASSOPHE, fine hybrid between D. nobile album and japonicum.
Also many popular and useful Brazilian Orchids.
On view morning of Sale, and Catalogues had.

Seedling Cypripediums.

MESSRS. PROTHEROE AND MORRIS will include in their SALE on FRIDAY NEXT, October 2— Nearly 100 SEEDLING CYPRIPEDIUMS, raised by the late Mr. F. HORS, of Dresden. The plants are from 1 to 3 years old, and in fine health.

On view morning of Sale, and Catalogues had.

Derby.

TWO DAYS' UNRESERVED CLEARANCE SALE of STOVE and GREENHOUSE PLANTS.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, on the Premises, the Mile Ash Nurseries, Derby, about a mile from the Midland Railway Station, on TUESDAY and WEDNESDAY, September 29 and 30, at 12 o'clock precisely each day, Without Reserve, the whole of the STOVE and GREENHOUSE PLANTS, comprising 2000 Arabias, large specimen Roses, 250 large Camellias and Azaleas, suitable for cut flower; 400 Camellias, 2 to 4 feet; specimen Orchids, suitable for cut flower; specimen Palms and Greenhouse Rhododendrons, Lapagerias, 200 Palms, of sorts; 1500 choice Ivies, 4000 Maidenhair Ferns, 6000 Narcissus, and quantities of other Stock. Also brown HORSE, two Spring Market VANS, two Spring DRAYS, GARDEN ROLLER, LAWN MOWERS, and a quantity of GLASS and useful Sundries.

May be viewed three days prior to the Sale. Catalogues had of Mr. COLLING, on the Premises; and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C.

N.B.—The Sale of the Outdoor NURSERY STOCK will take place on the Premises in October next.

Bagshot.

HIGHLY IMPORTANT THREE DAYS' UNRESERVED SALE of beautifully-grown and well-rooted NURSERY STOCK, which has been carefully prepared for removal, and specially selected for this Sale, by order of Messrs. John Waterer & Sons, Limited.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the celebrated Bagshot Nurseries, Bagshot, Surrey, close to Bagshot Station, on WEDNESDAY, September 30, and two following days, at 12 o'clock each day, without reserve, several acres of NURSERY STOCK, grown to the greatest perfection, and exceedingly well-rooted, comprising a variety of Conifers, splendid specimens, 4 to 7 ft., particularly adapted for effective planting; well-coloured Golden Retinosporas; very fine specimen Gold and Silver Variegated Hollies, 4 to 6 ft.; finely-grown examples of Waterer's Holly; Standards and Pyramids one single specimens; 1000 Green Hollies, 3 to 5 ft.; very fine English Yews, 2 1/2 to 3 ft.; 200 named Rhododendrons, 2 to 2 1/2 ft., bushy plants of the best and newest kinds; Ponticum Rhododendrons in quantity; 3000 Spruce Firs, 2 1/2 to 4 ft., and a quantity of larger plants adapted for Christmas Trees; 5000 Standard Ornamental Trees, 8 to 12 ft.; Purple Beech and Limes, 10 to 12 ft.; thousands of Flowering Shrubs; and other Stock.

Purchasers will be allowed until December 31, 1891, for the removal of their lots.

May now be viewed. Catalogues can be obtained on the Premises, or on application to the Auctioneers, 67 and 68, Cheapside, E.C.

The Chilwell Nurseries, Chilwell, Notts.

Three-quarters of a mile from Beeston Railway Station, Midland Railway.

IMPORTANT SALE of EVERGREENS, CONIFERAE, &c., growing upon two branch nurseries which are required for building purposes by order of Messrs. J. R. Pear-son & Sons.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, on the Premises, above on THURSDAY, October 1st, at 1 o'clock precisely, 1,000 specimen GOLDEN YEWs, a fine collection of Green and Variegated HOLLIES, 800 Bushy AUCUBAS, specimen and half-specimen RHODODENDRONS, of the finest named varieties, thousands of SMALL SHRUBS for potting or growing on, 300 YUCCA FILAMENTA VARIEGATA, the largest number of this scarce plant ever offered, 4,000 LAURELS of sorts, 1,200 CUPRESSUS, including 400 C. ARGENTEA, perfect specimen Standard and Dwarf ROSES, Standard THORNs and other Stock.

This Sale is especially worthy of attention owing to the high-class character of the Stock, all of which has been recently transplanted and grown with plenty of room.

The Golden Yews and Yuccas, for which the Nurseries have long been famous, are the finest lot ever offered by Public Auction.

May be viewed one week prior to the Sale. Catalogues obtained on the Premises, and of the Auctioneers, Cheapside.

Enfield Highway.

UNRESERVED CLEARANCE SALE, by order of Mr. George Perry, Jun., who is relinquishing business.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, 2, Bedford Road, Green Street, Enfield Highway, N., eight minutes' walk from Brunswick Station, G.E.R., on TUESDAY, October 6, at 12 o'clock, 18,000 HERBACEOUS PLANTS in grand assortment; 12,000 PANSIES, all of the choicest named kinds; 20,000 CARNATIONS (11,000 in pots), comprising Germania, Mrs. Reynolds Hole, Mrs. Frank Watts, Mrs. Worrie Braggart, Mr. G. Perry, Florence Perry, and others; also a large number of choice Seedlings, 10,000 PINKS, 1000 VERONICAS, 5000 ROSES, on own Roots; 800 AUCUBAS and BOX, Erection of Shed, &c. Six weeks will be allowed for removal of Roses. May be viewed any day prior to the Sale. Catalogues may be had on the premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Walham Green.

CLEARANCE SALE of GREENHOUSE LIGHTS, PIPING, and STOCK.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION on the Premises, The Nursery, Farm Lane, Walham Green, on WEDNESDAY, October 7, at 12 o'clock, by order of Mr. W. Brown, without the least reserve, 3000 FERNS, 10,000 CHRYSANTHEMUMS, BITCH REPPENS, BEGONIAS, 20,000 GOLDEN and GREEN ETUONYMUS, the erections of eleven GREENHOUSES, HOT-WATER PIPING, BOILERS, 250 PIT LIGHTS, and FRAMES, SHEDS, MARKET VAN, and other items. On view two days prior to the Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Sunningdale, Berks.

ANNUAL SALE, without Reserve.—SIX DAYS' ABSOLUTE CLEARANCE SALE of several acres of beautifully-grown and thriving young NURSERY STOCK, carefully prepared for removal; by order of Mr. Charles Noble.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the premises, The Nurseries, Sunningdale, close to Sunningdale Station, on MONDAY, October 5, and five following days, at 12 o'clock precisely each day; a splendid lot of Standard and Bush Rhododendrons, of the best kinds, many of them extra fine specimens for which these Nurseries are so famed; good bushy Ponticum Rhododendrons, 1 to 2 1/2 feet; Flowering Shrubs, in great variety. Many thousands of Conifers, 3 to 5 feet, consisting of Cupressus, Thujas, and Myopsis, specially adapted for hedges or borders; a large assortment of specimen Trees and Shrubs, including Gilded Retinosporas, variegated Hollies, Abies, and others for effective planting. 10,000 oval-leaved Privet; a large quantity of Mahonia Aquifolia, Harry Heaths, Ivies; a fine collection of Standard and Pyramid Apples, Damsons, Pyramid Pears, Gooseberries and currants of the most approved kinds; Cob Nuts, and other Stock.

Luncheon will be provided for intending purchasers, and arrangements can be made with Mr. Noble to lift and forward lots to all parts of the Kingdom at the mere cost of labour incurred and material used.

The Stock may now be viewed. Catalogues can be obtained on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Isleworth.

ANNUAL SALE of YOUNG NURSERY STOCK, grown specially for the Trade.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. C. Lee & Son to SELL by AUCTION, on the Premises, the Wood Lane Nursery, Isleworth, on THURSDAY, October 8, thousands of young CONIFERS, for growing on, and other Stock.

Catalogues of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Leyton, E. By Order of the Mortgagee.

The VALUABLE LEASE of the NURSERY, 87 years unexpired; also the ERECTIONS of SEVERAL GREENHOUSES, PIPING, and BOILERS; 6000 CHRYSANTHEMUMS, in 16 and 24-pots; 600 MYRTLES, large WHITE AZALEAS, MAIDENHAIR FERNS, TUBEROSES, TULIPS, and other STOCK; VAN, BARROWS, and TOOLS, in suitable lots.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL the above by AUCTION, on the Premises, the Nursery, Beaumont Road, Leyton (between Leyton and Hoe Street Stations, G.E.Ry.), on THURSDAY, October 8, at 12 o'clock.

May be viewed. Catalogues had of Mr. HART, on the premises; of Messrs. W. H. SMITH and SON, Solicitors, Gre-sham House, 104 Broad Street, E.C.; and of the Auctioneers, 67 and 68, Cheapside, E.C., and Leytonstone, E.

Woking.

UNUSUALLY IMPORTANT SIX DAYS' SALE of exceptionally well-grown NURSERY STOCK, in the finest possible condition for transplanting, and embracing the most important lot of stock offered for Auction for many years, the quality of which is unsurpassed in the Trade.

GREAT UNRESERVED SALE by order of the Trustees of the late Mr. George Jackman.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the Woking Nurseries, Woking, Surrey, on MONDAY, October 12, and FIVE FOLLOWING DAYS, at 12 o'clock precisely each day, several acres of unusually well-grown NURSERY STOCK, comprising 10,000 Conifers, 3 to 7 feet; thousands of smaller Evergreens and Conifers; 1500 Picea Nordmanniana and Picea; 4000 Box, in variety, 1 to 4 feet; 1000 Arancaria imbricata, 1 to 3 feet; 3000 Aeneas, in variety, 1 to 4 feet; 3000 Laurels of sorts, 2 to 5 feet; 2000 English and Golden Yews, 2 to 7 feet; 1000 Gold, Silver, and Green Hollies; 5000 deciduous Flowering Shrubs; 5000 named Rhododendrons, 1 to 3 feet; 2000 Limes, 5 to 10 feet; 1000 Purple Beech, 6 to 10 feet; 1000 Maples, in variety, 7 to 10 feet; Forest Trees in great quantities; 60,000 common Ash, 2 to 5 feet; 50,000 Quick, 1 to 2 feet; 10,000 English and Turkey Oaks, 2 to 5 feet; 6000 English Laurels, 3 to 5 feet; a splendid collection of Ornamental Trees for park and avenue planting, 10 to 20 feet; 5000 Standard and Feathered Plums; Damsons, Quinces, &c.; 2000 Standard and Feathered Flowering Almonds, Peaches, and other Stock.

Goods can be transmitted from Woking Railway Station to all parts without change of truck.

The Auctioneers have personally visited the nurseries and desire to call attention of intending purchasers to this Sale, as it is undoubtedly the most important Auction of Nursery Stock that has been held for many years.

An inspection will well repay a visit by those contemplating planting during the season.

May be viewed. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Windlesham Nurseries, Bagshot, Surrey.

Seed & Bulb Growers **DICKSONS CHESTER**

EDINBURGH.

Our remarks in last week's, respecting our BEGONIAS and CACTUS DAHLIAS in the South, applies exactly now to our exhibit at the great International Show in the North, only with greater force, weight and effect; for there was nothing there, or had there ever been, to approach either. It was openly said they were the feature of the Show, and would remain vivid on the minds of all as long as memory lasted. But it was almost grievous—after what we have done, and are still doing, to perfect the habit and flowers of the lovely Begonia—to find such a quantity of inferior ones in the neighbourhood. We ask all to "Come and See." We left at home far better ones for seeding than those we exhibited at the two recent Shows.

As a proof of the above, we append the following:—

Captain W. E. MAY, Rutherford House, Penicuik, September 10th, 1891.

Gentlemen,—Allow me to congratulate you on your magnificent display of Dahlias and Begonias at the Edinburgh Show, which was one of the features of the Exhibition. It was allowed by all to be the finest exhibit ever seen in the North.

J. MITCHELL, Esq., Emerald, Aberdeen, September 12th, 1891.

Sirs,—At the recent great Show in Edinburgh, I was greatly impressed with the beauty of your Begonias and Cactus Dahlias.

H. CANNELL & SONS,
SWANLEY, KENT.

ANTHONY WATERER invites an inspection from intending Planters to the following well-grown TREES, having stout, clean stems, with handsomely-furnished, well-balanced heads, and from frequently transplanting are splendidly rooted, the girth of the stem is taken at 4 feet from the ground.

- ACACIA BESSONIANA, 10 to 14 feet, girth 3 to 4 inches.
- ACER DASYCARPUM, 14 to 20 feet, girth 4 to 8 inches.
- .. WIERII LACINIATA, 10 to 14 feet, girth 3 to 5 inch.
- .. NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
- .. REITENBACHII, 12 to 14 feet, girth 4 to 5 inches.
- .. SCHWEDLERII, 12 to 18 feet, girth 4 to 8 inches.
- .. WORLEYII, 12 to 14 feet, girth 3 to 6 inches.
- ASH, Mountain, 12 to 14 feet, girth 4 to 5 inches.
- BEECH, Purple, Pyramids, and Standards, 10 to 20 feet, girth 4 to 9 inches.
- BIRCH, Silver, 12 to 14 feet, girth 3 to 5 inches.
- CERASUS SEROTINA (American Bird Cherry), 12 to 16 feet, girth 4 to 7 inches.
- CHESTNUTS, Horse, 14 to 20 feet, girth 6 to 11 inches.
- .. Double White, 14 to 16 feet, girth 6 to 8 inches.
- .. Scarlet, 12 to 18 feet, girth 4 to 10 inches.
- .. Spanish, 12 to 14 feet, girth 4 to 5 inches.
- ELMS, English, 10 to 12 feet, girth 3 to 6 inches.
- .. Guernsey, 16 to 18 feet, girth 7 to 9 inches.
- LIMES, 12, 16, and 20 feet, girth 3 to 10 inches.
- .. EUCHLORA or DASYSITTA, 12 to 14 feet, girth 4 to 6 inches.
- .. Silver-leaved (Tilia argentea), 12 to 14 feet, girth 5 to 6 inches.
- LIQUIDAMBER, 6 to 10 feet.
- MAPLE, Norway, 12 to 16 feet.
- OAK, English, 12 to 14 feet, girth 4 to 5 inches.
- .. Scarlet American, 12 to 14 feet, girth 4 to 5 inches.
- PLANES (English-grown), 12 to 16 feet, girth 4 to 5 inches.
- POPLAR CANADENSIS NOVA (the true variety), 12 to 16 feet, girth 6 to 7 inches.
- SYCAMORE, Common, 12 to 17 feet, girth 4 to 7 inches.
- .. Purple, 14 to 16 feet, girth 6 to 7 inches.
- THORNS, Double Pink, 8 to 10 feet.
- .. Scarlet, 8 to 10 feet.
- .. White, 8 to 10 feet.
- TULIP TREES, 8 to 10 feet.
- WALNUT, Common, 10 to 12 feet.

WEeping TREES.

- BEECH, Weeping, Pyramids, and Standards, 8 to 12 feet.
 - .. Weeping, Purple, Pyramids and Standards, 7 to 12 feet.
 - BIRCH, Young's Weeping, Pyramids and Standards, 8 to 14 feet.
 - .. Cut-leaved Weeping, Pyramids and Standards, 10 to 12 feet.
 - ELMS, Weeping, Pyramids and Standards, 7 to 14 feet.
 - LARCH, Weeping, Pyramids, 8 to 10 feet.
 - POPLAR, Weeping, Pyramids and Standards, 10 to 12 feet.
- Knap Hill Nursery, Woking, Surrey.

FERNS! FERNS!! FERNS!!! — Trade. In 25 most saleable kinds, at 12s. per 100. Large Adiantum cuneatum, fine tops, in 5-inch pots, 50s. per 100. Large Ferns, in variety, 45s. per 100, in 4's. Extra large Aralia Sieboldii, in 48-pots, 6s. per dozen, 45s. per 100. Packed free. Cash with Order.
J. SMITH, The London Fern Nurseries, Loughboro' Junction, S.W.

TREE CARNATIONS.—Duke of Clarence, new, the finest crimson-scarlet in cultivation, very large flowers; good plants, in 5-inch pots, 12s. per doz. Price per 100 on application. Carnation Souv. de Labryère, bright scarlet, remarkably free in winter; bushy plants, in 5-inch pots, 9s. per doz. Packing free for cash.
CRANE AND CLARKE, Hillside Nursery, March, Cambs.

GARDEN BULBS, ROSES, ETC.

Never has there been such a complete Catalogue issued of everything required for the garden as the one we are now sending post free; neither has there ever been such a splendid stock of best varieties of the many families of plants necessary to keep the garden in the highest state of perfection as we are now soliciting orders for. Our climate, soil, and fertility give us and purchasers many advantages, and we ask all to send for a Catalogue, and then

SWANLEY, KENT.

To those about to Plant.

A DESCRIPTIVE CATALOGUE of Roses, Fruit Trees, Conifers, Evergreen and Flowering Shrubs, Rhododendrons, Ornamental and Forest Trees, Clematis, and other Climbing Plants, in large variety, sent free on application to—
GEO. JACKMAN AND SON, Woking Nursery, Woking. Established 1810. Area, 150 Acres.

200,000 BERLIN LILY OF THE VALLEY CROWNS, strong and well-rooted, of own growth, and able to bloom, are for Sale this year by the undersigned. Price, per 1000, free on board, at Hamburg, 23 Marks. The advertiser begs to remark that he will forward only such crowns as have been grown in the very best ground, and that Berlin dealers are, by preference, buying his crowns for the Export Trade; but, as these dealers make, with respect to the price they pay, no difference between good and bad crowns, he has resolved to forward his crowns himself. He would therefore like to sell the above Lot to one firm direct, at the price quoted, and would remark that next year he will be able to supply 500,000 crowns.
Intending buyers are requested to apply as soon as possible to **FRANZ GOETZE**, Berlin, O., vor dem Stralauer Thor, 37, Germany.

AND YELLOW—IN ALL THEIR SHADES.*

RE-INTRODUCED BY

F. SANDER & CO.,
ST. ALBANS.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 26, 1891.

THE CHURCHTOWN GARDENS.

THESE well-conducted gardens, intended for the delectation of the people of Lancashire, are situated at Southport, a favourite watering-place, 15 miles north of Liverpool. The gardens were established sixteen years ago by a company, and their success speaks well for the management of Mr. Bull, and for the love of flowers and gardening prevailing among the industrial classes of this populous county. On high days and holidays many a black and smoky town, like Wigan and St. Helens, two of the most smoke-stained and sulphurous places in England, pours forth its pleasure-seekers in search of change and pure air, and many of them come to Southport and find their way to the Churchtown Gardens in such numbers that the Company, it is said, have reaped good dividends.

Mr. Bull showed myself and two friends over the whole establishment, within and without doors. In a charming garden of 7 acres, the visitors from mines and nether regions, delighting in flowers as they often do, but whose gardens at home must be limited in size, can here ramble among flower borders as artistically decked out every season, and through shrubberies as choice and well disposed as at Knowsley, Worsley, or Croxteth Hall. The chief attractions of the place are the gardens, with a lake for boating, a large conservatory, where a good band discourses sweet music from amidst the foliage of Palms and Tree Ferns; a fernery, and a very popular museum, well filled with objects connected with natural history, and refreshment rooms nicely decorated with handsome plants. The plants in the conservatory are correctly labelled, and among them are good specimens of *Araucaria Cunninghamii*, *A. excelsa*, *Chamaerops Fortunei*, and other exotics growing in pots or borders, and well selected for the purpose of exhibiting to unaccustomed eyes the gorgeousness of tropical foliage. To the majority of persons who visit this local watering place, the gardens at Kew are an inaccessible wonder-land, and the stately foliage seen in this conservatory is quite sufficient to surprise and delight them.

The greater part of the revenue of the gardens is derived from admissions, but there is another source of profit in the sale of fruits, flowers, and plants. Specimen plants are largely propagated, and are offered at such prices that the admiring colliers and other well-paid working people can no more abstain from purchasing them than a hungry fish can resist the bait. Good big pots of Maidenhair Ferns are sold at a very reasonable price, and attractive "hutton-holes," prepared by practised hands, are taken home in great numbers. It might be supposed that hundreds of colliers intended next day to descend

the shafts with flowers in their coats; but this is not the case. The little works of art and nature blended—that is the “button-holes,” are not destined to be hid under a bushel, or to waste their sweetness in a coal-mine, since they are purchased for exhibition at the numerous little flower shows which, in Lancashire, are held throughout the summer in the villages, when small prizes are awarded to successful exhibitors in the various classes. The Churchtown Gardens, therefore, may claim the merit of creating and extending a love of flowers, which refines and humanises all who come under its influence. Formerly, in Lancashire, the Gooseberry reigned almost supreme amongst the horticultural objects on which people bestowed thought and minute attention, and bloated specimens they were! But the big Gooseberry has now been, happily, dethroned, and a democracy of flowers, Roses, Pansies, Auriculas, Chrysanthemums, “button-holes” and many florists' flowers, have been established in its place. The art of floriculture has been long seated in Lancashire, but it has been greatly extended in our own times by such influences as those I have referred to, and by the opportunities of comparison and competition, which the more extended social intercourse of the time promoted.

In some cases, working-men of a practical turn have greatly increased their loaves and fishes by the culture of flowers for market. A collier, possessing a fine specimen of *Maréchal Niel* Rose on his wall, built a glasshouse over it, and now makes £28 a year of the Roses cut from this single plant; and as the Rose grows, he extends its house. Stimulated by modern influences, and aided by association, some of the colliers have become excellent botanists, and the interest that many of them take in the study of flowers may be recognised in the number of botanical societies supported by them at Wigan, Haywood, and elsewhere, and by the field excursions connected with these societies, when they become eager listeners to the lectures of the learned, some themselves playing the part of spokesmen occasionally.

Having referred to the sale of fruit and plants at the gardens, I must add, that in connection with this department, there are nine vineries filled with Hamburgs, Muscats, and Alicantes; six propagating houses for the growth of plants sold on the spot; a *Pelargonium*-house two *Tomato*-houses, and a *Rose*-house. There is also a nursery, where a considerable business is done in fruit trees and in shrubs, and such “stuff” as nurserymen usually dispose of.

The selection of Apples and Pears adapted to the district is assisted by an orchard, now in full bearing, and carrying a good crop of each of those fruits, which, however, can hardly ripen in a season like this, when clouds and rain and a low temperature have afflicted the country at a time when heat and sun are expected. Last year, ripe Apples and Pears were sold to the visitors on Bank Holiday, August 3, while this year, at that date, a month of fine weather was still required to ripen the same varieties.

Among the Apples which Mr. Bull recommends are *Cellini Pippin*, *Cox's Orange Pippin*, *Dumelow's Seedling*, *Emperor Napoleon*, *Golden Spire*, *Grenadier*, *King of Pippins*, *Lord Suffield*, *Lord Grosvenor*, *New Hawthornden*, *Stirling Castle*, and *Pott's Seedling*. Among Pears he prefers *Beurré d'Amanlis*, *Citron des Carmes*, *Hessle*, *Jargonelle*, *Louise Bonne*, *Marie Louise*, and *Williams' Bon Chrétien*. His favourite Roses are too numerous to mention. H. E.

NEW OR NOTEWORTHY PLANTS.

CUPRESSUS ARIZONICA.*

An interesting species, discovered on the mountains of Eastern Arizona in 1880 by the Rev. L. Greene, and subsequently by other travellers in other

FIG. 41.—CARNIVOROUS PLANTS: GLANDS OF *DROSERAS*. (Natural size, also highly magnified.) See Leader page.

A, part of leaf of *D. dichotoma*, natural size; B, single gland, greatly magnified; C, portion of stalk, more highly magnified; D, pigment cells on leaf; E, tips of glands in contact with insect, showing the fluid discharged, and the glands bent; F, gland of species of *Drosera*, showing also unicellular hairs of the leaf.

parts of the mountains of that state. Greene describes it as “a tall conical tree 40 to 70 feet high, with

* *Cupressus arizonica*, Greene, in *Bulletin of the Torrey Botanical Club*, May, 1882, vol. ix., p. 64; Rusby, in *Bull. Torrey Bot. Club*, ix., 29; Serrano Watson, in *Proc. Amer. Acad. Sciences*, 1883, xvii., p. 157; C. S. Sargent, *Tenth Census Report*, 1884, p. 180, as synonymous with *C. guadelupensis*, but this is doubtful (*M. T. M.*); Lemmon, *Third Report of the Californian State Board of Forestry*, 1890, p. 180.

horizontal branches, trunk 2 to 4 feet in diameter, covered with a dark red fibrous bark; bark of the branches flaking in thin plates, and leaving a smooth surface; branchlets stout and rather rigid, sharply quadrangular; leaves closely imbricated, very glaucous, neither pitted nor glandular [we find in cultivated specimens glands not infrequent], their margins entire, or in the very oldest denticulate; cones crowded on short stout peduncles, globose, about 1 inch in diameter, of six to eight very thick and strongly bossed scales; seeds numerous, 2 lines or more wide.”

The tree is, moreover, stated to be peculiar in that, while the bark of its trunk is shreddy, that of the branches is scaly, falling off in thin plates. The wood is described as light and straight-grained, splitting with the utmost facility, that of the heart being deep red, as in the red Cedar (*Juniperus virginiana*). The branchlets are said to bear so strong a likeness to those of *Juniperus pachyphloea* of Torrey, that without fruit they are hardly distinguishable. It is the principal tree to the north of Mount Graham, and forms dense forests, particularly on the northern slopes (Greene, *l.c.*) Parry and Palmer met with the same tree in the Sierra Madre, south of Saltillo, in Central Mexico. Serrano Watson, in commenting on the specimens collected by these botanists, doubts whether the species is really distinct from *C. Benthami*. The trunks of all the trees, says Lemmon, who found it in the Chiricahua Mountains, are 40 to 50 feet high, and retain the bark, which is greyish, of moderate thickness, and disposed in longitudinal ridges, dividing into sections a few inches in length by diagonal reticulations, producing a curious latticed appearance.

Judging from the specimens in the herbarium, and the plants growing at Kew, and in Messrs. Veitch's nursery, we should say that it differs from *C. Benthami* in its looser habit, more regularly divaricate or crossed branchlets, which are thus in four planes, and in its coarser foliage. It is nearer to *C. Lindleyi*, but differs in its looser habit, crossing branchlets, more fleshy leaves, which are more ovate and less sharply pointed than in the last-named species. From *C. guadelupensis* it differs in the crossing and more sharply four-cornered branchlets, whilst its leaves are deltoid and glandular, flatter, and not so convex; the cones, moreover, of *arizonica* are smaller. It is true that all these characters are subject to variation, but for horticultural purposes it is requisite to look upon plants from a rather different standpoint from that of the botanist, and if we find one form hardy and the others not so, we naturally attach greater significance to that point than a botanist would do. The young trees, as seen at Kew and Combe Wood, are of columnar or fastigate habit, resembling in this particular *C. Goveniana*, with loosely arranged, ascending branches; the ultimate branchlets form pyramidal masses or systems, they are markedly decussate and straight, and of about equal length. The foliage is glaucous, leaves about $\frac{3}{8}$ inch long, ovate, deltoid, bluish, glandular, straight-edged, as seen from the side. The cones are (in herbarium specimens) on short stalks, globose, about half an inch in diameter; the scales convex, with a prominent umbo or boss. The tree is perfectly hardy at Kew and Combe Wood, even after the last winter, a point again in which it differs materially from most or all the Mexican Cupresses. When shown at a recent meeting of the Royal Horticultural Society by Messrs. Veitch, it was deservedly awarded a First-class Certificate. M. T. M.

THE MOVEMENTS, SECRETION, AND STRUCTURE OF *DIONEA MUSCIPULA*.

At the recent meeting of the American Association for the Advancement of Science, Dr. J. M. Macfarlane made a communication on the above, of which the following is a brief summary of results, obligingly communicated to us by the author. He had noticed several years ago that two touches were necessary under ordinary conditions to cause closure of the leaf, and on more careful experiment

FIG. 42.—CARNIVOROUS PLANTS. GROUP OF DROSERAS: SUNDEWS. (SEE LEADER.)
A, *Drosera dichotoma*; B, *Drosera capensis*; C, *Drosera spatulata*; D, *Drosophyllum lusitanicum*.

since, he found that whether one only of the six irritable hairs was touched twice gently or strongly, or whether two were each once touched, the same result occurred. He then tried to ascertain how long influence of the first of the two stimuli would be retained by the protoplasm of the leaf-cells, and found that sharp memory-power, if it may be so called, was exhibited for fifteen seconds, that during the next forty seconds it became greatly weaker, and recollection of the first stimulus was greatly lost in sixty to seventy seconds. He showed the relation of this to Burdon Sanderson's and Page's results, and pointed out that the period between the two stimuli exactly corresponded to that "latent" period of muscular contraction in animals, though extended over a greatly longer space of time. But even three stimuli might be given before closure of an interval if less than about the one-fifth of a second elapsed between the first and second shocks.

It was further stated and demonstrated, that every part of the leaf-blade is sensitive, and closes after two gentle forceps snips, or after three if two of these closely succeed each other, also if the outer or inner surface be irritated. But if the first of the snip-shocks given be pretty strong, the memory of the protoplasm is intensified, so that even after the lapse of two or three minutes closure occurs on second shock. But while these are the simpler conditions, it was proved that an extremely powerful forceps shock, or strong jet of water, would at once cause contraction.

An interesting peculiarity, which the author considered could only be compared with the condition known as "contraction remainder" in muscular tissue, was demonstrated: a leaf, which had been closed, and was slowly opening, was gently pulled out further, and held for sixty to ninety seconds. It then remained rigidly open, but exhibited on stimulation all the above features, though in a rather sluggish manner.

The action of electrical and chemical stimuli was then described, the action of these being to indicate identity of behaviour in the leaf-cells with a neuromuscular cell in the lower animals.

Reference was then made to the nature and production of the digestive secretion, and gave reasons for considering that it might largely correspond to the waste materials excreted by contracting muscle.

After minute histological examination, the author stated that certain cells in the third and fourth layers next the upper surface showed an extremely fine waviness of the protoplasm, but on this point he desired to make further investigation. The description was rendered specially interesting from the presence of a beautiful lot of plants secured for the occasion by Mr. Oliver, of the Washington Botanic Garden, formerly of the Edinburgh Botanic Garden. On these plants the author demonstrated many of his results.

RORIDULA DENTATA.

ONE of the most remarkable of all the Sundews is that of which we now give illustrations (Fig. 43). They were taken from a plant growing at Kew, and now some 2 feet in height; but, in South Africa, it reaches a considerably greater stature, whilst its leaves are such efficient fly-traps, that they are hung up in the houses of the colonists for the purpose of abating the nuisance caused by the insects. It is a near ally of our common *Drosera*, differing from it only in slight technical details, but sharing its blood-thirsting propensities.

CATTLEYA LABIATA, LINDL.

THE re-discovery and re-introduction, after so long a period, of the genuine old autumn-flowering *Cattleya labiata* is one of the most interesting and important events to the horticultural world that has occurred for many years. Its continued existence in a wild state, notwithstanding all that has been written to the contrary, is now an assured fact.

The announcement in these columns on the 12th inst., that a magnificent importation of the true old autumn-flowering *Cattleya labiata* would be offered for sale by Mr. F. Sander, of St. Albans, who had re-introduced it from Swainson's original hunting-ground, came as a great surprise to most people, and we have it on good authority that on Friday last the sale-room presented such a scene as has seldom been witnessed, and that the whole of the 600 plants were disposed of to eager buyers. The announcement was assuredly sufficiently startling, for many have been the expeditions sent in search of the plant, and as so many had ended in disappointment, the belief gradually gained credence that it had been exterminated many years ago.

Much that is pure romance has gathered round the history of this magnificent plant, in which may be included the statement made last week, that while innumerable varieties of *Cattleya labiata* have filled our stoves, the true and original form, named after Mr. Cattley in 1821, has vanished. It may, therefore, be well to review somewhat critically the facts of the case.

Cattleya labiata was originally described and figured in Lindley's *Collectanea Botanica*, t. 33, where we are told that "this is another of the fine orchideous plants that were collected with our *Oncidium barbatum* by Mr. Swainson in the Brazils, and sent by him to Dr. Hooker. Our drawing was made by Mr. Curtis from a specimen which flowered in Mr. Cattley's stove last November. Without exception it is the handsomest species of the order we have ever seen alive." The date on the title page is 1821, but the work appeared in parts, and at intervals, so that the precise date of introduction must be sought elsewhere. We may also note that the *Oncidium barbatum* alluded to is figured at t. 27 of the same work. Lindley remarks that "for the figure of this new species of *Oncidium* we are indebted to Dr. Hooker. It was received by him, with several other fine orchideous plants, from William Swainson, Esq., who collected it during his residence in Brazil."

In 1825, a fine coloured plate of *Cattleya labiata* appeared in Hooker's *Exotic Flora*, vol. ii, t. 157, where appears the following note, evidently written by Mr. Cattley himself:—"The most splendid, perhaps, of all orchideous plants, which blossomed for the first time in the stove of my garden in Suffolk, during 1818, the plant having been sent to me by Mr. William Swainson during his visit to Brazil." Then follows a note by Sir W. J. Hooker:—"The individual here delineated is an offset from the parent plant just mentioned, and it flowered at the Glasgow Botanic Garden in November, 1824. . . . Mr. Cattley's plant was derived from the same source." There is also a dried flower in Sir W. Hooker's Herbarium, now at Kew, with the label, "Brazil, W. Swainson, Esq., fl. in Hort. nostr., 1819," from which it would appear that it flowered in the Glasgow Botanic Garden in 1819, the year after it first flowered with Mr. Cattley. From these facts it appears that the plant was sent to Cattley by Swainson, and first flowered in 1818; that Hooker's plant was an offset from Cattley's, and flowered during the following year, and that Lindley's original figure and description was prepared from a plant which flowered in Mr. Cattley's stove during November, either of 1818, or of one of the years immediately following. The only point which is a little contradictory in the two accounts, namely whether Swainson sent the plant to Cattley or to Hooker, is of very secondary importance. From Hooker's own account the former would appear the more probable, but from what Lindley says about *Oncidium barbatum* it is clear that Hooker did receive Orchids direct from Swainson, and if it could be shown that part of a clump so received was passed on to Cattley by Swainson's request, and part retained, there would be no conflict of evidence. He may, indeed, have sent to both, but against this must be set the statement that one was an offset of the other.

What is not stated is, where the plant was found growing wild, but it is known that Swainson's collections were made in the neighbourhood of Rio de

Janeiro, and the statements of Gardner, now to be considered, are sufficiently definite to settle this point. The latter first set foot in Brazil on July 23, 1836, at Rio de Janeiro, and soon afterwards made a series of excursions in the neighbourhood. From his *Travels in the Interior of Brazil*, second edition, published in 1849, the following facts are derived:—

"Near the sea," he writes, on p. 21, "and about 15 miles distant from the city [of Rio de Janeiro], rises the Gavea, or Topsail Mountain, so-called from its square shape, and well-known to English sailors by the name of Lord Hood's Nose. It has a flat top, and rises about 2000 feet above the level of the sea, to which it presents a nearly perpendicular precipitous face." A little further on (p. 22) he continues: "On the face of the mountain, at an elevation of several hundred feet, we observed some large patches of one of those beautiful large-flowered orchideous plants which are so common in Brazil. Its large rose-coloured flowers were very conspicuous, but we could not reach them. A few days afterwards we found it on a neighbouring mountain, and ascertained it to be *Cattleya labiata*. Those on the Gavea will long continue to vegetate, far from the reach of the greedy collector." Now comes the visit to the neighbouring mountain, just mentioned. On p. 23 he observes: "We made an excursion to a mountain called the Pedra Bonita, immediately opposite the Gavea;" and on p. 24, "Near the summit of the Pedra Bonita, there is a small fazenda, or farm, the proprietor of which was then clearing away the forest which covers it, converting the trees into charcoal. From the massive trunks of some of them which had just been felled, we obtained some very pretty orchideous plants." Finally, on p. 25, we read: "On the edge of a precipice on the eastern side [*i.e.*, of the Pedra Bonita], we found, covered with its large rose-coloured flowers, the splendid *Cattleya labiata*, which a few days before we had seen on the Gavea."

Let us now turn to Gardner's dried specimens, preserved at Kew. The label, in his own handwriting, is as follows: "It was with much difficulty, and no little danger, that I could obtain about a dozen specimens of this from the edge of a precipice on the Pedra Bonita Lymca. I collected, however, abundance of living plants. *G. G.*, Nov., 1836." The word "specimens," of course, alludes to pieces suitable for drying, two of which, consisting of pseudobulb with leaf and flower, are preserved at Kew, and these prove conclusively in themselves, as well as by their time of flowering, that Gardner's plant was identical with that of Swainson, as, indeed, they were determined to be by Lindley himself. It is significant that although Gardner subsequently visited the Organ Mountains, situated about 60 miles north of Rio, and other localities, and collected other *Cattleyas* and *Laelias*, he does not appear to have again met with *Cattleya labiata*.

Gardner's concluding words about the Pedra Bonita were truly prophetic: "The following year," he observes, on p. 25, "on my return from the Organ Mountains, I again visited this spot, and found that a great change had taken place. The forest, which formerly covered a considerable portion of the summit, was now cut down and converted into charcoal; and the small shrubs and *Vellozias* which grew in the exposed portion had been destroyed by fire. The progress of cultivation is proceeding so rapidly for twenty miles around Rio, that many of the species which still exist will, in the course of a few years, be completely annihilated, and the botanists of future times who visit the country will look in vain for the plants collected by their predecessors." How true have these words proved to the numerous persons who have sought for *Cattleya labiata*, after its value became fully recognised.

A few plants, however, have in some unaccountable way reached this country on at least two, and probably three, occasions, though the number of plants in cultivation has been so limited, that it has invariably commanded high prices. But it is often the unexpected which happens, and its re-discovery opens a new chapter in its history. The sale last week of a batch of 600 plants by Mr. Sander, at

FIG. 43.—CARNIVOROUS PLANT: RORIDULA DENTATA, MUCH REDUCED; FLOWER ABOVE, TO THE RIGHT, IS THE REAL SIZE. (SEE P. 366.)

Protheroe & Morris' rooms, is now matter of history, and as a matter personal to the writer is involved in its reappearance, we may conclude with a few remarks on a subject which has been many times alluded to in the horticultural press during the past twelve months, namely, whether my *C. labiata* var. *Warocqueana* (or *C. Warocqueana*, L. Linden) is or is not the true old *C. labiata*.

At the meeting of the Royal Horticultural Society held on May 13, 1890, a newly-imported *Cattleya* was exhibited by Messrs. Linden, of Brussels, under the provisional name of *C. Warocqueana*. As the flowers had opened on the journey from Belgium, and had only just been received from abroad, no opinion was passed upon it by the Orchid Committee. Two racemes, one with three, the other with five flowers, which had developed on the journey home, and expanded almost immediately the cases were unpacked, were sent to me, together with a living plant, two wild dried flowers, a photograph, and five coloured drawings, and I was requested to describe it. I replied that it was unquestionably a variety of *C. labiata*, but which one I could not possibly say from such a series of varied materials. I therefore counselled a little delay, until more characteristic flowers should be developed. Unfortunately, delay is impracticable when a large batch of plants is involved, and being urged to proceed, I wrote to an experienced member of the Orchid Committee, asking him if he thought the plant exhibited could be referred to any known variety; to which he replied in the negative, pointing out, however, that the plant was not properly developed. I therefore proposed the provisional name of *C. labiata*, var. *Warocqueana*, adding:—"The relation it bears to other forms of *C. labiata* is the more difficult to determine because of the range of variation it exhibits, and the absence of information as to its habitat, and must be left until the plant becomes fully established." (*Gardeners' Chronicle*, June 14, 1890, p. 735.)

On October 23 came two flowers from Mr. R. Johnson, gr. to T. Statter, Esq., Stand Hall, Whitefield, Manchester, whose resemblance to the old autumn-flowering plant at once struck me; and a few days later came others from Messrs. Linden, with a letter to the effect that the two could not be distinguished. All were from the same batch of imported plants, and I began to suspect that in some way there were two things mixed up. The plants, however, continued to be exhibited as *C. Warocqueana*, though a belief gradually spread, which was expressed by M. Lucien Linden in the *Lindensia* for February (t. 268), as follows:—"Part of the plants which flowered last year, from October until the early days of January, are not distinguishable from the ancient *Cattleya labiata autumnalis*." And the belief that the long-lost plant had reappeared was also expressed elsewhere.

The question which now remains to be answered is, whether the summer flowering variety *Warocqueana* is distinct from the autumn one? The living plant, received in May, 1890, carrying a raceme of three expanded flowers (now dried and carefully preserved), was presented to the Kew collection. This year it has made a good growth, and now carries a fine double sheath, which promises to flower about November. This seems to show that the summer-flowering was abnormal, and induced by the adverse conditions it was necessarily placed under during transit. The question can hardly be considered settled until the next flowers expand, and if it should prove that autumn is the normal season, there will remain the remarkable fact that two horticultural firms should have independently re-discovered a plant, which has been searched for over and over again, and both within a short period of each other. But reverting to Messrs. Linden's plant, it is remarkable that neither their collector, nor themselves, nor the Orchid committee, nor myself, should have recognised it. For some of us, at least, the time of flowering, the small undeveloped flowers, and the absence of knowledge of the plant's habitat, is sufficient excuse, but I distinctly remember that the

dried flowers (which, together with the drawings and photograph, had to be returned) were more like *C. labiata* than any of its varieties, and believe I mentioned this in my letter as an argument against its being considered a new species. Had I pronounced it to be the genuine old *C. labiata*, and flowering in May—but we may leave the reader to finish the sentence.

Now for the habitat! Well, I do not know it. Not Swainson's, clearly, which was almost certainly Gardner's; unless, as is, indeed, probable, it was still more common near Rio in 1818 than eighteen years later. But if the two importations just named represent the same plant, I have no doubt both came from Brazil, and, indeed, from no great distance apart, unless the species is more widely diffused than we suspect even at the present moment. It is also more variable than has hitherto been supposed, and the next year or two may witness some striking developments. From every point of view its re-appearance is one of the most important events that has been chronicled for a long period. *R. A. Rolfe, Ferndale, Lawn Crescent, Kew.*

JAPAN ANEMONES.

THE Japanese Anemone (*A. japonica*) and its varieties, are just now in the full flush of their autumn beauty. The genus is an extremely interesting and instructive one, because representatives of it are among our earliest spring flowers. *A. apennina*, *blanda*, *coronaria*, *fulgens*, *hepatica*, *nemorosa*, and others are beautiful in our gardens, and with one or two that flower later, carry on the season of bloom to midsummer; and then comes something like a pause, until *A. japonica* begins to flower in August with prodigality, and with its varieties *alba* and *intermedia*, the blooming season lasts till the early days of winter. I do not think that I ever before witnessed the autumn-flowering Anemones blooming so finely as at present; the wet summer appears to have caused the plants to make a very vigorous growth, and the size and substance of the flowers are in keeping with the robustness of foliage. The Japanese Anemone shares with the *Dahlia* and the *Chrysanthemum* the glory of furnishing the finest floral display of the waning year.

We have come to grow the white form so much in gardens, that the beauty and usefulness of what we regard as the type is in danger of being overlooked. It is of somewhat dwarfer growth than its white and rose-coloured varieties; and almost invariably twelve-petalled, thus imparting to the flower an appearance of semi-doubling. But they are narrower in width than the petals of the other two, and they have but nine each. I have seen them with fewer, but never to my knowledge with more, and indeed it seems as if the addition of another is not at all requisite. Both as near such simple beauty and perfection as seems to be necessary or possible, the small golden-green ball-like seed-vessel in the centre, surrounded by its frill of numerous deep orange stamens, appears to be quite in keeping with the winsomeness of its other parts; and then the freedom and continuity in flowering, as if it could not do too much in the way of floral service.

No one need be under any concern as to propagating it; it is much easier to propagate than to get rid of. Hundreds of creeping fibrous roots push their way below the surface of the soil, and throw out germs at all points, which in a short space of time make plants, and so a single plant soon grows into a large tuft. In making a plantation, a good deep loam is preferable, and it should be deeply dug and manured. It is practically impossible to lift the roots with soil adhering to them, and so when a plantation is made, the plants flower but sparingly. By the next season they are fully established, and they will go on flowering for years. It is so hardy that the hardest frost will not injuriously affect them. The flower-stems should be cut away in winter, when they have quite died down, and if some mulching of dung and leaves, or fertilising

vegetable refuse, can be then added, it will prove advantageous.

In planting let it be remembered that the type grows from 2 to 2½ feet in height, but the varieties 3 to 3½ feet. They should, therefore, be planted further back in the border, and indeed the white makes a good background for the species. *R. D.*

TREES AND SHRUBS.

NEW VARIEGATED DOGWOOD.

Those who wish to have one of the finest of all golden variegated deciduous shrubs should make a note this planting season of *Cornus alba Spathii*, which is by a long way the best of the variegated Dogwoods, and has no rival among any of the golden-leaved shrubs. I have seen it for the past two seasons, and have noticed that it does not become discoloured during summer as some variegated shrubs do, and even in a dull sunless summer as the present, it shows no tendency to become greenish. It is now largely propagated in the chief tree nurseries, as it is sure to be much sought for when the public know what a good thing it is, but let us hope that it will not be planted so lavishly and inconsiderately as the variegated Maple and other too-popular variegated trees and shrubs that give to gardens, especially small ones, the "spottiness" that is not admirable. *W. G.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

CARROTS.—If the soil is of a wet nature, these roots should be taken up forthwith, and stored, excess of moisture at this season causing them to split. In sandy soils, such as the Carrot delights in, the Horn varieties may be pulled up, but on heavy ones some of the soil must be previously removed from them with a fork. The tops should be cut about an inch from the crown, and the soil adhering cleaned off. The roots keep fresh if they are put up into ridges of sand or fine coal-ashes in a cool place out-of-doors. The roots, which should not be bruised, may be packed in layers, with the crowns sticking outwards; when the ridge is finished, some straight straw should be laid over the sides of the ridge, to prevent the soil, which will be put over the heap when hard weather begins, from touching them. This covering of soil may be 6 inches thick; and, if the ridge is a long one, a few bunches of straw may be stuck into the top of it, to allow of the escape of moisture. In this way, Carrots will keep good till late in the spring.

BEEETROOTS should be very carefully lifted, and stored before hard frosts occur. The roots of moderate size are those best liked, but if the colour is good throughout, a large root is as good as a small one. The method of storing the crop, is to select the best shaped roots, of the finest dark colour, sorting them carefully, so as not to break or bruise any; and, on an out-of-the-way border, lay them in rows, which is best performed by taking out a trench deep enough to hold the roots comfortable in an upright position. The roots may be laid along the trench, at about one inch apart. One trench being filled, the next should be opened, and soil should be turned into the first, and so on, till the job is finished, keeping the rows about one foot apart. The roots may be kept about 2 inches below the ground-level. A layer of dry tree-leaves, 8 inches thick, should be put over the ground in frosty weather, with enough light litter to keep them from blowing away. The leaves of the plant ought not to be removed, and when they are taken to the kitchen, they should never be cut off close to the crown. Beet may be stacked like Carrots, using earth instead of sand, &c.

MUSHROOMS.—The present is a good time to make up beds in the open air. The place should be sheltered from the east and north-east winds, and well drained, and the stable-dung prepared as for beds in the Mushroom-house, excepting that, as these beds contain more manure than those, greater care is needed to prevent the bed getting over heated, which would spoil the spawn. The materials being in readiness, the beds may be

made up, 4 feet wide at the base and 3 feet high to the apex, putting it up in sections of 10 feet at a time, spreading the materials along that length in layers, beating them firmly, and when one section is finished, another may be begun, and when the bed is of the required height, the sides should be dressed off smoothly, and beaten with a fork. In showery weather, the beds must be covered with tarpaulins or canvas, at the same time giving plenty of ventilation, or overheating may occur. As soon as the heat of the beds has declined to 80° or 85°, break up some good fresh spawn into pieces about the size of an egg, and put it under the surface, at 8 inches apart, making the beds quite firm after the disturbance. At the same time, or in a day or two, the beds should be soiled to the thickness of 1½ inches, beating it down with a clean spade, and covering it with long litter, and protect from rain as before; and as soon as it is seen that there is no longer danger of too great warmth being set up, a covering of Oat or Barley straw may be put over all, varying it in thickness according to the weather, from 9 to 12 inches being not too much in cold weather. Tarpaulins can be used over the straw, the heat will then be better maintained, and there will be less risk of cooling down by snow or rain. Early in December on a mild day examine the beds for produce, and place a little fresh litter directly on the surface in place of that which will have decayed.

LETTUCE AND ENDIVE.—Where the consumption of Lettuces and Endives is constant and regular, a good stock of large plants should be placed in frames or pits. Take up the plants with a ball of earth attached, and plant carefully, and wide enough apart to allow for growth without crowding, and tread the soil firmly and evenly about them, which will in a measure reduce the quantity of moisture in the frames later on. Unless frost threaten, or during heavy rains, the lights need not be made use of for the next two or three weeks. During very bright sunshine a little shade may be needed for a few days. *C. J. Waite, Glenhurst, Esher.*

FRUITS UNDER GLASS.

ORCHARD HOUSE.—Now is a good time to examine the early fruiting kinds standing in pots top-dressing or repotting then as may be required. Where the plants have grown to their full size, and no more pot-room can be afforded, the ball should be made smaller, the large roots should be shortened, the small fibrous roots being retained, the old soil being picked out with a sharp-pointed stick, and the ball of earth remaining thoroughly moistened, if dry, previous to repotting. Hazel or pasture loam, mortar rubble broken fine, bone-meal, and some wood-ashes, form an excellent compost for fruit trees. A rammer should always be used when potting, as it is found that a loose soil does not produce the best results. Any plants having few roots should be treated differently, their roots being cut back to a healthy part, and rather smaller pots made use of than those they have occupied; but it is a matter of doubt if much is gained by retaining any tree which has got into an unhealthy state, young trees being purchasable at a cheap price, which, if liberally treated, soon make up the loss, especially if they are Peaches and Nectarines. For orchard-house work, and where the chief supply of fruit is obtained from pot trees, a reserve stock should always be kept, for the supplying of fruiters in pots. Trees, after the repotting, may be stood out-of-doors plunged to the rim in coal ashes or gravel, taking them indoors a week or two before starting them.

FIGS IN POTS.—These, if well ripened as regards the wood, and the embryo fruits are showing, should, when required for early forcing, have all those that are larger than horsebeans pulled off as being useless, and only those just pushing retained. Repotting into larger pots, if this be required by the plants, should be done, employing for the work a heavy kind of loam, and using the rammer freely. I do not advocate a too free use of manure for Figs, its tendency being to produce too much leafage, and too few fruits. Liquid-manure is better, as it can be afforded the trees when it is most wanted, which is not at first—a top-dressing of Thomson's Vine Manure may take its place. At Syon the latter is used largely when the fruits are at their final stage, and a good dressing is afforded the trees as soon as the first crop of Figs is past. When repotting and top-dressing are finished, very little water will suffice during the rest period; but dryness of the soil must be guarded against. Pruning should take place before the potting of

large trees which have outgrown their space, being reduced in size by the removal of the naked and unfruitful wood. If scale be troublesome, the present is a good time to clean the trees, and if they are badly infested, painting the old wood with clay, tobacco-water, soft-soap, and sulphur is a safe remedy, if the last two substances are not used too freely. Cuttings of the ripened wood may be secured if an increase in the number of any variety is required, the cuttings soon putting forth roots in the early spring if potted up at this date, and wintered in a fruit-house or pit. *G. Wythes, Syon House, Brentford.*

THE ORCHID HOUSES.

Nothing adds so much to the enjoyment of a collection of Orchids as perfect cleanliness in pots, stages, glass, &c. In the country, a thorough cleaning of these twice or thrice in a year will be found sufficient, but in smoky localities it is required much more frequently, especially the glass, for when that is semi-opaque, as it soon becomes, flowers become small, weak, and they open badly. But little shading will now be required, unless it be for *Phalenopsis*; but where whitening or "Summer Cloud" have been used on the glass, they may be washed off, the simple shading being now sufficient. *Calanthe Veitchii* and *C. vestita* will require thick shading during strong bursts of sunshine, or the foliage will quickly die away, not only spoiling the appearance of the plants, but the flower-spikes and flowers also. The foliage should not die down until the flowers are about half opened. Liquid manure, in the form of guano, should be continued. Many growers of *Calanthe* cut off the supply of water when the spikes begin to push out from the side of the pseudobulb, but that is a thing I never do until nearly all the flowers are opened. *Vandas* should be placed in such a position in the house that they may be easily shaded from the sun, especially the strong-growing species. These always flower freely without being roasted in full sunshine, and if they are allowed to get full sunshine, the dark green colour so indicative of well-doing is lost. *Vanda Sanderiana* is flowering well here. The plant seems to prefer any degree of warmth and much atmospheric moisture during the growing season, and but little water during rest, which usually lasts from November to March. I have seen it mentioned that *Vanda Hookeriana* is shy to flower—those who have followed my advice in their treatment will, I think, hardly endorse this dictum. We have been successful in having many scores of flower-spikes, several of which have had three, and in one case four flowers each; and many plants are flowering for the second time this year. In a former Calendar I have named the conditions under which our plants grow, and I may further add that they are all grown in a stove facing due south; the plants are thoroughly syringed twice a day in winter, and sometimes three and four times in summer. The drying-off of these plants is undoubtedly a great mistake. *A. G. Catt, Parkfield.*

THE FLOWER GARDEN.

THE FLOWER BEDS.—At no time during this season have the beds looked brighter, or shown to more advantage than during the past fortnight; the colouring of the several varieties of *Alternanthera* is now at its best, and the zonal *Pelargoniums* *Henry Jacoby*, *Tom Thumb*, *Christine*, and the variegated *Manglesi* are full and rounded masses of varied colour, which are well contrasted with adjacent beds of *Ageratum Tom Thumb* (mauve), *Lobelia pumila* (magnifica) and *Salvia patens* (blue), *Calceolaria amplexicaulis* and *floribunda* (yellow), &c. It is, therefore, sad to contemplate what a change the first few degrees of early frost will occasion. Bearing this in mind, many people have made due preparations, not only in raising in May and June last the necessary number of the kinds and varieties of winter and spring-flowering subjects wherewith to replace the summer-flowering plants, but in planting *Golden Queen* and *Blue Perfection*, or similar varieties of the *Viola*, between the plants of silver-leaved and golden-bronze *Pelargoniums*, occupying a due proportion of the flower-beds when filling the latter. The *Violas* are allowed to extend their growth in September, and when frost renders the removal of the *Pelargoniums*, &c., necessary, these are carefully pulled up, so as not to disturb the roots of the *Violas*, or otherwise interfere with their gay appearance, levelling the slightly-disturbed surface as the work is proceeded with. Thus arranged the plants continue to flower, more or less freely, during the autumn, winter, and spring months, the intervening beds being filled with plants of the dark (*Harbinger*

and golden (*Cloth of Gold*) *Wallflower*, *Myosotis dissitidora* (*Forget-me-Not*), *Arabis*, *Aubrietia deltoidea*, common *Primroses*, *Daffodils*, *Crocuses*, *Snowdrops*, *Saxifraga umbrosa* (*London Pride*), *Saponaria calabrica*, *Silene pendula compacta*, *Hyacinths*, and *Tulips*. The bulbs being deeply planted, remain in the ground from one year to another, and in addition to saving a considerable amount of labour (a fact never to be lost sight of) in taking up and replanting the bulbs, as is practised in some places, they flower all the better by being treated in the manner indicated.

CLEARING THE BEDS.—As soon as there has been frost enough to destroy the beauty of *Heliotropes* and *Dahlias*, the removal of any plants of *Pelargoniums*, &c., which it is desired to save in some quantity should be carried out, taking up the plants, if the ground should be firm, with the assistance of a five-tined fork, so as to preserve some of the roots; these, with the top-growth, should be trimmed when taken to the potting-shed for potting. As fast as the plants are removed, dig the beds lightly, planting them with the various subjects of winter display. *Arabis* and *Aubrietias* may be planted almost close together, if plants are plentiful. Other plants need more space, from 1 foot to half a foot, according to habit and the amount of growth that they usually make. *Variegated* and *Golden Thyme* may be turned to good account in the beds, also *dwarf Lanarustus*, *Box*, *Golden Yews*, and such-like, if they can be planted, on a ground-work of *Cerastium*, *Sedum*, or *Pyrethrum*. *Periwinkles* intermixed with variegated *Ivy* also show to advantage. In the case of the carpet beds, we simply clear away all the tender plants as soon as nipped by frost, and level the soil. If the weather is dry at the time of setting the plants in the beds, water should be afforded to settle the soil about them. *H. W. Ward, Longford Castle, Salisbury.*

THE HARDY FRUIT GARDEN.

ROOT-PRUNING—It is quite time that note be taken of unfruitful trees intended to be root-pruned or lifted, when the time comes for such work. Proper materials should be got in readiness, so that there shall be no delay when once the work is begun. Most fruit trees may be root-pruned or transplanted at almost any age or size, although in the case of large or very old trees, it is better to do the work piecemeal, instead of all at one time. The best time for praning the roots of trees is towards the end of the month of October and during November, the soil being then still warm, and wounds on the roots are soon healed over, and the fibrous ones make a little fresh growth, the trees breaking into growth without any apparent check the following spring. It should also be at once decided what amount of new planting shall be done, and a selection made of the different fruits. If the planter is in doubt about any of the novelties, the present is the best time to visit a nursery, and see the trees in bearing.

BORDERS FOR PEACHES AND NECTARINES.—Those intending to plant *Peaches* and *Nectarines* on newly-erected walls, should shortly begin the preparation of the borders. The wall should not be lime-washed, as doing this prevents the heat penetrating the bricks, and a whitewashed wall is never so warm as one that is left of its natural colour. The border should consist at the bottom of plenty of materials, more or less according to the condition of the subsoil, and it is usually better for the trees if the border be raised several inches above the surrounding level, except the soil be light and overlies gravel; but where the climate is good for *Peach*-growing, it may be made on the level. As a beginning, a width of 4 feet will be ample, 2 or more feet of new soil being added to its width two years afterwards, or when the roots reach this distance, if the staple is unsuitable. Good pasture loam, with a fair sprinkling of mortar-rubble, wood-ashes, or burnt earth, and some bones broken small, well mixed, and made very firm, is a very suitable compost for the *Peach*. At *Mereworth*, *Peaches* and *Nectarines* thrive admirably in yellow marl, which has little or no fibre in it; to this some half-decayed manure is added, and the growth, although it is strong, usually ripens well, and produces fine dark-coloured *Nectarines*, and *Peaches* of good size, &c. *Filberts*, *Pears*, and *Apples* also succeed in this kind of soil.

Figs will require to have, when they are crowded, the spongy shoots cut away close to the point from which they have sprung, and the others, the hardier and better ripened, neatly secured to the walls. *Young Figs* will not ripen, and should be pulled off,

the embryo fruits at the extremities of the young shoots furnishing the fruits of next year. *Brown Turkey* and *Brunswick* are good useful *Figs* to plant, being excellent croppers, very hardy, and nice-eating fruits. *Fig* trees which may be growing with too much vigour should be lifted, or root-pruned, or the border restricted. Do not let manure come near the roots of too luxuriant *Figs*. *H. Markham, Mereworth Castle, Maidstone.*

PLANTS UNDER GLASS.

SHOW AND FANCY PELARGONIUMS.—The plants which were cut back after blooming will have broken well, if the proper treatment has been observed; and they should be shaken out of the old soil and repotted, before the young shoots have grown much, in turfy loam (three parts), decayed manure (one part), a 60-potful of soot to one peck of soil, and a fair proportion of sharp sand to keep the whole porous. Employ smaller pots for this shift than those they have been growing in, affording them another shift at a later date; slightly water them, letting the water drain away. Place in a greenhouse or light dry pit, and syringe the tops lightly in bright weather. The plants will require little more water until the roots commence to run through the fresh soil; but fumigation with tobacco or its preparations should be resorted to at short intervals, to keep greenfly in check.

ZONAL PELARGONIUMS.—Plants which are intended to bloom in the winter should now be placed in their flowering quarters, and not left out any longer in cold frames, there being great risk of the flower-trusses getting damaged there by damp. The best position to flower these plants during the winter is a low, narrow span-roofed house, running east and west, the plants will then get all the sunlight obtainable. Avoid crowding, and examine each plant before water is given it by tapping with the fingers, or otherwise examining them. The temperature may range from 50° to 60°, in accordance with the temperature outside. Admit air on all favourable occasions, and when the pots are well filled with roots, occasionally apply a fertiliser in a clear condition, alternating these waterings.

POT ROSES.—These should now be examined, and repotting done where it is required, but such as occupy pots sufficiently large, the soil in good condition, and the drainage perfect, no repotting will be needed, only frequent applications of clear manure-water. A good compost for pot *Roses* consists of a heavy fibrous loam, a sprinkling of bone-dust, and sufficient sharp sand to keep the mass open and allow the proper percolation of water; but where the loam is very heavy, it will be advisable to add one-sixth part of leaf-mould to the rest. The foliage should be kept clean and healthy, for should it drop too soon, the buds will be immature, and the flowers not of the best quality. *Tea Roses* which were forced in the spring will be found now to have a quantity of flower-buds set, and these, by placing the plants in a cool house, will expand freely, and be found very useful in the late autumn.

SOLANUMS which were planted out in the open should now be lifted and placed in suitable pots, preserving as many of the roots as possible, afterwards placing the plants in a cold frame, dewing them over with the syringe, and shading them from bright sunshine until the roots push forth into the new soil.

CARNATIONS.—All plants in pots should be brought under glass forthwith, or mildew may make its appearance on them. Place them in a light, airy house or pit, keeping them well up to the glass.

CALLAS—The earlier batch of these, which have been growing in pots during the summer, should now be taken indoors, and placed in a light position, affording them a plentiful supply of water at the roots, and an occasional dose of liquid-manure. In the case of plants which have been grown out in the open in prepared beds, these will have made strong growths, and may now be lifted, preserving as many roots as possible, afterwards placing them in a pit or cool-house, syringing them daily, and affording shading until they are established.

MISCELLANEOUS—By placing *Schizostylis coccinea*, in a house where there is a little warmth, it will furnish a quantity of blooms late in the year. *Deutzias*, *Lilacs*, especially *Charles X.* and *virginalis*, *Staphylea colchica*, *Kalmias*, *Hydrangea paniculata*, *Azalea mollis*, *Helleborus niger*, *H. angustifolius*, and *Miss Hope* variety, and other kinds of roots and shrubs, which are used in forcing, should be lifted early, as they then receive a check, which tends to early and free blooming. After potting, plunge them in the open, in *Cocoa-nut* fibre, or coal ashes. *R. Milner, Penrice Castle Gardens, Swansea.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

FRIDAY, OCT. 2 } Dundee Horticultural Association meets.
SATURDAY, OCT. 3 } Preston and Fulwood Society meets.

SALES.

MONDAY, SEPT. 28 } Dutch Bulbs at Protheroe & Morris' Rooms.
The Lease, Stock, &c., at the Peacock Nursery, Hammersmith, by Protheroe & Morris.
Dutch Bulbs, at Stevens' Rooms.
TUESDAY, SEPT. 29 } Clearance Sale of Stove and Greenhouse Plants, at The Mile Ash Nurseries, by Protheroe & Morris (two days).
Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY, SEPT. 30 } Dutch Bulbs, Azaleas, and other Plants, at Protheroe & Morris' Rooms.
Great Sale of Nursery Stock, at the celebrated Bagshot Nurseries, by Protheroe & Morris (three days).
Dutch Bulbs, at Stevens' Rooms.
THURSDAY, OCT. 1 } Nursery Stock, at the Chilwell Nurseries, Notts., by Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.
Imported Orchids, &c., at Stevens' Rooms.
FRIDAY, OCT. 2 } Important Sale of Orchids, at Protheroe & Morris' Rooms.
SATURDAY, OCT. 3 } Dutch Bulbs, at Protheroe & Morris' Rooms.
Dutch Bulbs, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—54°·9.

"A FELLOW-FEELING makes us wondrous kind." Was it some such feeling as this, we wonder, which sufficed to fill the auditorium at the Drill Hall on Tuesday last? Was it the blood-thirstiness of which our French friends accuse us? Was it a faint reflex of the interest excited quite lately by the exploits of the fasting man a few hundred yards distant? Whatever the cause might be, there is no doubt that a much larger audience than any we have seen before attended to hear Mr. LINDSAY'S lecture at the Royal Horticultural Society on Tuesday last. There were some disappointments over the business. We will confront them, and get them out of the way as soon as possible. First: Mr. LINDSAY was not present. His paper was so good and so comprehensive, botanically and culturally, that we can but regret he was not present to read it and receive the tribute due to him. Next, Mr. CASTLE not only obliged to absent himself, but left no trace behind in the shape of a paper. But in the eyes of the public—we mean the public not the initiate—the greatest deficiency of all was in illustration. If it had not been for a small collection shown by Messrs. VEITCH, the carnivorous among plants would not have been specially represented at all. When we remember how well these plants are shown by Mr. BULL, Mr. WILLIAMS, and others at ordinary shows when carnivora are not supposed to be to the fore, and when we call to mind the splendid collections at Glasnevin, Kew, and Edinburgh, we can but regret the *coup manqué*

that was played by the Royal Horticultural Society on this occasion, and still more that the exhibitors lost so good a chance. Could the authorities have foreseen that the subject would have "drawn" as it did, they would surely have exerted themselves more fully to secure an adequate representation. As it is, we saw, not only a great crowd of mere curiosity-seekers, and not a few irate sight-seers, but a distinct infusion of persons high in the world of science who had been attracted by the announcements and *communiqués* in the press. And the disappointment experienced was proportionate.

No such feeling could be felt in the case of Mr. LINDSAY'S paper, which, though only read in abstract, was recognised to be an admirable summary of our knowledge on the subject. Laughed at at one time, contested at another, the general facts are now known to be beyond dispute. Digestion of organic matter is not, as once supposed, confined to animals, but is shared by plants. A seed cannot germinate, nor an embryo root push its way from its starting point in the interior of the main root to the surface without the agency of a fermentative and digestive process such as the leaves of the *Droseras* manifest. But though the facts themselves are now the supporters and vindicators of a general theory, there are yet points of detail which are still open to question—still matters of hypothesis rather than of theory. Our French friends, for instance, attribute all the phenomena witnessed to the agency of bacteria.

The bacteria, as we know, excite fermentation, and are invariable accompaniments of putrefaction. They render soluble and efficient the insoluble and inert nitrogenous matters in the soil, they afford the Leguminosæ with a special means of obtaining nitrogen. The bacteria are sure to be present when any putrefactive action is going on, and no doubt they contribute their share to the general turmoil of the elements that is going on under such circumstances. Keep the bacteria away, and the phenomena witnessed by every experimenter heretofore will, doubtless not be observed.

Admitting all this, we do not see that the digestive process in plants can be denied, even if it be also admitted that Bacteria have their share in the work. On the contrary. "But," say the cultivators, "the plants derive no benefit from catching flies; rather are they damaged and caused to rot." Well, perhaps they are, in part; the fly-trap rots, but not before it has yielded up to the plant the nitrogenous matters it needs. Besides, in cultivation, the requirements of the plants are more efficiently secured than they would be in nature, and we know that while under natural conditions the roots of these plants are relatively small, under cultivation they become largely developed. Again, in Nature, the aim is to secure perfectly-formed seed, in which process chemical changes of complex character and stores of food are required. Under cultivation, the object is to produce good foliage and big pitchers—quite a different state of affairs. On the whole, then, we do not think the theory of the so-called carnivorous tendencies of plants are at all invalidated by the more recent researches to which we have on various occasions called attention, particularly as experimental research, not mere eye observation, has proved that the plants do benefit very materially from the administration of nitrogen in some form or another, and that if this be withheld the benefits do not accrue. Our illustrations this week are devoted to these so-called carnivorous plants, and show, at p. 361, the glandular apparatus by which

the pepsinous matter is secreted, which effects the solution of the organic matter in *Drosera*, as well as several illustrations of species of *Drosera*, *Roridula*, *Pinguicula*, &c.

Conifer Conferences, &c.

THE next event of the season in the horticultural world of London will be the Exhibitions and Conferences to be held at Chiswick next month. The following is the programme issued:—

An exhibition of Asters, Sunflowers, and Conifera will be held at Chiswick Gardens, on October 6, 7, and 8, 1891.

On October 6, 1891, a Conference will be held at 2 P.M., on Asters (*Michaelmas Daisies*) and Perennial Sunflowers, and the following papers will be read:—1. Opening Address, by Mr. J. G. Baker, F.R.S., &c., Chairman. 2. "The Genus *Aster*," by Professor G. L. Goodale, Director of the Botanic Gardens, Harvard University, U.S.A. 3. "*Michaelmas Daisies*," by the Rev. C. Wolley-Dod, M.A. 4. "Perennial Sunflowers," by Mr. D. Dewar. 5. "Culture of Sunflowers," by Mr. E. H. Jenkins.

On October 7, 1891, a Conference will be held at 2 P.M., on Cone-bearing Trees and Shrubs. Papers to be read:—1. "Opening Address on some Special Features of Interest in the Order of Conifera," by Dr. Maxwell T. Masters, F.R.S., &c., Chairman. 2. "Japanese, Chinese, and Californian Conifera," by Mr. H. J. Veitch, F.L.S., &c. 3. "Conifera as Specimen Trees and for Landscape Gardening," by Mr. G. Nicholson, A.L.S. 4. "Conifers for Timber and in Plantations," by Mr. A. D. Webster. 5. "The Decorative Character of Conifera," by Mr. Edmund J. Baillie, F.L.S. 6. "Conifera at Bicton, Devon," by the Hon. Mark Rolle. 7. "Conifers at Dropmore," by Mr. C. Herring.

On October 8, 1891, the Conifer Conference will be resumed at 2 P.M. Papers to be read:—1. Opening Address, by Professor Bayley Balfour, M.A., F.R.S., &c., Chairman. 2. "The Value in the British Islands of Introduced Conifers," by Mr. Malcolm Dunn, F.R.H.S. 3. "The Quality of Coniferous Timber as Affected by Sylvicultural Treatment," by Dr. Wm. Somerville. 4. "The Timber of Exotic Conifers Grown in Scotland: its Uses and Comparative Value," by Mr. D. F. Mackenzie. 5. "Fungoid and other Diseases of Conifers," by Professor Marshall Ward, M.A., F.L.S. 6. "Insects Injurious to Conifera," by Mr. W. F. H. Blandford, M.A.

Fellows of the Society are particularly invited to assist in making the Exhibition a great success, either by contributing specimens of Asters (*i.e.*, *Michaelmas Daisies*), Sunflowers, or of Conifera themselves, or by inducing others to do so.

Intending exhibitors may now obtain schedules and latest particulars of prizes offered, &c., at the Society's Offices, 117, Victoria Street, S.W.

In addition to the prizes offered in the schedule, awards will also be made to Coniferous plants plunged in banks or beds of cocoa-nut fibre. The fibre will be provided in the gardens.

Drawings or paintings in black and white, water or oil colours, &c., and any literature relating to Conifers will be much appreciated in connection with the Conference and Exhibition.

Prizes, if may be added, are offered for bunches of hardy perennials, Asters, and Sunflowers, to be competed for by amateurs exclusively; while for a collection of fresh cones with branches and foliage, the Veitch Memorial Medal and £5 are offered, also to amateurs.

It is greatly to be desired that planter and tree-lovers will take part in the proceedings; or, if that be not practicable, that they will send specimens of all kinds, and details relating to the rate of growth of various Conifers, their value for particular purposes, and their suitability to particular soils. In this way a great body of information may be got together, at present not readily accessible.

PAVILION IN THE GARDEN OF H. H. HUNNEWELL, ESQ., WELLESLEY, MASSACHUSETTS.

WELLESLEY, MASSACHUSETTS.—On various occasions we have given illustrations of this, one of the finest, if not the finest, garden in America. We now add another, showing a pavilion, overlooking the lake, and affording the luxuries of coolness and shade. The architectural features are simple but effective, while the clipped shrubs, generally to be deprecated, are in harmony with the vertical lines of the pillars. (See Supplementary Illustration.)

CATTLEYA LABIATA, TRUE AUTUMN-FLOWERING.—At the sale of Messrs. F. SANDER & Co.'s fine importation of this much-coveted species, on Friday, September 18, a refreshing revival, after the lull which always ensues during the holiday season, took place. The bidding was very spirited, and the amount realised for this *Cattleya* was £800. Not a single plant was left unsold, and many would-be buyers had to go away unsatisfied. We understand, however, that their wants will be supplied by a further consignment in grand order, which will be sold at Messrs. PROTHORPE & MORRIS' Rooms, 67 and 68, Cheapside, on Friday, October 2.

THE ROYAL HORTICULTURAL SOCIETY.—The new number of the *Journal of the Royal Horticultural Society* contains, besides extracts of proceedings, a number of interesting papers. Mr. W. WARREN writes on "Persian Cyclamen"; the Rev. W. WILKS on "Hardy Cyclamen"; Dr. M. T. MASTERS, F.R.S., on "Germination of Cyclamen." "Snowdrops," form the subject of papers by Mr. J. ALLEN, Mr. D. MELVILLE, and Mr. F. W. BURRIDGE. There are also papers on the "Cultivation of Hardy Bulbs and Plants," by Herr MAX LEICHTLIN; "Lachenalias," by Mr. F. W. MOORE; "Cape Bulbs," by Mr. J. O'BRIEN; and "Hybrid Rhododendrons," by Professor HENSLOW.

THE ROYAL HORTICULTURAL SOCIETY OF IRELAND.—A special council meeting of this society was held at the office, 189, Great Brunswick Street, on September 14. The following members of council were present: Sir Percy R. Grace, Bart., D.L., in the chair; Mr. H. Cusack, Mr. C. Strong King, J.P.; and Mr. Hamilton Drummond, Hon. Secretary. The secretary was instructed to obtain information regarding premises available for permanent buildings for the Society. Many annual members of the society were elected.

THE CLIMATIC CONDITIONS FOR THE DEVELOPMENT OF NICOTINE IN TOBACCO PLANTS.—It has been pointed out by Mr. A. MAYER that by the use of a rich and easily assimilated nitrogenous manure, the percentage of nicotine in Tobacco plants is increased. He has now been examining into the influence of climatic conditions—*e.g.*, heat, water, light, and the moistness of the air. Plants grown under glass contained in some cases double the percentage of nicotine found in those plants grown in the open, and consequently at a lower temperature; and in those plants grown under shelter a higher temperature corresponded with a higher percentage of nicotine. Full lighting was also accompanied by an increase in the nicotine contained in the plants—an increase which rose as high as 100 per cent. of that contained in plants from which the light was partly cut off. A small supply of water seems to be the most beneficial to full development, and an excess of water is inimical. By increasing the moisture of the atmosphere surrounding the plant, transpiration is diminished, and this leads to an increase in the amount of nicotine.

"HANDBOOK OF THE DESTRUCTIVE INSECTS OF VICTORIA"—Mr. C. FRENCH, the government entomologist of the colony of Victoria, has published the first part of a useful little book on the insects injurious to fruit trees in Victoria, and on "the methods to be adopted to check and extirpate them." Coloured plates of the American blight, the Codlin moth, the Apple-borer, the Apple bark-scale, the red spider, the Pear slug, the Pear mite, and other insects are given. The author fully acknowledges his indebtedness to the works of WESTWOOD, RILEY,

ORMEROD, MURRAY, and others, and has done his work conscientiously and well.

ORCHID-GROWING IN ENGLAND.—M. LUCIEN LINDEN, whose remarks on Orchid-growing in this country we alluded to on a former occasion, reverts to the subject in the last number of the *Journal des Orchidées*, wherein he asserts that his remarks applied more particularly to London and its vicinity. In future numbers, he is to tell us his opinion of the Royal Gardens, Kew, and of certain Orchid collections round Manchester.

"BOTANICAL MAGAZINE."—The plants figured in the September number are:—

Heritiera macrophylla, t. 7192—the looking-glass tree of India, by some supposed to be a large-leaved variety of the *H. littoralis*. There has been a fine specimen of the tree in the Palm-house at Kew for many years.

Tulipa Sintenesii, t. 7193.—This is the new species described by Mr. BAKER in our columns, 1891, vol. i., p. 330. Kew.

Citrus Aurantium, var. *Bergamia*.—The Bergamot Orange, t. 7194, a variety of the common Orange cultivated in Calabria for its oil. The specimen figured came from the garden of T. HANBURY, of La Mortola.

Impatiens mirabilis, t. 7195.—A remarkable species with an erect stem 4 feet high, and as thick as a man's leg, crowned with a tuft of many large, long-petioled, fleshy, spreading leaves nearly 1 foot long; and from the axils of which spring erect racemes of large yellow flowers. The plant came from Messrs. VEITCH, and is supposed to have come from the Island of Langkawi, off the east coast of Sumatra.

Phalenopsis Esmeralda, t. 7196.—Sir J. HOOKER includes under this species *P. antennifera*, *P. Ragnieriana*, and *P. Buyssoniana*.

HONG KONG—The *Annual Report of the Botanical Department* contains a notice concerning the origin of the Chinese preserved Ginger, which was lately attributed to *Alpinia Galanga*. Mr. FORD, however, holds to the opinion that it consists of the rhizomes of the true Ginger, *Zingiber officinale*, which is largely cultivated by the Chinese. About half a million of trees have been planted in the island, principally *Pinus Massoniana* (*sinensis*).

A NATURAL HYBRID CYPRIPIEDUM.—M. BARBEY has described and figured a hybrid between *C. calceolus* and *C. macranthum*. It appears that in Siberia the two species grow together. M. BOISSIER obtained from Siberia what were supposed to be roots of *C. macranthum*, but which produced flowers intermediate in character between those of the two species named. A comparative description of the two parents, and of the hybrid, accompanied by a coloured plate, is given.

FOREST OF BOX.—Near Antkjel may be seen the remains of an old Box-tree forest. This tree is now rare even in the Caucasus; a wood containing about 20,000 trees, ranging up to 2 feet in diameter, still stands at a higher elevation near Bship, but has recently been purchased by an English company for nearly one million dollars. A Box forest, says Dr. DIECK, in *Garden and Forest*, is the genuine forest of the fairy tales. "No soul can be so dull as not to feel its influence. Hardly a ray of sun can penetrate its thick roof of foliage; perpetual twilight and solemn silence reign within it. All the trunks, all the knotted branches, all the twigs are thickly covered with long trails of moss, while the dark soil beneath bears only a rare tuft of Ferns or group of shrinking fungi. No bird's voice is heard, no insect whirs through the air; only the rustling of the tree-tops and the moaning of the wind-twisted boughs breaks the church-yard stillness of this ghostly wood."

ARAUCARIA EXCELSA.—This neat and favourite plant for indoor decoration has long been extensively cultivated in Belgian and French nurseries,

and in a less degree in England also. Recognising its merits, Messrs. HUGH LOW & Co. have worked up a large stock, almost filling two long houses. The plants range from the young plant only a few inches in height, to the large specimen, but all are of perfect form, and, being evergreen, are available for use all the year round. It is not generally known that *Araucaria excelsa* is one of the very best plants for permanent use in the dwelling-house, and carefully tended, it thrives well even in the London smoke.

LILIUM WALLICHIANUM SUPERBUM.—Many plants of this grand creamy-white and yellow Lily grown under glass at Messrs. HUGH LOW & Co.'s nurseries at Clapton, display its beauty, but with these, as with most of this species which we see exhibited, the flowers are borne on very tall stems in consequence of their being forced, and the plant has acquired an unmerited character of being of ungainly habit. A large bed of it in the open ground at Clapton, and on which the buds are well advanced, shows it in its natural growth, its stature being 2 feet to 2 feet 6 inches—not an inch too tall to arrange well with the very large blooms borne on this Lily.

THE INFLUENCE OF SALT ON THE FOOD-RESERVES OF PLANTS.—The influence of salt on the quantity of starch contained in the vegetating organs of *Lepidium sativum* has been recently studied by Mons. P. LESAGE. He watered the plants with solutions containing from 1 to 25 grammes of salt per litre, and in the second series of experiments he employed sea-water in strength ranging from 4 to 100 per cent. With from 12 to 15 grammes of salt per litre, the starch disappeared completely from every part of the plant; but this disappearance of food-reserves is not directly proportional to the quantity of salt present in the water. In both series of experiments there was a minimum of salt in the leaves and roots when the plants were treated with water containing 1.66 grammes of salt per litre, or 67 per cent. of sea-water. Curiously enough, when stronger solutions of salt were used in watering the plants, the quantity of starch again increased until, when from 12 to 15 grammes was reached, the amount of starch, as already stated, disappeared altogether. It is not improbable that the real maximum is obtained by watering with solutions which contain a quantity of salt between 0.1 and 1.66 grammes per litre.

PALERMO BOTANIC GARDEN.—Professor, the Baron TODARO has lately issued another part of his illustrated folio record of interesting plants which flower in the Palermo Botanic Garden. The plants illustrated are *Aloe Rossi*, an ornamental species from Madagascar, with tufted fleshy, arcuate ovate-lanceolate leaves shortly and remotely toothed at the margin, and with a pyramidal raceme of nodding red and yellow flowers. *Aloe Lanzæ* has linear lanceolate leaves, with whitish blotches and deltoid marginal teeth. The inflorescence is more elongate and less pyramidal than in the first-named species.

THE DESTRUCTION OF SLUGS.—A recent number of *Cosmos*, referring to the slugs which, it states, are this year a veritable plague in the kitchen gardens in France, says, of all the hundred-and-one remedies which have been proposed to reduce these pests, none is so good as the "toad." The French gardeners used to kill the toad whenever they had the chance, as they had the mistaken and vulgar notion that they were harmful; they will now gladly pay a sou each for toads. In some districts, where toads are scarce, the gardeners are giving as much as three francs (half-a-crown) a dozen for these useful scavengers.

SYDNEY.—The *Agricultural Gazette of New South Wales* is publishing a series of illustrated articles on the grasses of New South Wales by Mr. TURNER, who also contributes articles on the weeds of New South Wales, and on new commercial crops (Liquorice, Manila, and Hemp). Various entomological articles are also contributed.

COUNTY COUNCILS AND TECHNICAL INSTRUCTION.—The Technical Instruction Committee of the County Councils have recognised the principle that the instruction to be provided shall be suited to the needs, and adapted to the industries, as far as possible, of the town or village concerned; thus, for example, in urban districts, such subjects are suggested as mechanics, building construction, steam, electricity, chemistry of common life, laws of health, &c.; and in rural districts, horticulture, agriculture, including bee-keeping, butter-making, &c. In Surrey, a syllabus has been printed of proposed horticultural lectures as follows:—1. Advantages of allotments and high culture of the land, (a) outline of general principles, (b) routine and results, (c) practical education. 2. The soil: its nature, preparation, and improvement, (a) erroneous and correct procedure, (b) implements and their uses, (c) essential parts of plants, flowers, fruit, seed, leaves, and roots. 3. Raising crops, plants, and trees, (a) from seeds, (b) by cuttings and layers, (c) preliminary remarks on budding and grafting. 4. The food of crops, and its influence on productiveness, (a) manures, their nature and application; (b) thinning, sustaining, and supporting crops; (c) rudimentary pruning. 5. Enemies of crops and trees, (a) weeds, (b) insects: grubs, their ravages, prevention, and extirpation; (c) advanced stage in budding, (d) grafting and pruning. 6. Planting vegetables and fruits, (a) mistakes pointed out, and correct methods described; (b) cultivation in the early stages of growth; (c) use and abuse of water and liquid manure. 7. Encouragement and endeavour, (a) prizes for gardens, and how to raise them; (b) exhibiting, (c) standards of excellence in vegetables, fruit and flowers; (d) judging. 8. Profitable crops, and how to produce them; (a) green crops, (b) small fruits, (c) advanced stages in culture and pruning. 9. Root crops and fruit trees, (a) cost and value, (b) qualities and varieties, (c) superior cultivation in gardens and fields. 10. Constituents of vegetables and fruits, (a) nutritive properties and uses, (b) aids to maturation, (c) summer-pruning, (d) root-pruning. 11. The preservation and disposal of garden produce, (a) fruits, vegetables, and flowers; (b) gathering and packing; (c) storing, (d) marketing. 12. High ideals in gardening, and how to attain them: (a) England to be the garden of the world, (b) its people, who work on the land, masters in the art of cultivation; (c) bright, full gardens, and happy homes!

PALMS, ETC., OUT-OF-DOORS AT PROSPECT HOUSE WOODFORD GREEN.—Palms and Cycads, &c., have been used during the summer with much effect at this place. The undulating grounds quite lend themselves to this form of decoration. Being sheltered as well, the gales of a week or so since did them little or no damage. Fine examples of *Chamærops robusta*, *Seaforthia elegans*, *Latania borbonica*, *Phoenix compacta*, *Cycas revoluta*, *Zamia*, and an *Aloe variegata*, some 15 feet high, arranged in commanding positions, give quite a tropical appearance to the garden, enhanced as it is with effective clumps, here and there, of *Acanthus latifolius*, *Caladium esculentum*, and *Cannas rubra* and *Gibsoni*. The variegated *Coltsfoot* has been used as a foreground to the *Cannas*, a position for which it seems well adapted, and *Castor Oil* plants look well placed singly about on the grass.

SOCIETY OF AMERICAN FLORISTS.—The next meeting will be held at Washington in 1892.

MR. CHAS. WHITEHEAD.—Our readers will hear with regret that Mr. C. WHITEHEAD, of fruit-growing fame, is suffering from the effects of sunstroke, but his illness is not considered to be of a dangerous character.

STOCK-TAKING: AUGUST.—The Board of Trade Returns for the month of August are of a very interesting character, and indicate a rise in the imports as compared with August last year, amounting to £1,423,382. Of course, articles of food figure largely, but the increase is distributed over some

half dozen other sections. As the Flax crop in Italy is reported to be a very favourable one, doubtless our Belfast and Dundee friends are looking it up. The following is extracted from the monthly summary of imports of foreign and colonial productions for the month compared with last year, and showing the difference:—

	1890.	1891.	Difference.
	£.	£.	£.
Total value for month	£31,422,897	£32,746,279	+1,423,382
§II.—(A.) Articles of food and drink—duty free	11,187,665	11,799,508	+611,843
(B.)—do., dutiable	1,998,108	2,113,185	+115,077
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)... ..	3,011,132	2,957,157	-53,975
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,137,800	4,436,652	+298,852
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	969,110	1,122,179	+153,069
(B.)—Parcel Post ...	32,106	38,781	+6,675

It may here be suggested that from one of our colonies at least a much larger supply of cereals ought to be forthcoming—we refer to Canada. The recently published results of the census taken in the Dominion this year are not at all satisfactory. There would appear to be a steady stream of emigration to Canada from the United Kingdom, and that the larger part of it makes for the United States as soon as possible. The agricultural population does not increase as it ought to do, and there is a tendency to flock from the field to the town. How much the Government—the conditions of existence—are to blame for this state of things we have not the space to dilate upon; but the fact remains, that the population is not what it ought to be by over a million (so it has been contended), and we do not receive from Canada the amount of food-produce which even under present circumstances she ought to produce and export. As was remarked in our pages a year or two since, we seem to be doing our best to educate young persons in order that the United States may reap the benefit of the education. A falling off of some 9 per cent. in the values of exports of British and Irish products has to be noticed; the decrease is exactly £2,147,120. Of course, this is greatly to be regretted—but there is peace in Chili, and "Brag" on the Continent has ended in a new Russian loan! So, possibly, there may be a better record for September. The figures in the following little table speak for themselves—they relate to the—

Imports of Fruit, Vegetables, &c., for August.

	1890.	1891.	Difference.
§II. Fruit:—			
Apples, raw bush.	138,270	116,763	-19,507
Unenumerated, raw "	675,893	975,137	+299,244
Onions "	339,219	261,009	-78,210
Potatoes cwt.	17,098	41,716	+24,618
Vegetables, raw, unenumerated value	£97,031	108,928	+11,897

In the matter of Potatoes, the London market record shows a range in prices from 46s. to 106s. per ton. A difference of 60s. is not to be altogether accounted for on the ground of quality; the untoward season and the fear of disease doubtless have had very much to do with the great range. Possibly first-class Potatoes have not been so cheap in the metropolis for years. The weather during the past month has been terribly trying for all kinds of crops—fruits, roots, and cereals alike; but agricultural conditions are slowly but surely altering in Great Britain. From a summary of the Agricultural Returns for 1891, issued the other day by the Board of Agriculture, it appears that there is but a slight increase

this year of land under cultivation, compared with 1890; the only noticeable increase is in Hops—the average here has risen just over 4 per cent., though still 2 per cent. under the acreage of 1889. The acreage under Potatoes has increased only 0.6 per cent., and the land under Barley has increased only 1600 acres, or less than a tenth per cent. on last year's acreage. The quantity of land under Wheat is still diminishing; in 1889, there were nearly 2,500,000 acres of Wheat—last year over 2,386,000 acres, but this year only a little over 2,307,000 acres. On the other hand it is to be noted that our wealth in cattle, sheep, and pigs, calculated in numbers at least, has uniformly increased. In Great Britain there are nearly 7 million head of cattle, 29 million sheep and lambs, and nearly 3 million pigs. This shows an increase of nearly 5 per cent. on 1890, and over 13 per cent. on 1889. The Board of Trade Returns month by month bear witness to the fact that we are becoming more and more reliant upon ourselves for live animals, which constitute a section by themselves.

ROYAL PRESENTATION TO MR. T. JONES.—We learn that the Queen has presented a silver tea service to Mr. JONES, Her Majesty's Head Gardener at Frogmore, on his relinquishing that post.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual dinner and gathering of members and supporters takes place at the Cannon Street Hotel, on October 15. Mr. G. A. Dickson, of Chester, and ex-Mayor, will be in the Chair.

SEAFORTHIA ELEGANS.—Mr. POLSON obligingly sends us a photograph of a fine plant of *Seaforthia elegans*, which has produced its flowers in his conservatory near Paisley. The tree is about 20 feet in height, with a diameter of 12 inches at the base. We may take another opportunity of alluding to the matter.

VANDA CÆRULEA AT TRING PARK.—Lord ROTHSCHILD'S gardens are famous, amongst other matters, for the perfection to which *Phalenopsis* and *Vanda teres* are grown. The house devoted to the last-named plant had recently upwards of five hundred flower-spikes. In the same house, *Vanda Hookerii* and *Aerides Vandarum* are grown, and the only specimen in cultivation of the true *Aerides cylindricum*, which is a very different plant from the *A. Vandarum*, which in some gardens goes under the name of *A. cylindricum*. The Tring Park collection now includes a houseful of the beautiful *Vanda cœrulea*, and it is anticipated that before the season is finished over one hundred and fifty spikes will be furnished by the healthy specimens of this species, which range in size from a single plant to masses of more than twenty stems. One variety has almost wholly bright blue flowers, with a dark blue labellum; another fine mass has four spikes, each bearing from fourteen to sixteen large flowers, in which the white ground of the segments shows through the rich blue veining. The finest specimen has seventeen strong flower-spikes, and will probably be the best ever seen.

PUBLICATIONS RECEIVED.—*Report of the Department of Agriculture, 1890-91.* Cape Town.—*Bulletin of the Botanical Department, Jamaica.*—*Trees and Flowers of California.* San Diego, California. The Orcutt Seed and Plant Company, substantially a trade list, but containing many interesting things, with notes on their growth, &c. It is a mistake to say *Abies bracteata* is unknown in cultivation. Mr. ORCUTT does not read his *Gardeners' Chronicle*.

THE REDWOOD.—One of the greatest curiosities of the Chicago World's Fair, says the *Times*, promises to be that sent by Tulare, California. A Redwood tree is growing there which is 390 feet high. It is intended to cut from this tree a log 90 feet long, and 20 feet in diameter. By cutting the log in half, and hollowing out each portion, it will be turned into two railway carriages, one fitted

up as a dining-car, with buffet, bath-room, barber's shop, and kitchen; the other to be a sleeping-car, with an "observation"-room. The rough bark of the tree will be left on for the roof, while the sides and ends will be of the natural wood, unpolished. The cars will be occupied during the exhibition by the families of the makers, and the rest of the tree will be cut up and worked into souvenirs.

chester. (2). The changes exhibited by protoplasm are much slower than your report would indicate. The effect of a current of London fog upon delicate, unprotected plant structures, takes some hours to manifest itself. The changes are identical with those occurring when sulphurous acid, of appropriate dilution, is passed over such structures. As the strength of the acid is increased, the effects in question are accelerated. (3). The concluding sentence

F. W. Oliver. [The report was furnished by a press-agency, and was unfortunately not revised. Authors would do well in such cases to send their own abstracts for publication, or at least to make known the fact that they are going to read papers on a particular subject.]

WHAT IS A HARDY PERENNIAL?—If "A. D." is right on p. 344, in classing *Hydrangea paniculata* as

FIG. 44.—CARNIVOROUS PLANT—PINGUICULA GRANDIFLORA: BUTTERWORT. (SEE P. 370.)

HOME CORRESPONDENCE.

TOWN FOG.—In the abstract, given on p. 340, of your last impression, of the recent discussion on "Town Fogs and their Effects" at the International Congress of Hygiene and Demography, some misleading statements are attributed to me. These I venture to correct:—(1). Sulphurous acid is conspicuous in both Manchester and London fogs; hydrochloric acid is present in both, though in less quantity in the London fog than in that of Man-

chester. It has been found necessary for the preservation of plants at Kew, as for the protection of legislators in the House of Commons, to filter the air through cotton-wool, and to supply the deficiency of light in foggy weather by electric illumination—represents the facts only as touching our legislators. Plants at Kew are without this sort of protection. The statement has doubtless arisen from the erroneous attributing to me, by a reporter, of remarks which fell from the lips of Sir Henry Roscoe, President of the Section in which the discussion took place. If I remember aright, the President was alluding to precautions which might become necessary in the near future.

hardy (I very much doubt if it is hardy so far north as this, even if grown as an herbaceous plant). I cannot agree with him that it should be called a "hardy perennial" in the ordinary sense of the words. "A. D." goes on to say: "If Roses and all ordinary hard-wooded shrubs which are not herbaceous, but are perennial, are excluded from classes termed hardy perennials, it can only be by some general understanding." I contend that such an understanding exists in the manner the term "hardy perennial" is generally applied. Who has heard of Rose trees or any other flowering shrub, say, *Dentzia scabra*, *Berberis Darwinii*, *Althæa*

frutex, *Cistus ladaniferus*, *Pæony Moutan*, Paul's Scarlet Thorn, and hundreds of other similar plants being called "hardy perennials." I admit that the term can be extended to include any plant that is perennial and hardy, but the fact remains that it is not usually so understood, but is taken by the majority of growers to mean a hardy plant that does not form a woody stem [above ground], and which, under the most favourable circumstances as to temperature, would still prove to be herbaceous. Granting that *Hydrangea paniculata* will succeed if treated as an herbaceous plant, the difference in the classes would soon be seen if a plant of it, and a plant of any ordinary herbaceous plant, say, for instance, *Delphinium formosum*, were lifted from the borders at the time when the latter commenced flowering, and grown on in a temperate house, the shrubby character of *H. paniculata* would soon appear as an absolute certainty, and its opponent would as certainly prove herbaceous. No shrub should be classed as an "herbaceous plant" or an "hardy perennial" in the ordinary sense of the term, and I consider the judges were quite right in the way they interpreted the schedule. To speak of "hardy herbaceous shrubs," as your correspondent does, is only to make confusion worse confounded. The terms "herbaceous" and "shrub" are exactly opposed to each other. *W. H. Divers, Kotton Hall Gardens, Stamford.*

NEW BRITISH FUNGUS.—The meeting of the Yorkshire Naturalists' Union, held during the past week at Doncaster, was devoted mainly to mycology. Of course there was the usual gathering of enthusiasts, a contingent of whom is always to be found haunting these fungus forays, at Doncaster to-day, at Paisley to-morrow, and in France, in Sweden, or in Denmark the next day—whispers were even heard that some might cross the Atlantic next year, "Just to see what the American species are like, you know." Old faces drop out from these meetings, but new ones appear to take their places—so wags the world. On September 17 an excursion was made to a wood near Doncaster—Sandbank Wood, I believe, is the name—when my friend Mr. H. G. Ward was fortunate enough to find a *Tilletia* not hitherto recorded as British. It occurs in the ovaries of *Holcus mollis*, and when once found cannot fail to be recognised by its markedly alveolate spores. It is doubtless the species described by Fischer von Waldheim under the name of *Tilletia Bauwenhoffii* (= *Polycystis Holci*, Westd.). Westendorp's plant, however, was on *Holcus lanatus*, but they are probably identical. The Doncaster plant occurred in considerable abundance. *Charles B. Plowright, M.D., King's Lynn, September 20.*

A NEW VARIEGATED FERN.—On a visit to the nursery of Messrs. Rogers, at Lodsworth, in Sussex, the other day, I saw, among other interesting things, a variegated form of *Adiantum macrophyllum*, which, so far as I know, is not in general cultivation, though it has been exhibited at one of the meetings at Westminster. As I saw it, with its fronds copiously mottled and freckled, I thought it a pretty plant, especially when the rose-tinted young fronds are likewise variegated. I am told that it is in best condition in spring, when the young fronds are freely developed. It will be a useful decorative plant, while among Ferns, it is most distinct, very different from any I have seen, and the floral decorator will, no doubt, put it to good use when it is obtainable. It is quite as strong in growth as the original, and requires the same treatment. There is an interesting collection of Orchids at this nursery, including some uncommonly good *Cypripediums*, notable among them being the best form of *C. barbatum nigrum* I have seen, and with larger flowers and deeper colours than ordinary. Outside one may see a thriving stock of several things which in that part of Sussex thrives admirably, one being the Japanese *Elæagnus pungens*, reflexa, and glaber, which are not generally planted, because insufficiently known, though they are among the handsomest of evergreen shrubs. *W. G.*

THE LATE MR WILLIAM HOLMES.—Soon after the death of Mr. Holmes, a committee was formed in Hackney to raise a fund for providing a local memorial of his worth, and the esteem in which he was so generally held. With the concurrence of his widow, this took the form of a handsome headstone in white marble, continued round the grave to a suitable height, so as to admit of the surface being planted with flowers. The upper portion of the headstone is finely sculptured, showing clasped hands, with the sentence below, "We shall meet again;" having representations

of *Chrysanthemums* above and at the sides in bas-relief; and at the top of each of the two dark granite columns which support the upper sculptured portion, a bunch of Primroses commemorative of his association with the local Primrose League. The inscription between the two columns set forth the date of Mr. Holmes' death, September 18, 1890, and goes on to state that, "This memorial was erected by a number of friends of the late William Holmes, as a token of their affectionate regard for his manly Christian character, and to mark their sense of his valuable services to the people of Hackney, as one of their most trusted and zealous representatives upon the various local boards; also in grateful remembrance of his unceasing labours in the world of horticulture, especially in connection with the culture of the *Chrysanthemum*." In spite of the very wet weather, a considerable number of friends were present at the Abney Park Cemetery, and, after a short service, conducted by the Rev. W. Langhorne, the Chairman of the Memorial Committee, the erection was formally handed over to the widow, Mrs. Elizabeth Holmes. Several members of the National *Chrysanthemum* Society were present, which was officially represented by the Chairman, Mr. Robert Ballantine, and the Secretary, Mr. Richard Dean. *R. D.*

POTATO POINTS AT EXHIBITIONS.—"One who Wishes to Learn" does not make his wishes very clear in respect to what he terms types of Potatos at exhibitions; but, presumably, he refers to their respective classes, as exhibitors have usually classified them. I was not at the Edinburgh show, and therefore did not see the Potatos, but, as I learn, large and coarse tubers were disregarded by the judges in favour of tubers of a more-refined character, and can very well understand the disappointment of those northern competitors whose notions with respect to show-tubers are, in some cases, indefinite. Generally, exhibition Potatos have been classified into white Kidneys and white rounds, coloured Kidneys and coloured rounds. In association with the two latter classes, however, it has been wisely agreed to include all having white skins, if only moderately blotched with any other colour. So much for the classification. I do not know whether that is what is meant by "One who Wishes to Learn," when he refers to types. It must not be understood, however, that it is easy to class all Potatos into these four divisions. White and coloured are clearly enough defined, but rounds and Kidneys are much confused, because we have so many sorts that are of undefined form, and being flattish-long, sometimes come in as round, sometimes as Kidney. However, in selecting varieties for distinct sections, the exhibitor should seek for those which seem most to conform to the requirements of the classes. Ashleaf Kidney, Snowdrop, Governor, The Canon, Magnum Bonum, with many others of the long, flattish, pointed form, are all true white Kidneys; and of coloured ones, Priz-taker, Edgcote Purple, Mottled Beauty, Beauty of Hebron, and others, show what sort of form these should have. Of white rounds, Schoolmaster, London Hero, Sutton's Seeding, and Satisfaction are all good types; and of coloured ones, Reading Russet, The Dean, Vicar of Laleham, or Adirondach are good examples. All other varieties may come into large collections of twelve, eighteen, or twenty-four dishes, when no special classification is stipulated. Still, in the case of these collections, they are strong or otherwise, just as they may include a fair admixture of colour amongst the whites, and of the recognised sections of Potatos; but of course it is more important that the individual tubers should be of the best form. This comprises good medium size, but not unduly large tubers, skins very bright, clean, and smooth, and the outlines as perfect and even as can be obtained. No tubers should have scab or roughness of skin, or abrasions or warts, but be what can conscientiously termed handsome. It is but right that as much beauty should be found in Potatos as the tubers can furnish, this, of course, irrespective of quality; but the term "Show Potatos," as commonly used, is misplaced, because all varieties, good or bad, give handsome tubers, just as grown in good or bad soils. Specially should the tubers exhibited be of fairly even size. After all, there is nothing like a good show to educate novices in Potato exhibiting, and one regrets that the bright International Potato shows no longer exist. *A. D.*

THE ELEPHANT'S FOOT.—TESTUDINARIA ELEPHANTIPES.—The tortoise-corm Yam, or Elephant's Foot, grown in pots, is a quaint-looking plant, and one that is only likely to be found here and there in

gardens. At the same time, there can be no reason why a lesson should not be taken from Cape Colonists, and the way they employ the plant for doorway decoration. At Port Elizabeth, they have been grown on house-porches for generations, and it need not be said, the huge, hard, outside coverings of the roots, prove permanently ornamental, as a base, whilst the annual growth from them, covering trellis-work with its neat foliage and yellow inflorescence, is at least, refreshing amidst the glare of sunlight and the prevailing dust—especially, when occasional rain storms cause them to glisten with renewed freshness. I would suggest match-pairs planted at the entrance of conservatories, or greenhouses (on the inner side of course), and indeed in cool ferneries they would prove a novelty, both as regards the rustic base and over-meeting growth, such as would be generally appreciated. Meantime, has it been ascertained whether these *Dioscoreaceæ* have any culinary merit? *William Earley.*

VEGETABLES AT GLENHURST.—When I looked in upon Mr. Waite at Glenhurst, Esher, Surrey, sometime since, he was very busy preparing his vegetables for the exhibition of the Co-operative Association at the Crystal Palace, where he exhibits annually in scores of classes; and also for a vegetable competition of a much higher status, perhaps the most important of any similar competitions in the provinces—that at Shrewsbury, on the 19th and 20th inst. A good deal of courage is required from any exhibitor who proposes to carry a quarter of a ton weight of vegetables so far from home as Shrewsbury is from Esher, and it involves likewise a considerable outlay. Still Mr. Waite has been there frequently, and found more or less success. His stoutest opponent there was Mr. Lambert, who however has, since last year, been called to Wales, where doubtless he will try hard to sustain his high reputation as a vegetable grower. Mr. Waite, however, is second to none with vegetables. It is true he sometimes finds his match, because with a show period of some five months, it is certain that occasionally some of his productions will be weaker than others. But few gardeners in the kingdom have a longer list of wins than he can show, and no other gardener, perhaps, attempts to show so often. The season begins in June, and ends with the latest of the *Chrysanthemum* shows, and during that time, perhaps, some twenty-five to thirty shows are competed at, and over one hundred prizes won. These latter, however, would not be of great merit were they seconds or thirds. Mr. Waite's average of firsts is very high, and such first-class results can only be secured by the best cultivation, and the highest capacity to select good products and set them up on the exhibition tables to the very best advantage. The large open space of ground taken from a rich meadow at Glenhurst, and converted into a kitchen garden, is every year fully cropped, and every year produces splendid results. It consists of a deep, friable soil, soft in texture, yet holding, in which all kinds of vegetables thrive. Then the very best selections are grown, and these are sown fairly thin, have ample room, and are carefully tended, so far as it is possible so to do. An instance of the exceptional care taken to secure the best possible samples is shown in some plants of Canadian Wonder French Beans, which have been hard-thinned to single plants, each 1 foot apart, on a south border, and these plants again reduced to single stems, and the production of a few pods, so as to ensure them straight and long. Celery, again, of the earlier planting, is blanched by means of bands of brown paper, and not with the soil. Not only is such method of blanching effectual, but it results in cleaner and finer stalks; still further, the finest can be selected and lifted as needed, whilst all the plants can be to the last freely supplied with liquid manure. Then with Cauliflowers, the greatest care is taken to have the plants tied up neatly, and not too closely, so soon as heads begin to show. The practice would not, perhaps, answer in wet weather, as it might too much enclose moisture, but in hot weather the effect is to keep the light from the heads, so that when cut they are of a pearly-white, very solid, and clean. For the season, more perfect samples of Cauliflowers than were at Glenhurst the other day could hardly be found. These simple things evidence the special pains taken by Mr. Waite to have the best, and to do all that can be done to secure the highest awards at the exhibitions. The chief subjects in vegetables shown at Shrewsbury from Esher comprised Autumn Mammoth Cauliflower, a fine stock turning in during August, and well in advance of the Autumn Giant; Excelsior Onions, very fine, and of cricket-ball form, still

capable of enlargement if left to grow; Snowball Turnip, the best of all for early show-work; new Intermediste Carrots, very handsome, clean, and rich in colour; Leicester Red Celery, very solid and clean; Exhibition Marrow Peas, a very prolific tall variety, which carries very fine pods; Satisfaction Potatoes, white, round, clean, and handsome; Ne Plus Ultra Runner Beans, a wonderful crop on the line, and the pods very straight, long, and of good colour; Model Cucumber, Globe Artichokes, Lyon Leeks, and Glenhurst Favourite Tomatoes, a very rich-coloured, handsome, prolific form of what is now the most popular vegetable-fruit grown. Beyond these, there are for extra dishes, if needed, Canadian Wonder French Beans, Exhibition Long-pod Beans, Parsnips, and Cabbages; but the expert exhibitor of vegetables knows well what are the best things for the season, and what should be winning samples. The gardener who has a good appreciation of the required quality knows at home so soon as his samples are clean and ready just about what his chances are in the intending competition. Few men in the matter of vegetables should understand what is good and what is not better than Mr. Waite, hence his oft successes, and high record of winnings. A. D.

SOCIETIES.

ROYAL HORTICULTURAL.

THE meeting on the 22nd inst., was very well attended by the public, and on this account it is to be regretted that only one small collection of insect-eating plants was brought. Mr. Lindsay's interesting paper on these plants was read by the Secretary, the Rev. W. Wilks, and was much appreciated. Messrs. Veitch had the only collection of insectivorous plants exhibited, consisting of *Nepenthes Burkei* excellens, with dark shining crimson pitchers with crimped rim; *N. Mastersiana* ×, mahogany-coloured pitchers, and others; also *Drosera dichotoma*, *Sarracenia Stevensii*, and others, many of which are figured in the present issue.

Orchid Committee.

Present: Dr. M. T. Masters, F.R.S., in the Chair; Mr. James O'Brien, Secretary, and Messrs. Sydney Courtauld, T. B. Haywood, E. Hill, Jas. Douglas, Hugh Low, F. Sander, L. Castle, and H. Ballantine. Messrs. F. Sander & Co., St. Albans, exhibited a small group of Orchids, comprising a grand dark variety of *Lælia grandis tenebrosa*, several forms of *Miltonia vexillaria*, including the variety *superba*, *Cattleya Gaskelliana alba*, *Vanda Hookeriana*, several plants of *Cypripedium Maynardii* × (*purpuratum* × *Spicerianum*), and three examples of the handsome *C. Pollettianum* × (*calophyllum* × *quantum superbum*) the wide difference between which, although the seeds came all from one pod, should act as a warning against naming slight variations, and especially colour differences. The great feature in *C. Pollettianum* is its large, perfectly circular dorsal sepal, which is quite flat. It partakes of the bright colouring of *C. quantum superbum*; the upper edge of the dorsal sepal is pure white and beneath the white margin, clear bright rose, the lower half radiating from the column having many lines and spots of shining dark chocolate. In one of the forms exhibited, the flowers were much paler than the type, and with but little marking on the dorsal sepal, and the other form had slightly larger flowers, in colour intermediate between the two. A Silver Banksian Medal was unanimously voted for the group.

Baron Schroder, The Dell, Egham (gr., Mr. H. Ballantine), exhibited *Cypripedium Antigone* (*niveum* × *Lawrenceanum*). Its flowers are as large as those of *C. Lawrenceanum*, but with much of the form of those of the other parent; they are white, tinged over the face of the lip and the sepals and petals with rose colour. A First-class Certificate was awarded. Mr. Ballantine also exhibited flowers of *Cattleya Hardyana* and *C. Dowiana*.

T. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), sent *Cattleya intermedia alba*, a variety with fine white flowers (First-class Certificate); *C. Loddigesii splendens*, with rich rosy-crimson sepals and petals, and distinct bronzy-orange stain on the lip; also cut flowers of *C. Loddigesii* and *Miltonia Moreiana atrombers*.

C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. G. Duncan), exhibited a plant of a light form of *Aerides Rohaniannum* and *Odontoglossum*

Pescatorei; and cut spikes of a very fine form of *Cattleya Schofieldiana* and *C. bicolor*, and of *Vanda Sanderiana*.

Messrs. Seeger & Tropp, 112, Lordship Lane, East Dulwich, staged a fine plant of *Grammatophyllum Seegerianum*, with a 4-foot scape of about three dozen flowers, greenish-white, heavily barred with brown.

Messrs. W. L. Lewis & Co., Chaseside, Southgate, sent a dark form of *Cypripedium Harrisianum* and a plant of *Masdevallia Gaskelliana*.

Captain Hincks, Brechinboro, exhibited his new hybrid *Masdevallia Stella* × (*M. Harryana* ♂ × *M. Estradae* ♀); the scapes are slender, and bear one pale lilac flower.

Messrs. Pitcher & Manda, the United States Nurseries, Hextable, Swanley, Kent, showed two plants of the pretty lilac-coloured *Lælia Eyer-manniana*, a fine form of *Cattleya maxima*, *Burlingtonia fragrans*, *Cypripedium Harrisianum* ×, and the darker *C. H. Rougerii* ×, *C. Chas. Canham* ×; and, under the name *C. intermedium* ×, a variety with much resemblance in the flowers to *C. selligerum* ×. A vote of thanks was recorded.

J. C. Parr, Esq., Grappenhall Hayes, Warrington, sent a three-flowered spike of *Cattleya Hardyana*.

Fruit Committee.

Present:—Philip Crowley, Esq., in the Chair; also Messrs. Harrison Weir, R. D. Blackmore, T. Francis Rivers, J. Cheal, G. W. Cummins, W. Warren, T. J. Saltmarsh, A. H. Pearson, A. Dean, W. Bates, George Cliffe, George Wythes, James Hudson, F. Q. Lane, H. Balderson, G. Reynolds, J. Willard, Dr. Hogg, and Rev. W. Wilks.

A Silver Banksian Medal was awarded to Messrs. William Paul & Son, Waltham Cross, for collection of sixty dishes of Apples and sixty dishes of Pears, comprising all the best kinds, large and well coloured *Souvenir du Congrès* and *Clapp's Favourite Pears*, *Duchess's Favourite*, *Duchess of Oldenburgh Melon*, *Lord Suffield* and *Emperor Alexander Apples*, &c.

Two dishes of *Solway Peaches*, fruits 4 to 5 inches in diameter, beautiful chrome-yellow, flushed red, were exhibited by the Rev. L. R. Flood, the Rectory, Merrow (gr., Mr. J. Gillart). Awarded a vote of thanks. The same acknowledgment was given to Mr. John Roberts, the Gardens, Tanywlch, for dish of *Passiflora edulis*, fruits the size of large Plums, of dark purple colour.

Vote of thanks was passed to Messrs. James Veitch & Son, Chelsea, for a Crab Apple called *John Downie*, nicely-coloured, fruit of *Pyrus malus*, × *Elise Rathe*, with pendulous branches, and conical medium-sized fruit, green with red cheeks; *Farleigh Prolific Damson*, with enormous crops of fruit.

Rev. W. Wilks exhibited a new Pear, *Marguerite Marillat*, 6½ inches long, 4½ inches largest diameter, pale yellow with russet dots.

Mr. Bloxham, Great Brickhill Manor, Etcchley, received a vote of thanks for some samples of *Veitch's Main Crop Onion*, 4 to 5 inches in diameter, flat and even, small neck and heavy. H. Lane & Son, Berkhamstead, showed a small pear-shaped Apple.

Messrs. Rivers & Son, Sawbridgeworth, had four dishes of seedling Plums which had been dried in *Mayfarth & Co.'s Fruit Evaporator* at Chiswick Gardens.

Three seedling Melons, as well as new Apples and Plums, came from various raisers, but these received no award.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. C. T. Druery, R. Dean, B. Wynne, G. Phippen, G. Nicholson, C. Jeffries, G. Mynton, R. E. Lowe, T. J. Bennett-Poc, H. Cannell, C. Noble, J. Walker, J. Fraser, W. Goldring, G. Gordon, and Rev. Honeywood D'Ombraim.

Mr. J. Walker, nurseryman, Thame, Oxon, received a Bronze Banksian Medal for a large collection of German quilled Asters, the most attractive being *The Bride*, white, surrounded with pink; *Modesty*, white, shaded with pale pink; and *Duchess of Edinburgh*, rose, white centre. They were shown in small shields, with their own foliage.

Messrs. J. Veitch & Sons, Chelsea, had a varied and interesting collection of plants. A greenhouse *Rhododendron*, *Ceres*, chrome-yellow self, carmine stamens; received a first-class Certificate. They showed six baskets of different *Elæagnus*, *E. pungens maculatus*, leaves with pale yellow centres, and narrow green margins, received a first-class Certificate. *E. p. aurea marginata*, with broad golden edge, was good.

Messrs. Pitcher & Manda, Hextable, Swanley, showed pins of *Cuphea Llave*, with two upper perianth

segments brilliant scarlet, which contrast with purple hairs on stamens. Awarded a Botanical Certificate.

W. Marshall, Esq., Bexley, received a Cultural Commendation for a large pot of *Nerine flexuosa*, the mass of deep pink flowers being effective.

A Silver-gilt Flora Medal was awarded to Mr. George Phippen, nurseryman, Reading, for handsome bank of flowers, consisting mainly of *Cactus Dahlias* in shields backed with *Bracken Fern*, also *Lilium lancifolium* and *L. auratum* in pots, the colour relieved with *Asparagus plumosus*, *Grevillea robusta*, *Cocos Weddeliana*, tall *Dracænas* at the back, and *Adiantum* in front.

Messrs. William Paul & Son, Waltham Cross, received a Bronze Banksian Medal for an important collection of autumnal Roses, filling six boxes, shown in clusters. The best of them were *Ulrich Brunner*, *Grand Mogul*, very good; *Mrs. J. Laing*, Duke of Wellington, and *A. K. Williams*. Teas: *Marie Van Houtte*, *Sunset*, *Niphetos Safrano*, Dr. Grill.

Dahlias.—Mr. St. Pierre Harris, Orpington, Kent, had three seedlings, viz., *Draughtsman*, crimson, flushed on the edges with orange-salmon; very fine shell petal-centre, and excellent outline (Award of Merit); *Mariner*, deep crimson, shaded with purple on the edges; and *Lancer (fancy)*, blush, the sides of the petals yellow, the reverse cinnamon; a pretty and lively looking flower, something in the way of *Polly Sandell*.

Mr. A. Rawlings, florist, Romford, staged a very fine collection of nearly two hundred show and fancy varieties, and, in not a few cases, three blooms of each. Of new varieties, he had *Mrs. Ocock*, yellow, slightly tipped with salmon red, and having a slight margin of pale mauve to some of the petals—very distinct and promising (Award of Merit); *Mrs. Hurst*, a pale variety, in the way of *Queen of the Belgians*, but paler in the ground colour, and being edged with a very slight beading of bright rosy purple; *George Gordon*, a bright crimson self; *Fred Gunston (fancy)*, deep lilac, flaked with maroon; *Nicol Walker (fancy)*, deep buff-yellow, striped with crimson; *George Arnold*, crimson, flushed with purple; and *Arthur Ocock*, a large orange-red self. Of older varieties he had, in very good condition, *Queen of the Belgians*, *Harry Keith*, *R. T. Rawlings*, *Shirley Hibberd*, *John Hushaw*, *Majestic*, a novel and attractive flower; *Nellie Cramond*, and others.

Mr. J. T. West, gr. to W. Keith, Esq., Cornwalls, Brentwood, staged a collection of new *Cactus* varieties, that were not in sufficiently good condition to tempt the Floral Committee to make an award to any of them: they were *Mrs. Harwood*, orange-scarlet; *Mr. Rolfe*, deep orange; *Emily Girdlestone*, orange, suffused with red; *Glory of Brentwood*, crimson, the points tipped with pale purple; and *Annie Goddard*, pale yellow. Mr. West had bunches also of older varieties, and a large collection of cut show *Dahlias*, including nine blooms of his fine new yellow self, *William Powell*. His blooms were very fine for this late part of the season.

Mr. G. Humphries, florist, Chippenham, had a collection of *Dahlias*, including six blooms of Mr. G. Humphries, a very attractive, light variety, flushed with warm pink, and slightly tipped with purple on the centre florets—very constant, and of fine quality (Award of Merit); and *Pompon Little Sarah*, buff ground, heavily tipped with rosy-pink (Award of Merit).

Mr. Turner, Royal Nursery, Slough, sent a collection of show *Cacti* and *Pompon Dahlias*; of the former, the following new varieties were staged:—*Ada Rhan*, soft pinkish-lilac, in the way of *Clara*, but deeper in colour, the petals more erect; very pleasing indeed, and novel, six very good blooms being staged (Award of Merit); *Touchstone (fancy)*, shaded yellow ground, striped and flaked with crimson (Award of Merit); also *Nugget*, yellow, heavily tipped with reddish-orange; *Edorado*, crimson, tipped with purple; *Hero (fancy)*, pale lavender ground, heavily flaked and striped with crimson; *Oliver*, crimson self; *Old Tom*, a lightly shaded crimson self, of great promise; *Lorina*, deep buff yellow, &c. Of new *Pompon* varieties, *Mars*, rich bright scarlet, small and of the finest form (Award of Merit); *Lorna Doone*, pale lilac-rose ground, heavily tipped with claret-crimson, perfect in shape (Award of Merit); *Cecil*, ruby-red, tipped with white, finest shaped petals (Award of Merit). Beside these were six new *pompon* varieties, viz., *Marion*, *Othello*, *Rubens*, *Midget*, *The Mikado*, and *Martial*, all very fine.

Messrs. Cannell & Sons, nurserymen, Swanley, staged several bunches of new *Cactus* and decorative varieties, viz., *Ernest Cannell*, very pale bright

orange-scarlet, true Cactus type (Award of Merit); Sir Roger, brilliant orange-scarlet, true Cactus type, a most striking variety (Award of Merit); Mrs. Thornton, the base of the petals warm bright rose, the greater portion of the petals bright deep rosy-pink (Award of Merit); Beauty of Eynsford, salmon, flushed with reddish-orange and yellow; Marchioness of Abergavenny, pale yellow; Princess Christian, bright rose, flushed with magenta-purple on the edge; and some few other good varieties.

A large representative collection of Dahlias came from Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley. There were forty-eight bunches of single varieties, including several quite new, such as Lady Whitehead, deep rose, a peculiar and novel shade of colour; Gertrude, pale mauve-purple edged with silvery-mauve; Cleopatra, fiery-crimson shaded off to maroon-crimson; Miss Sperati, yellow, flushed and striped with deep red; Duchess of Albany, Alba perfecta Christine, a very pleasing shade of pinkish lilac, &c. single blooms, and large and imposing bunches of Cactus and decorative Dahlias, such as Lady Marcham, Empress of India, Juarez, Marchioness of Bute. These and thirty-six show Dahlias completed the large-flowered part of the exhibit. There were also thirty bunches of pompon Dahlias, some of the most pleasing being Dora, Janet, Admiration, Eurydice, Favourite, Guiding Star, Phoebe, E. F. Jungker, Elie Meillard, white; and Blanche.

Next to this Mr. T. S. Ware, Hale Farm Nurseries, had arranged an imposing pyramid of Cactus and decorative Dahlias, which, despite its formality, had attractiveness for many. The group included Delicata, tinted-blush, very nice; Oban, salmon flushed with mauve; John Bragg, rich maroon; Edmund Weekly, Mrs. Douglas, &c. Also a number of pretty bunches of Pompon varieties, comprising several new sorts, such as Mrs. Walter Besant, pale buff, tipped with purple, very pretty (Award of Merit); Nellie Macbray, deep orange-buff, very novel and distinct (Award of Merit); Edith, white slightly tipped with purple, very pretty and delicate; Rose Perry, pale yellow, edged with claret; and others. Also bunches of single varieties, a lot of plants in pots of his new white Carnation La Neige, which seems to improve as the summer wanes; and a collection of pretty bunches of early flowering pompon Chrysanthemums, foremost among them being Toreador, yellowish buff; Anastasio, pinkish-lilac; Précocité, Early Blush, &c.

Mr. Ware had some plants of new early-flowering Japanese Chrysanthemums. Mr. W. Whiteley, The Nursery, Hillingdon, again sent his new white Japanese Chrysanthemum, Miss Whiteley, but not improved in appearance. Lastly, came Mr. R. Owen, Castle Hill Nursery, Maidenhead, with a large and representative collection of early-flowering Chrysanthemums, Pompon and Japanese, including seedlings of his own raising, and new continental varieties. There were twenty bunches of selected early Pompons; several new Pompon varieties, such as Madame Edouard Lefort, fimbriated yellow; Viscount Cliquot, deeply yellow, with slight flush of orange-red; very compact and pretty (Award of Merit); G. B. Duvoir, bluish-white (Award of Merit), &c.; also a large collection of new early-flowering Japanese varieties, including M. Pynaert Van Geert, deep brownish-gold; R. du Mesnil du Mont Cheauve, blush and deep lilac-rose, Middle Louise Morlot, blush, suffused with purplish-rose; N. Molyneux, a seedling from E. Molyneux, but with the surface fiery-chestnut, with silvery reverse; Lady Emily Fitzmaurice, bright yellow; Autumn Queen, resembling a deep golden form of Madame Desgranges; Mrs. Burrell, sulphur; M. Merendet, deep pink.

STOWMARKET HORTICULTURAL.

This Society, after being dissolved twelve years ago, through lack of funds and other reasons, has been reconstituted under the presidency of Mr. R. J. Pettivard, a large number of local gentlemen being appointed vice-presidents, and a strong committee having been elected, a successful show was held on September 4. In the fruit classes, competition was not very keen, except for Plums, Apples, and Pears; nor for vegetables, except Potatoes and Onions, the former of which were exceptionally fine and good, more especially the cottagers' productions.

The Rev. E. J. Warmoll kindly offered special prizes for vegetables grown on his allotments, and as a great many of the exhibits in the ordinary cottagers' classes were from the same allotments, this gave additional chances of finding a place in the

winning list. There were two classes for honey, comb and extracted, and some excellent 1 lb. and 2 lb. bottles were shown.

ROYAL CALEDONIAN HORTICULTURAL INTERNATIONAL

SPECIAL AWARDS FOR EXHIBITS NOT IN COMPETITION.

[We publish this list subject to correction, as it is we believe still incomplete, and the official record has not even yet reached us. Ed.]

A Gold Medal was awarded to Messrs. Wm. Thomson & Sons, Tweed Vineyard, Clovenfords, Galashiels, for a table 60 feet by 14 feet, composed of choice Palms, Orchids, Ferns, fruit, cut flowers, and vegetables, remarkable for good culture and tasteful arrangement.

The following were awarded Silver-gilt Medals:—

The Royal Horticultural Society, London, per Mr. Barron, Chiswick, for an interesting and instructive display of fruit, consisting of sixty-two varieties of Apples, twenty-five varieties of Plums and Damsons, and seventy varieties of Tomatoes.

Messrs. Geo. Bunyard & Co., Maidstone, Kent, for a first-class collection of fruit, made up of forty-six dishes Apples, twelve dishes Pears—all beautifully coloured—and two dishes Kentish Cobs.

Mr. Walker, Ham, Surrey, for a collection of Apples and Pears from standard trees; there were sixty samples of Apples and thirty samples of Pears, all large and good.

Messrs. Birkehead, Sale, Manchester, for a rich and interesting display of Ferns, many rare, and all beautiful.

Messrs. Cannell & Sons, Swanley, Kent, for a splendid display of Tuberous Begonias, Cactus, Dahlias, &c.

Messrs. James Dickson & Sons, nurserymen, Hanover Street, Edinburgh, for a choice collection of ornamental Conifers.

Messrs. B. S. Williams & Son, Holloway, London, for a table of stove and greenhouse plants, comprising many new and rare species and varieties.

The following were awarded Silver Medals:—

Messrs. Cheal & Sons, Crawley, Sussex, for a fine collection of sixty dishes of Apples, and thirty dishes of Pears, along with a numerous exhibit of Dahlias and other cut flowers.

Mr. John Watkins, Pomona Farm, Hereford, for eighty dishes of Apples, forty dishes of Pears, twenty of Cider Apples, and twelve of Perry Pears, thirty of Plums and Damsons, with samples of cider champagne and perry champagne.

Messrs. Cocker & Sons, nurserymen, Aberdeen, for an excellent and extensive display of Roses and cut flowers of hardy perennials.

Messrs. Cross & Sons, Glasgow, for an interesting group of well-cropped orchard-house fruit trees, cut flowers, and vegetables.

Mr. Deverill, Banbury, Oxfordshire, for samples of splendidly grown Onions and other vegetables.

Messrs. Dobbie & Co., Rothesay, N.B., for a tasteful display of cut flowers and choice vegetables.

Messrs. Laing & Sons, Forest Hill, London, for a table of tuberous Begonias and other decorative plants.

Messrs. Methven & Sons, nurserymen, Edinburgh, for a well-arranged table of decorative stove and greenhouse plants.

Mr. James Taylor, Bangholm, Edinburgh, for an extensive display of vegetables, as put up in quantities for the Edinburgh market.

The following were awarded Bronze Medals:—

Mr. Rust, The Gardens, Eridge Castle, Sussex, for a fine collection of fruit, comprising ninety dishes Apples, and twenty-four dishes Pears, grown at 400 feet above sea-level.

Mr. Campbell, Blantyre, N.B., for a table of choice florists' flowers.

Mr. Cuthbertson, Rothesay, N.B., for a table of choice florists' flowers.

Messrs. Dicksons & Co., nurseryman, Edinburgh, for an excellent table of miscellaneous decorative plants.

Messrs. Laing & Mather, Kelso, for a display of choice Carnations and other cut flowers.

Messrs. Stuart & Mein, Kelso, for a display of Gladioli and other cut flowers.

Messrs. Cutbush & Son, Highgate, London, for a fine table of miscellaneous decorative plants.

Mr. Hugh Dickson, Belmont Nursery, Belfast, for an exhibit of forty-eight splendid blooms of Rose Mrs. John Laing.

The following were Commended:—

Mr. John Downie, nurseryman, Edinburgh, for a showy table of Tuberous Begonias, &c.

Mr. John Forbes, nurseryman, Hawick, for a table of cut flowers and vegetables.

Mr. Findlay, Markinch, for a collection of new varieties of Potatoes.

Messrs. Thomas Smith & Sons, nurserymen, Stranraer, for a stand of blooms of Rose Mrs. John Laing.

The following received First-class Certificates:—

The Saratoga Packing Company, California, for high quality of sun-dried Prunes, and excellence in curing and packing.

Mr. John Watkin, Pomona Farm, Hereford, for excellence of cider and perry champagne.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending September 19, is furnished from the Meteorological Office:—

"The weather was fine and warm at the commencement of the period, but soon became much cooler, unsettled, and showery in all parts of the Kingdom.

"The temperature has continued above the mean, the excess having ranged from 3° or 4° in most districts, to 1° in the 'Channel Islands.' The highest of the maxima were recorded on the 13th, when the thermometer rose to 83° over Central, S., and E. England, to 80° in 'England, N.E. and N.W.,' and to between 73° and 78° in the 'W. and N. parts of the Kingdom.' The lowest of the minima were registered on the 15th, and varied from 40° in 'England, S.W.,' and 43° in 'England, S.' and 'Scotland, W. and E.,' to 46° in 'Ireland, N.,' and to 52° in the 'Channel Islands.' During the greater part of the period the minima were considerably above the mean for the time of year.

"The rainfall has been rather more than the mean in 'Scotland, N.,' and all the 'W. parts of England,' as well as in 'England, S.' and the 'Channel Islands.' In the 'N.E. and E. of England' the fall has just equalled the mean, while in the remaining districts there has been a deficiency.

"The bright sunshine has been very little prevalent as a whole, but in the 'N. and E. of Scotland' it has been rather in excess of the mean. The percentage of the possible duration was greatest at the eastern stations, and ranged from 31 in 'Scotland, E.' and 29 in 'England, E.' to 19 in 'England, S.W.'"

MARKETS.

COVENT GARDEN, September 24.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET still heavily supplied. James Webber, Wholesale Apple Market.

FRUITS AND VEGETABLES.

STRATFORD: Sept. 23.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned quotations:—Cabbages, 1s. 6d. to 2s. 6d. per tally; Cauliflowers, 1s. to 1s. 6d. per dozen, and 3s. to 6s. per tally; Turnips, 1s. 6d. to 2s. per dozen bunches; Carrots, household, 35s. to 50s. per ton; Mangels, 17s. 6d. to 20s. do.; Swedes, 25s. do.; Onions, German, 5s. to 6s. per bag; do., Oporto, 6s. to 7s. per case; Apples, English, 1s. 6d. to 4s. 6d. per bushel; Scarlet Beans, 1s. to 1s. 6d. per sieve, and 1s. 6d. to 2s. per bag.

SPITALFIELDS: Sept. 23.—Quotations:—English Apples, 2s. to 5s. per bushel; Pears, 1s. to 2s. 6d. per half sieve; Egg Plums, 1s. to 1s. 6d. do.; Orleans do., 2s. to 2s. 9d. do.; Damsons, 1s. 6d. to 2s. do.; Greengages, 2s. to 3s. do.; Cabbages, 1s. 6d. to 3s. 3d. per tally; Cauliflowers, 2s. to 4s. per dozen; Brussels Sprouts, 1s. 6d. to 2s. per half-sieve; French Beans, 4d. to 1s. per bushel; Scarlet do., 6d. to 1s. do.; Greens, 1s. to 1s. 3d. per dozen bunches; Turnips, 1s. 9d. to 2s. 6d. per dozen

bunches; Carrots, 1s. to 2s. 6d. do.; Onions, 2s. to 2s. 6d. do.; Parsley, 1s. to 1s. 6d. do.; Celery, 6d. to 10d. per bundle; Horseradish, 10d. to 1s. 1d. do.; Spanish Onions, 5s. to 6s. per case; Belgian do., 2s. to 2s. 6d. per bag; Leeks, 1s. 6d. to 2s. 6d. per dozen; Endive, 1s. to 1s. 6d. do.; Cos Lettuce, 4d. to 6d. per score; Marrows, 1s. 6d. to 3s. per tally; Spinach, 1s. to 1s. 6d. per bushel; Radishes, 1s. 6d. to 2s. 6d. per tally; Beetroots, 1s. 6d. to 2s. 6d. per dozen bunches.

BOROUGH: Sept. 22.—Quotations:—Cabbages, 2s. to 5s. per tally; Broccoli, 3s. to 4s. do.; Turnips, 1s. 6d. do.; Carrots, 1s. 6d. per dozen bunches; Scarlet Beans, 9d. to 1s. per bushel; French Beans, 1s. do.; English Plums, 2s. to 3s. do.; Apples, 2s. to 4s. do.; and William Pears, 2s. to 5s. do.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

CYPRESSUS KNIGHTIANA, C. COULTEI, and C. URDEANA.—The Editor would feel greatly obliged to any Correspondent who would furnish him with a small scrap of either of these Cypresses without, or preferably with, a cone.

PASSIFLORA EDULIS.—Will some correspondent oblige by sending a few seeds of this to the Editor?

NOTICES TO CORRESPONDENTS.

APRICOTS FROM SEED: S. E. B. File the edges of the stone, but not so as to let moisture into the cavity; lay them in soil in a cold frame, covering them about 6 inches. The soil should not be allowed to freeze. In the spring take them out, and sow in drills on a south border, about as deep as Broadbeans are sown.

CARPET BEDDING DESIGNS: Decorator, Handy-book of the Garden, D. Thomson. Blackwood & Sons, Edinburgh and London.

CUCUMBERS DYING OFF: A. H. W. The loss of the plants is probably due to the presence of eelworms. Kindly send bits of roots and tops.

DECAYED TREE: De la Bere. Support the trunk by props or guy-lines. Remove all dead wood and fungus so far as possible. Swab out the cavity with carbolic acid in strong solution, then fill up with broken bricks or cement. The object is to prevent the entrance of water and of fungus spores so far as possible, and by watchfulness and attention much may be done. Remember the acid is a violent poison and caustic, and be careful in using it accordingly.

FUNGUS ON PEARS: P. The leaves are infested with a species of Gymnosporangium. Better remove all leaves (this will not now injure the trees), and burn them. The fungus passes another (teleutospore) stage on Junipers. Kindly examine any of these trees in your neighbourhood, and if you find a fungus on them, send us specimens.

GERANIUM: F. B. Your specimen had fallen when received here.

LEGAL QUESTION: G. M. We are not lawyers, but we do not believe for one moment that a lady in the condition you mentioned would be any more exempt from the consequences of petty larceny than any other citizen.

LUCERNE: J. S. Sow in April in rows 1 foot apart on light calcareous loam well cultivated. It will yield one cutting the first year, and three and even more the following seasons. A top-dressing of manure should be applied, and weeds kept down. The crop will remain productive for six or seven years if properly cultivated. The roots are very long, fleshy, and deep-rooted, so that the plant does not suffer from drought so much as some plants.

NAMES: P. D. Mdlle. Marie Planchon, that of a fine semi-double white-flowered Azalea indica. Madame J. Wolf is unknown to us.

NAMES OF FRUITS: T. H. 1, Gloria Mundi; 2, Herefordshire Pearmain; 3, Kerry Pippin; 4 and 6, not recognized; 5, Beurré de Capiaumont.—Carter, Page, & Co. 5, Irish Peach; 9, Dumelow's Seedling; 10, Court of Wick; 11, King of the Pippins; 13, Tower of Glamis.—J. Millburn. Plum decayed; Apple not recognized.—J. M. D. 3, Bedfordshire Foundling; 4, Green Balm; 5, Adamsi Pearmain; 8, Devonshire Quarrenden.

NAMES OF PLANTS: H. K. Stanhopea Wardii aurea, Cattleya Warscewiczii (syn. C. gigas), Cypripedium

Godefroya. We fail to trace the slightest departure from the typical C. Godefroya in this.—I. O. Eccremocarpus scaber.—H. H. Rose 1, Marquise Bulbano; 2, too far gone to be recognized.—A. M. Clary (Salvia sclarea).—R. H. B. An Artemisia, closely allied to Tarragon, but not the true form.—W. S. S. 1, Spiraea Lindleyana; 2, Spiraea, next week; 3, next week; 4, Berberia Darwinii; 5, B. empetrifolia, probably; 6, B. stenophylla; 7, B. vulgaris.—A. K. Calycanthus floridus.—G. M. A. 1, Impatiens Roylei; 2, Euphorbia chamaecyparissus; 3, Dipladenia boliviensis; 4, Croton volutum; 5, Campanula, next week; 6, Pelargonium, cannot name; send to some florist.—J. B. 1, Adiantum formosum; 2, Pteris argyrea; 3, Adiantum hispidulum; 4, Selaginella Widenovii; 5, Pteris serrulata cristata; 6, Asplenium fœniculaceum.—J. H. Centradenia rosea, Catasetum macrocarpum. Fruita next week.—M. M. R. An Asclepias, perhaps A. verticillata; but it is impossible to tell from such a scrap.

NOTICE TO LEAVE EMPLOYMENT: T. B. According to your agreement you are a yearly servant, and the proper amount of notice on either side would be 3 months, but in practice it is considered that 1 month is sufficient. Forfeiting wages in lieu of notice on your part would be a matter of arrangement with your employer.

PEAR DISEASED: Subscriber & S. H. & L. H. The upper surface of leaves has been eaten by slugworms (Selandria atra). Give several dustings, of quick-lime or syringe with soft-soap suds and lime water. Remove about 4 inches of surface soil in winter, and burn it to destroy cocoons. The mussel scale (Mytilaspis pomorum) on the branches of one of the specimens must be removed by applying soft-soap suds and sulphur with a stiff brush, repeat till the trees are quite clean.

QUEENSTOWN BOTANIC GARDEN: C. G. H. We are interested in seeing the directors of this establishment complaining, as well they may, of the "foolish regulations" of the Phylloxera Act as carried out at Cape Town. Such regulations are useless, except in the case of Vines, the more so "seeing no restrictions are in force in Natal, the Transvaal, and the Orange Free State."

SITUATION IN A GARDEN WHERE VINES AND PEACHES ARE EXTENSIVELY GROWN: F. B. Advertise.

STOVE TO HEAT A SMALL GREENHOUSE: Melina. Any of the small double cylinder, upright boilers, of simple construction, larger at the bottom than the top, and fed from the top, would answer your purpose. They do not need any brickwork setting, or to stand under cover. See that the ash-pit door acts perfectly; the bars are made to drop, so that clinkers and ashes can be readily removed, and the chimney is provided with a close-fitting damper. These boilers are economical of fuel, and can be made to burn anything, and fast or slow by regulating the ash-pit door and the damper.

TABLE DECORATION: Decorator, Floral Decorations for Dwelling Houses, Annie Hassard, (Macmillan & Co., Bedford Street, Covent Garden, London, W.C.)

TRAM STABLE DUNG: A Young Gardener. The materials consisting of sawdust and horse-droppings, they are not fit for making a Mushroom-bed. If you could sift out the sawdust and use the manure only, mixing it with short stable-litter, it might be employed for the purpose.

TREE SEEDS: B. The catalogue you refer to is that of J. M. Thorburn & Co., New York.

WINTER MOTH AND AMERICAN BLIGHT ON APPLE: F. S. Do not use tar, it is injurious. Put good cart-grease on grocer's butter-paper, use a good daub, and apply not later than the middle of October. The hand must be long enough for the ends to overlap well, fasten these by paste, and secure with piece of bast; apply grease with piece of flat wood. For American blight wash with 2 lb. of soft soap, and 1/2 lb. of sulphur in a gallon of water. Remove rough scaly bark and burn it.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL. 15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE, of Messrs. Methven & Sons, Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 8s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from R. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

SAVE HALF THE COST.

WANTED IMMEDIATELY, Practical WORKING MANAGER, for Fruit Farming.—Apply, giving references, and stating wages, to THOMAS B. DIXON, Wickham Mills, Witham, Essex.

WANTED, a young MAN, as SALESMAN, for Covent Garden Flower Market. Must have good knowledge of Plants, and their value. Only those who can be well recommended need apply.—H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton.

WANTED, a JUNIOR ASSISTANT, used to a smart Counter Trade. One who has some knowledge of the prices of Nursery Stock preferred.—State age, experience, and salary required, to GEO. COOLING AND SONS, Seed Merchants and Nurserymen, Bath.

WANTED, a CLERK, with a knowledge of Seeds, Bulbs, and Plants. Good Correspondent. State age, experience, salary expected, &c., to A. M. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first-rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

GARDENER, age 30.—Mr. J. TOLLETT, Head Gardener to Sir Edward Blackett, Bart., Matfen Hall, Newcastle-upon-Tyne, will be pleased to recommend his Foreman to any Lady or Gentleman requiring a good gardener. Thoroughly understands Early and Late Forcing of all kinds of Fruits, Plants, and Vegetables, and general requirements of a good garden. Character exemplary; sixteen years' experience.

GARDENER (HEAD), and ORCHID GROWER.—Age 31; seventeen years' experience in Orchids, Stove and Greenhouse Plants, early and late Forcing, early Fruit, Flower, and Kitchen Gardens.—WILLIAM LAKE, Quora Lodge, Loughborough, Leicestershire.

GARDENER (HEAD).—J. W. SILVER can most confidently recommend a thoroughly good Man as above. An excellent Plantsman, Fruit Grower, Flower and Kitchen Gardener. Trustworthy and energetic, and highly recommended.—Streatham and Norbury Nurseries, S.W.; and 3, Marlborough Mansions, Victoria Street, Westminster, S.W.

GARDENER (HEAD).—Age 40; thoroughly practical in details of Horticulture. Twenty-four years' experience. Six years in present situation. Highest testimonials.—JOHN KEM-TON, Colworth, Bedford.

GARDENER (HEAD), where two or three are kept, or FOREMAN, in good establishment.—Age 26, married when suited; thirteen years' experience. Well up in Vines, Melons, Cucumbers, Stove Plants, also Chrysanthemums.—H. MASON, The Gardens, Shuckburgh Park, Daventry, Northamptonshire.

GARDENER (HEAD).—Age 31, married, small family; sixteen years' experience in Early and Late Forcing, Fruits, Flowers, and Vegetables. Left through a death. Twelve years' excellent character.—H. LEWIN, 7, Christchurch Road, Hemel Hempstead, Herts.

GARDENER (HEAD), where two or more are kept. Age 35, married. Twenty-two years' experience in good gardens; six years as Head; four years with the late C. Haycock, Barham Court Gardens. Wife laundress; understands Poultry.—S. RICHARDSON, Brook Cottage, Gooe Road, Maidstone Kent.

GARDENER (HEAD), or good SINGLE-HANDED.—Age 29, married; has had a life experience with Glass, Fruit, Flower and Kitchen Garden. Abstainer. Good character.—H. J. SUNNYSIDE, Edinbridge.

GARDENER (HEAD); married, two children, youngest seven years.—A. STRINGER, for the past eleven years Gardener to R. Cudiffe, Esq., St. Melough, Tunbridge Wells, is open to engage with a Gentleman requiring a good all-round man. Highest character. Death of employer cause of leaving.—A. STRINGER, Stoneleigh, Tunbridge Wells.

GARDENER (HEAD).—Practical, married, without family. Required for Cannes, South of France. To live in entrance-lodge. Wife to care for same. Four men employed. Good wages given to a respectable couple. Long and good testimonials as to both character and capability indispensable.—Apply by letter, enclosing copies of testimonials, to B. C. Bolton's Library, Knightsbridge.

GARDENER (HEAD), or GARDENER and FARM BAILIFF, age 29; thinking of marrying as soon as suited.—Advertiser would be glad to hear from any Lady or Gentleman requiring a practical man as above. Fourteen years' practical experience in all branches of Gardening, under Glass and Outside. Could manage a Home Farm if required. Abstainer.—G. H., Messrs. Sutton & Sons, Seed Merchants, Reading.

GARDENER (HEAD WORKING).—Thoroughly understands Houses, Flower and Kitchen Gardens. First-class character. Leaving through Gentleman breaking up his establishment.—G. L., Ridgmont Vicarage, Bletchley, Beds.

GARDENER (HEAD WORKING), age 31.—S. BOLTON, gardener, Braisted Park, can confidently recommend his Foreman, W. Adams, as above; four and a half years in present situation.—Braisted Park, Sevenoaks.

GARDENER (HEAD WORKING), where four are kept; age 28.—MR. HALL, Shiplake Court Gardens, Healey-on-Thames, can thoroughly recommend a reliable man as above.

GARDENER (HEAD WORKING); age 41.—A Gentleman wishes to recommend a man who has been employed by him as Gardener for the last fifteen years. Has a thorough knowledge of Orchids, Stove and Greenhouse Plants, Early and Late Forcing, &c.—Apply, in first instance, to E. S., 20, Argyll Terrace, Bognor, Sussex.

GARDENER (HEAD WORKING), where two or more are kept.—Age 45, married, one little girl. Fourteen years Head in last situation. Thoroughly experienced in Grapes, Peaches, Melons, Cucumbers, Tomatoes, Mushrooms, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Good testimonials.—GARDENER, 11, St. Barnabas Street, Welhamborough.

GARDENER (HEAD WORKING).—Age 38, married; one child, age 17. Energetic, industrious, and trustworthy; seventeen years as Head; first-class grower of Flowers, Fruit, and Vegetables; nineteen months' personal character; nine years' testimonials. Understands Stock.—J. WILLIS, Oxford Street, Bletchley, Bucks.

GARDENER (HEAD WORKING), where three or more are kept.—Age 35, married, one child (age 3); twenty years' experience in all branches of Gardening. Disengaged when suited. Character will bear the strictest investigation.—J. B., 19, Choumont Road, Peckham, S.E.

GARDENER (HEAD WORKING), or good SINGLE-HANDED.—Age 31, will marry when suited. A Lady wishes to recommend her present gardener to any Lady or Gentleman requiring a perfectly trustworthy, honest, and sober man, as above. Wages, 6s. per week, with Cottage or Lodge found free. Wife would manage small Dairy if required.—Address, in first instance, to H., Mrs. Frost, Stationer, 62, High Street, Wimbledon, Surrey.

GARDENER (HEAD WORKING), where three or more are kept.—Age 32, two children; thoroughly experienced in all branches. Excellent character from present and previous employers. Seven years as Head with present employer.—W. DOUST, Lamb-rhurst, Kent.

GARDENER (HEAD WORKING), in a good establishment.—Age 31, married when suited; life experience; to any Nobleman, Lady, or Gentleman requiring a first-class man in every respect. Highest reference as to ability and trustworthiness.—H. U., Messrs. Sutton & Sons, Seed-men, Reading.

GARDENER (HEAD WORKING).—Age 39, married; Abstainer. A thoroughly good practical and competent Gardener. Twenty-three years' experience in growing Grapes, Peaches, Melons, Cucumbers, Tomatoes, Mushrooms, Stove and Greenhouse Plants, Orchids, Flower and Kitchen Gardening. Early and Late Forcing. Highest references.—GARDENER, Mr. Ronald's, Seedsman, South Street, Chichester.

GARDENER (HEAD WORKING), who can be highly recommended, desires re-engagement.—Age 29, married, two in family; experienced in Stove and Greenhouse Plants, Orchids, Vines, Chrysanthemums, Flower and Kitchen Garden. Five years' good character. Abstainer.—F. NEGUS, Cowling Street, Watlington, Oxon.

GARDENER (HEAD WORKING).—Age 30, married, no family; thoroughly experienced in all branches, under Glass, and Outside, Forcing and Propagating, Vegetables, Landscape Work, &c. Well educated. Willing to go abroad.—H. H., 14, Shoreham Road, Wortley, Leeds.

GARDENER (HEAD WORKING).—Age 30, married; sixteen years' experience in Fruit and Plant Growing under Glass, Flower and Kitchen Garden. Six years in present situation as above.—C. MUSK, The Lodge, Seafeld Park, Farnham, Hants.

GARDENER (HEAD WORKING); age 29, single.—MR. SCOTT, The Holme, Regent's Park, N.W., can with confidence recommend his Foreman to any Lady or Gentleman requiring a good practical all-round man as above. He has been with him for the past five years.

GARDENER (HEAD, or SINGLE-HANDED).—Age 36, married; twenty-two years' experience with Glass, Fruit, Flowers, and Vegetables. Good character.—GARDENER, Wickham Place, near Witham, Essex.

GARDENER (SINGLE-HANDED).—Age 28, single; seven years' good character.—A. WHITING, 3, Stafford Cottages, Ham, Surrey.

GARDENER (SINGLE-HANDED).—Good practical experience of Plants, Fruit, Flower, and Kitchen Gardening. Good references from last employers.—G. W., Mrs. Wiggins, Lockfield Road, Isleworth.

GARDENER (SINGLE-HANDED), or where another is kept.—Age 30, married, one child; practical experience in all branches.—A. P., Lock's Cottages, Ashford Road, Staines, Middlesex.

GARDENER (SINGLE-HANDED, or other-wise).—Age 30, married, one child; sixteen years' experience. Disengaged. Excellent character and testimonials.—M. C., 2, Norfolk Villas, Saunders' Road, Plumstead, S.E.

GARDENER (SECOND), Inside and Out, where three or four are kept.—Age 23, single; ten years' experience. Two and a half years' good character.—GEORGE MERCER, Hartmore, Godalming, Surrey.

GARDENER (SECOND or good SINGLE-HANDED).—H. YOUNG, late Second at the Grange, formerly Foreman, Eastwick Park, seeks engagement as above. Abstainer.—23, Morland Road, Sutton, Surrey.

GARDENER (SECOND), where two are kept.—Age 20, single; three years' good character. Well up in his work.—G. R., Woodfield House, Oving, Chichester.

GARDENER (SECOND), under Glass.—Age 23. Good references from last employer.—T. J., Wellbrook Cottage, Farnborough, Kent.

SEED TRADE.—Situation wanted by a young man (age 18), as ASSISTANT, in a good house. Two years' reference.—WOOD, 5, Edgbaston Road, Birmingham.

HOLLOWAY'S PILLS.—Nervous Irritability.—No part of the human machine requires more constant supervision than the nervous system, for upon it our health, and even life, depends. These Pills strengthen the nerves, and are the safest general purifiers of the blood. Nausea, headache, giddiness, numbness, and mental apathy yield to them. They relieve in a summary manner those distressing dyspeptic symptoms, stomachic pains, fulness at the pit of the stomach, abdominal distension, and regulate alike capricious appetites and confined bowels—the commonly accompanying signs of defective or diminished nerve tone. Holloway's Pills are particularly recommended to persons of studious and sedentary habits, who gradually fall into a nervous and irritable state, unless some such restorative be occasionally taken.

“A LADY WANTS NO OTHER COSMETIC
THAN

Pears'
soap

But one caution is absolutely necessary from a hygienic point of view. It is a notorious fact that Pears' Soap is sold at a very small profit (I think not more than about one half-penny per tablet), on the wholesale cost price, consequently, one or other of the many soaps in the market (on the sale of which a profit of threepence or fourpence per tablet may be made), is sometimes either substituted or recommended to the buyer as 'just as good,' 'equally pure,' &c., &c., &c., the real object of the dealer, of course, being simply to obtain the greater profit by the sale of the inferior article which he recommends or attempts to substitute. Patients should, therefore, insist on having Pears' Soap when they ask for it, otherwise they may find that, instead of being served with a Genuine Soap, they have an article of most inferior quality foisted upon them; something worse than worthless, calculated only to set up **HEAT, REDNESS, IRRITATION**, and general unsightliness of the skin."

From "HYGIENE OF THE SKIN," by Mr. J. L. MILTON, Senior Surgeon,
St. John's Hospital for the Skin, London.

PEARS' SOAP makes the Hands white and Fair,
the Complexion bright and clear, and the Skin soft and
smooth as Velvet.

The GARDENERS' CHRONICLE

ESTABLISHED 1841. No. 2649.

No. 249.—VOL. X. { THIRD }

PROTHEROE AND MORRIS are instructed by Mr. John Charlton to SELL by AUCTION, on the Premises, The High Brooms Nurseries, Tunbridge Wells, on FRIDAY NEXT, October 9, at 12 o'clock precisely, a quantity of thriving and well-grown NURSERY STOCK, including a great assortment of Coniferae and Evergreen Shrubs, 2000 American Arbor Vite, suitable for hedges; 750 Thuja Lobbi, 600 Cupressus Lawsonii, various sizes; 500 Laurels of sorts, 500 Standard and Dwarf Roses of the leading kinds, 900 choice Herbaceous Plants, in best named kinds; Flowering Shrubs, Hardy Climbers, Red and Black Currants, &c., specially lotted to suit private buyers.
May be viewed any day prior to Sale. Catalogues may be had on the premises at the Seed Warehouse, 37, Ye Pavilions, Tunbridge Wells; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Woking.
UNUSUALLY IMPORTANT SIX DAYS' SALE of exceptionally well-grown NURSERY STOCK, growing on portion of the land required for other purposes, in the finest possible condition for transplanting, and embracing the most important lot of stock offered for Auction for many years, the quality of which is unsurpassed in the Trade.
GREAT UNRESERVED SALE by order of the Trustees of the late Mr. George Jackman.
MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the Woking Nurseries, Woking, Surrey, on MONDAY, October 12, and FIVE FOLLOWING DAYS, at 12 o'clock precisely each day, several acres of unusually well-grown NURSERY STOCK, comprising 10,000 Conifers, 3 to 7 feet; thousands of smaller Evergreens and Conifers; 1500 Picea Nordmanniana and Pinus; 4000 Box, in variety, 1 to 4 feet; 1000 Aranea imbricata, 1 to 3 feet; 3000 Aucubas, in variety, 1 to 4 feet; 2000 Laurels of sorts, 2 to 5 feet; 2000 English and Golden Yews, 2 to 7 feet; 1000 Gold, Silver, and Green Hollies; 5000 deciduous Flowering Shrubs; 5000 named Rhododendrons, 1 to 3 feet; 2000 Limes, 5 to 10 feet; 1000 Purple Beech, 6 to 10 feet; 1000 Maples, in variety, 7 to 10 feet; Forest Trees in great quantities; 60,000 common Ash, 2 to 5 feet; 50,000 Quick, 1 to 2 feet; 10,000 English and Turkey Oaks, 2 to 5 feet; 6000 English Laurels, 3 to 5 feet; a splendid collection of Ornamental Trees for park and avenue planting, 10 to 20 feet; 5000 Standard and Feathered Plums; Damsons, Quinces, &c.; 2000 Standard and Feathered Flowering Almonds, Peaches, and other Stock.
Goods can be transmitted from Woking Railway Station to all parts without change of truck.
The Auctioneers have personally visited the nurseries and desire to call attention of intending purchasers to this Sale, as it is undoubtedly the most important Auction of Nursery Stock that has been held for many years.
An inspection will well repay a visit by those contemplating planting during the season.
May be viewed. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Tuesday, October 13.
IMPORTANT SALE of a celebrated FRENCH COLLECTION formed by the—
COUNT HORACE DE CHOISEUL. Without Reserve.
MESSRS. | Oncidium Ornithorhynchum album | Oncidium incurvum album |
| Epidendrum Walisi | Ada aurantiaca |
| Batemannia Burtii | Laelia Wyatiana |
| Cologyne cristata lemoniaea, splendid specimen | Cattleya Mendelii, including many fine forms |
| Cypripedium hirsutissimum, splendid specimen | „ Skinneri ocellata |
| Lycaste Skinneri alba, several plants | „ exoniensis |
| Odoctoglossum Rossi Amesianum | „ gigas |
| „ uro-Skinneri, splendid specimen | „ Gaskelliana var. Dalhousiana |
| „ ramosissimum | Vanda Kimballiana |
| Cattleya labiata, autumn-flowering variety, true | „ Sanderiana, several plants |
| Anthurium Scherzerianum, Lake House variety, grand plant | Saccolabium Heathii, extremely rare |
| | Cologyne cristata, Chatsworth var. |
| | &c., &c., &c. |

A MOST BEAUTIFUL and LARGELY-FLOWERING VANDA CERULEA, a UNIQUE VARIETY. On view mornings of Sale, and Catalogues had.

Dutch Bulbs. Dutch Bulbs.
SALES EVERY MONDAY, WEDNESDAY, and SATURDAY, and frequently on THURSDAY.

In Large and Small Lots, to suit all Buyers.
MR. J. C. STEVENS will **SELL** by AUCTION at his Great Rooms, 38, King Street, Covent Garden, every MONDAY, WEDNESDAY, and SATURDAY, and frequently on THURSDAY, at half-past 12 o'clock precisely each day, first-class consignments of choice named HYACINTHS, TULIPS, CROCUSES, NARCISSUS, and other BULBS, arriving Weekly from well-known Farms in Holland. On view mornings of Sale, and Catalogues had.

Annual Sale of Nursery Stock.
THE DORKING NURSERIES—five minutes' walk from Dorking Station, L. B. & S. C., and Box Hill, S. E. Railway.

MESSRS. WHITE AND SONS are instructed by Messrs. Ivery & Son, to **SELL** by AUCTION, as above, on FRIDAY and SATURDAY, October 9 and 10, 1891, at 12 o'clock precisely, a great variety of THRIVING YOUNG NURSERY STOCK (in first-rate condition for transplanting), all having been moved during the last two years) including Aucubas, 1 foot to 2 feet; Box, Hollies, Portugal Laurels, Garden and Common Yews, 2 feet to 4 feet; Flowering Shrubs, in variety; Thuis of sorts; Abies Douglasii, Thujaopsis, Retinoparas, and Cupressus, of sorts, 2 feet to 6 feet; Ficus and Piceas, in varieties; Spruce and other Firs, of various heights; Cedars, Junipers, Araucarias, &c., and thousands of Quicks and Common Laurels, 2 feet to 5 feet; Acer variegata, Thorns, of sorts; Catalpas, Chestnuts, &c. Also a quantity of Ornamental Trees, Standard and Pyramid Apples, Pears, and Plums.

Catalogues may be obtained at the Inns and Hotels in the neighbourhood; at the place of Sale; and of the Auctioneers, Land Agents, and Valuers, High Street, Dorking, and on Fridays at Leatherhead.

THURSDAY NEXT.

CATTLEYA LABIATA VERA,

Semi-established in pans, and rooting freely.

SWAINSON'S OLD LABIATA, NOT GARDNER'S LABIATA.

CATTLEYA SANDERIANA,

Must not be confused with C. gigas Sanderiana.

CATTLEYA SPECIES,

Found in the Chryso-toxa district.

CATTLEYA GODSEFFIANA,

Absolutely new.

CATTLEYA,

THE NEW LABIATA (?).

MR. J. C. STEVENS has

received instructions from Mr. F. SANDER, St. Albans, to **SELL** by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, October 8, at half-past 12 o'clock precisely:—

THREE HUNDRED GRAND PLANTS,

Selected, semi-established, of the true old autumn-flowering labiata. Imported four months ago, and are simply in splendid order and condition for blooming strong and fine.

Every plant guaranteed true, and all are unflowered in Europe.

CATTLEYA SANDERIANA,

Not gigas Sanderiana.

This is perhaps the finest Cattleya extant, and is absolutely new.

Natives say that the blooms are nearly a foot across.

CATTLEYA SPECIES.

From the same district as C. chryso-toxa. Flowers warm pink, with enormous crimson and gold labellums, section of Hardyana, Byrkeley Lodge var., shown at Drill Hall; Missiana, Young's, and Statter's vars.—rarely has there been seen a Cattleya so promising.

CATTLEYA GODSEFFIANA.

It must not be supposed from the habit of this Cattleya that it resembles C. Skinneri.

"It is an absolute new species."

Flowers round, 4 inches across, mauve sepals and petals, and striped lip.

CATTLEYA,

THE NEW LABIATA?

From a new locality, where Orchids have never before been gathered. Free flowering, and very showy and large.

SPRING-FLOWERING CATTLEYAS.

SUMMER-FLOWERING CATTLEYAS.

AUTUMN-FLOWERING CATTLEYAS.

WINTER-FLOWERING CATTLEYAS.

The following are a few of the kinds represented in the Catalogue:—

- | | |
|-----------------------------|----------------------|
| Cattleya Mendelii var. from | Cattleya Bowringiana |
| „ Cayaxia | „ Mossie |
| „ Triaca | „ Perevaliana |
| „ chry-otoxa | „ erii |
| „ Schrodera | „ Wiscowiczii |
| „ amethystoglossa | „ maxima peruviana |
| „ citrina | „ Walkeriana |
| „ dolosa | „ Lawrenceana |
| „ Eblorada | „ Gaskelliana |
| „ granulosa | „ crispa |
| „ Schofieldiana | „ velutina |
| „ crocata | „ autumnalis |
| „ guatemalensis | „ bulbosa, &c. |

On view morning of Sale, and Catalogues had.

Notice.

HIGHLY IMPORTANT FIVE DAYS' UNRESERVED SALE of beautifully grown NURSERY STOCK, all well-rooted, and carefully prepared for removal, and specially selected for the Sale. By order of Messrs. Isaac Matthews & Son.

MR. JOHN OAKS, Ash, will SELL by AUCTION, on the Premises, at the far-famed Bagnall Tite Oaks and Milton Nurseries, on OCTOBER 21 and FOLLOWING DAYS, without reserve, several Acres of NURSERY STOCK, grown to the highest perfection. The Nurseries are in an extremely cold situation, and all the trees are perfectly hardy, and grown to the highest perfection. Extremely well-rooted and well-furnished Hodgen's, Common, Maderiensis, Silver, and Gold Hollies in variety, 100,000 Rhododendrons various, a large quantity of all leading varieties of Conifers, Evergreens, &c., suitable for Ornamental Planting, Parks, Cemeteries, Pleasure Grounds, &c. Large quantities of Thorn, Quick, Ash, Elm, Alder, Privet, Austrian Pines, Spruce Fir, Chestnuts, Willows. All other trees for Woods and other plantations.

Catalogues seven days prior to Sale on application to the Nurseries, Milton, Stoke-on-Trent. Milton is the nearest station, L. & N. W. Railway. All trains met.

King's Acre Nurseries, near Hereford.

IMMENSE SALE OF UNUSUALLY WELL-GROWN NURSERY STOCK. Included therein: 6000 STANDARD, PYRAMID, and TRAINED FRUIT TREES, without the Least Reserve. As a portion of the Land will shortly be offered for Sale for Building purposes, it is absolutely necessary to clear the Ground.

ALEXANDER, DANIEL, SELFE, AND CO. will **SELL** by AUCTION, on the Premises as above, on TUESDAY, WEDNESDAY, and THURSDAY, October 20, 21, and 22, 1891, at 11 for 12 o'clock precisely, several Acres of first-class NURSERY STOCK.

Further Particulars in future Announcements, but the Stock may be Viewed at once.

CATALOGUES may be obtained at the Nurseries, or of the Auctioneers, Corn Street, Bristol (and 31, Old Jewry, London, E.C.).

WANTED, a quiet, comfortable HOUSE, Furnished, or Unfurnished, with from 10 to 30 Acres of light FARM LAND, suitable for a POULTRY FARM. Ornament no object. Heath country in Surrey preferred.

Apply, by letter, R. Mr. Lord, Stationer, 12, Gloucester Road, South Kensington, S.W.

WANTED TO RENT, on LEASE, a good DWELLING-HOUSE, with GLASS, and about an Acre or more of Land.

BLUNDELL, Florist, Enfield.

FOR DISPOSAL, an old established NURSERY, FLORIST, and SEED BUSINESS, about 20 miles from London. Nursery 2 acres, well-stocked; three Houses, Pits, Potting-sheds, &c., Dwelling House, and Shop. On Lease. Rent moderate.

Particulars on application to H. J., Gardeners' Chronicle Office, 11, Wellington Street, Strand, W.C.

TO BE SOLD.—Navarino Freehold Property, Worthing. TWO HOUSES, facing the Sea, large Gardens enclosed with high wall running south to north, planted with choice Fruit Trees; splendid soil, suitable for Grapes and Tomatoes. Room for 500 or 600 feet of glass. Also THREE COTTAGES.

Apply, W. MITCHENER, Navarino, Worthing.

To Seed Merchants and Others.

TO BE SOLD, the HOUSE, SHOP, WAREHOUSE, and PREMISES lately occupied by the late Mr. William Miller, deceased, situate at East Herrington, near Sunderland, and used by him as a Seed, Grain, and Oilcake Merchant, together with the Goodwill of the Business.

If not Sold, a suitable tenant would be accepted. Cards to View, and further particulars, may be obtained of WILLIAM BELL AND SONS, Solicitors, 23, Lambton Street, Sunderland.

Highgate.

TO BE SOLD or Let.—Excellent Detached RESIDENCE, with Stabling for 4 horses; 2 Cottages, and CHARMING GARDENS, including Tennis and other Lawns, Ornamental Water, small Orchard, Vineries, Peach House, Orchard House, &c.—in all an Acre and three-quarters; 10 Bed and Dressing-rooms, Bath-room, 3 Reception-rooms, Fernery, and well lighted Studio and buildings; more land available.

Messrs. PRICKETT AND ELLIS, Highgate; or Messrs. DEBENHAM AND CO., 80, Cheapside. (45502.)

To Nurserymen, Market Gardeners, and Florists.
TO BE LET, or SOLD (through the death of the Tenant), BUSINESS PREMISES, as a Going Concern, consisting of a House and Shop, four Greenhouses, and from 2 to 3 Acres of Land, as a Nursery, in the town of Abergweny, near the London and North-Western Railway Station. A thriving and profitable business has and is being carried on. Apply to EVAN JONES, Mardy Park, Abergweny; or, T. GLASBROOK RICHARDS, Solicitor, Swansea.

FOR ORCHIDS, and GARDENERS,

to Grow Them, apply to SANDER'S, St. Albans. The finest stock of Orchids in the World. 30 minutes from St. Pancras.

Fifty Nurseries, Market Gardens, Florist and Seed BUSINESSES to be DISPOSED OF.

MESSRS. PROTHEROE AND MORRIS' HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained, gratis, at 67 and 68, Cheapside, London, E.C.

The Special Culture of Alpine Plants and Hardy PERENNIALS.

M. PRICHARD, Riverslea Nursery, Southbourne, Christchurch (many years Foreman at Paul & Son's, Broxbourne Nursery), begs to intimate that he has still time on hand for which he is disengaged during the coming season, in the formation of Rock Gardens, for the successful growth of Alpine Plants, &c., combined with economy and picturesque. Absolute personal superintendence.

Veitch, British Queen, Dr. Hogg, Albert (fine, new, late), Elton, Eleanor, Waterloo, Loxford, Jubilee, latest of All, and 150 best sorts, true to name. Lists free. T. LAXTON, Seed Grower, Bedford.

Many Acres of Lilies of the Valley! T. JANNOCH, Largest Grower of LILIES OF THE VALLEY in the Kingdom, offers 3-year-old flowering Crowns for forcing, and 2 and 1-year old Crowns for planting out, of unsurpassed quality. Hundreds of testimonials. Time of sending out, November 1 to May 1. Prices and terms on application. T. JANNOCH (Lily of the Valley Grower by special appointment to H.R.H. the Prince of Wales), Dersingham, King's Lynn, Norfolk.

EXHIBITIONS.

ROYAL AQUARIUM, WESTMINSTER, OCTOBER 14, 15 and 16. GREAT FRUIT SHOW and COMPETITION for Messrs. SUTTON AND SONS' SPECIAL PRIZES for VEGETABLES. Schedules of Prizes on application to Mr. RICHARD DEAN, Superintendent, 42, Ranelagh Road, Ealing, W.

UNITED HORTICULTURAL BENEFIT and PROVIDENT SOCIETY. The ANNUAL DINNER will take place on THURSDAY, October 15, 1891, at 5.30 P.M., at the Cannon Street Hotel, E.C. GEORGE A. DICKSON, Esq., of Chester, will preside. Tickets, 5s. each, may be had of the Secretary, W. COLLINS, 9, Martindale Road, Balham, S.W.

ROYAL BOTANICAL and HORTICULTURAL SOCIETY of MANCHESTER. A GRAND EXHIBITION of HARDY and OTHER FRUITS will be held on the 20th, 21st, 22nd, and 23rd inst. For Schedules, &c., apply to the undersigned. BRUCE FINDLAY, Royal Botanic Gardens, Manchester.

ROYAL BOTANIC SOCIETY of MANCHESTER. A FRUIT CONFERENCE will be held in Manchester on the 21st and 22nd inst. The Right Hon. the EARL of DERBY will Preside on the First Day, and Alderman Sir JAMES WHITEHEAD, Bart., on the Second Day. The Subjects to be brought before the Conference are published in the Schedule. BRUCE FINDLAY, Secretary.

WANTED.

POLEMONIUM CERULEUM, STRAWBERRY, "Latest of All." "Sir Harry." "Black Prince." "President." FUSCHIA, "Annetti." "Mrs. Marshall." TROPEOLUM, "Canariense Improved." CALCEOLARIA CUTTINGS. GERANIUM, "HENRY JACOBY."

H. CANNELL & SONS, SWANLEY.

Landscape Gardening. ARTHUR M. KETTLEWELL (Author of the Theory and Practice of Landscape Gardening), brings experienced and careful personal attention to the artistic arrangement of Ornamental Grounds, Parks, Gardens, &c. Excellent testimonials from former patrons. Address, Titley, R.S.O., Herefordshire.

THE TOWER FURNISHING COMPANY (Limited), SUPPLY GOODS ON HIRE, direct from the Manufacturers; one, two, or three years' Credit without Security. Purchaser have the choice of 100 Wholesale Houses. Call or write for Prospectus. Address, SECRETARY, 43, Great Tower Street, E.C.

ROSES! ROSES!! ROSES!!!—The best and cheapest in the world. 40 Choice Perpetuals for 21s.; purchaser's selection from 400 best varieties; Catalogues free on application. Twelve Acres of Roses. 100,000 grand plants to select from; plant now. JAMES WALTERS, Rose Grower, Exeter.

The Best Present for a Gardener. VINES and VINE CULTURE. The most complete and exhaustive Treatise on Grapes and their Culture ever published. New Edition. Price 5s., post-free, 5s. 6d. A. F. BARRON, Royal Horticultural Society, Chiswick.

STANDARD BAY TREES.—To Offer, very cheap, several large Trees, 4 feet 6 inches to 5 feet through, and 9 to 10 feet high, in tubs; also some Pyramids, well furnished, all in perfect condition.—Particulars at, or may be seen by applying to the GRAND FLORAL DEPOT, 283, Regent Street, W.

FOR SALE, a large quantity of DOUBLE WHITE NARCISSUS, splendid for Cut Blooms, large pure white flowers, 12s. per bushel. SANDYS, 93, Acre Lane, Brixton.

GLASS! CHEAP GLASS! In Stock Sizes. 15-oz., per 100 ft., 9s. 6d. (12x10, 18x12, 18x14, 24x14 21-oz., " 13s. 0d. 14x12, 20x12, 18x16, 24x16 16x12, 16x14, 20x16, 24x18, &c. Heating Apparatus and Gardening Appliances at low prices. Flooring, at 5s. per square; Matching, at 3s. 6d.; 2x4, at 1/2 per foot run. Greenhouse Bars, Mouldings, Doors, Paints, Ironmongery, &c. CATALOGUES FREE.

THE CHEAP WOOD COMPANY, 72, BISHOPSGATE STREET WITHIN, LONDON, E.C. To Nurserymen, Seed Merchants, and Florists. J. BLACKBURN AND SONS are offering Archangel Mats lower than any other house in the trade; also Petersburg Mats, and Mat Bags, Raffia Fibre, Tobacco Paper, and Shading. Prices free.—4 and 5, Wormwood Street, E.C.

SIX CABINET PORTRAITS, 3s.; three for 2s. Twelve Carte Portraits, 2s. 2d.; six for 1s. 4d. Eight-inch Enlargement, 3s.; three for 6s. Stamp size, 2d for 1s. 6d.; 100 for 3s. 6d. Send Carte or Cabinet and Postal Order, and in about ten days you will receive Highly-finished Copies, with Original.—FRANCIS AND CO., 29, Ludgate Hill, London.

B.S. WILLIAMS & SON'S

AUTUMN, WINTER FLOWERING,
AND
FORCING PLANTS.

Prime Quality, in Splendid Condition,
Now Ready for Delivery.

- ACACIA ARMATA, covered with buds.
- ANDROMEDA FLORIBUNDA, extra fine.
- AZALEA INDICA, finest kinds for forcing.
- .. MOLLIS, loaded with buds.
- .. GHENT VARIETIES, very fine.
- BEGONIAS, winter-flowering.
- BOUVARDIAS, crowned with flower-buds, including the latest novelties.
- CAMELLIAS, fine sorts, well set with flower.
- CARNATIONS, tree varieties, loaded with buds.
- CYCLAMEN, our superb Giganteum strain.
- DAPHNE INDICA RUBRA.
- DEUTZIA GRACILIS, splendidly set with flower buds.
- .. CRENATA, FL-PL., grown in pots.
- .. PRIDE OF ROCHESTER, from open ground.
- EPACRIS, of sorts, very fine for winter.
- EPIPHYLLUMS, many fine kinds.
- ERICA HYEMALIS, GRACILIS, CAFFRA, &c.
- GARDENIAS, best sorts, well bud led.
- KALMIA LATIFOLIA, covered with flower buds.
- LAURUSTINUS, dwarf stems, compact heads.
- LILIUM CANDIDUM, English grown, for forcing.
- .. HARRISI, extra strong, from America.
- PRIMULA SINENSIS ALBA PLENA, in fine varieties.
- .. RUBRA PLENA, in fine varieties.
- SOLANUM HYBRIDUM, Empress, and other kinds.

SANDER'S GREAT CATTLEYA SALE.

SWAINSON'S OLD LABIATA,
(NOT GARDNER'S LABIATA).

Mr. J. C. STEVENS

KING STREET, COVENT GARDEN, W.C.,

Will **SELL** by **AUCTION** on **THURSDAY NEXT**,
October the 8th,

**300 GRAND PLANTS, SELECTED, SEMI-ESTABLISHED,
TRUE, OLD, AUTUMN-FLOWERING LABIATA.**

Imported four months ago. They are in simply splendid order and condition for blooming; strong and fine; growing in pans, and rooting freely; every plant guaranteed true; and all are unflowered in Europe.

CATTLEYA SANDERIANA

Must not be confused with *C. gigas* Sanderiana, but is probably the finest *Cattleya* extant.

ABSOLUTELY NEW.

Collector saw no flowers, but natives state flowers are nearly a foot across. It is from a totally new district.

CATTLEYA SPECIES,

District of Chrysotoxa; flowers warm pink, with enormous crimson and gold labellums; section of Hardyana, Byrkley Lodge var., shown at Drill Hall; Massaiana, Young's, and Statter's vars.—rarely has there been seen a *Cattleya* so promising.

CATTLEYA GODSEFFIANA.

It must not be supposed from the habit of this new *Cattleya* that it is in any way like *C. Skimmerii*, but it is an absolutely new species; flowers round, 4 inches in diameter; mauve sepals and petals, and striped lip.

ALSO THE NEW LABIATA ?

Found in a new locality, growing principally on rocks and low trees, over small streams, and flowering very freely in August and September; flowers very large and showy. No Orchids have ever before been gathered in this part of Brazil. (Not guaranteed new).

&c., &c., &c.

ROYAL HORTICULTURAL SOCIETY.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 3, 1891.

KNIPHOFIAS.

THIS noble genus, which for many years was treated with comparative neglect, is now receiving a greater amount of attention than has been bestowed upon it hitherto, although for some time past these plants have attracted the care and attention of some of our most eminent horticulturists and hybridists. Generally speaking, however, these beautiful subjects have not received that amount of attention they are fairly entitled to, neither are they to be found planted to anything like the extent that they ought to be, when we take into consideration the old and distinct effects that are to be obtained from well and judiciously-placed belts and groups. The forms now in cultivation are so varied in stature, form, and colour that suitable subjects can be found amongst them for almost any site or position, be it either the rock, flower, or wild garden.

The genus has been known to botanists for nearly a hundred years (Moench, 1794), but it was not till 1848 that the typical *K. Uvaria*, once called *Tritoma*, was cultivated as a hardy plant at Kew, and seedlings more or less varying from this type are still to be found as the sole representatives of the genus in the majority of gardens; while in some parts of the country, forms that are evidently seedlings of *K. Uvaria* crossed with *sarmentosa* are the most abundant. These latter, I have noticed, are invariably hardy, perpetual flowering, and well adapted to give character and colour in the most effective manner late in autumn, when all else in the garden has been cut down by frost, or injured by wind and rain. A very striking combination may be obtained by planting these "Torch Lilies" in quantity interspersed with *Galtonias* and *Hya-cinthus candicans*. The writer, some years ago, planted a few thousand of each of these plants in an undressed piece of pleasure ground in the neighbourhood of a small lake in the manner indicated, with the happiest of results; the situation chosen was naturally drained, and stood well above the water. The preparation was simple and inexpensive; large broad belts were deeply dug, well manured, and allowed to settle during the autumn and winter. In March the *Galtonias* were planted, while the *Kniphofias* were turned out in June, both sets of plants were small, all having been raised from seed sown the previous year; about one-half of each flowered the succeeding autumn, and ever since this "Cape Colony" has increased in interest and beauty.

It must, notwithstanding, be clearly understood, that although the species of *Kniphofia* are readily propagated from seed, it is only the most clearly

defined species, such as *K. caulescens*, *K. Quarantiniana*, *K. Northiæ*, *K. pallidiflora*, &c., that can be depended upon to retain their typical form when raised or produced from home-grown seed. I believe, however, that collected seed of such forms as *K. natalensis* and *K. MacOwani* will produce plants of true type, while considerable variation will be found amongst the progeny of the same species seeding in this country. I should, therefore, strongly advise those about to form collections, or cultivators adding fresh varieties to those already in their gardens, to procure specimens from the most reliable sources, insisting upon being supplied with plants propagated by division only from authentic stock. As an illustration of the necessity for taking this precaution, I may mention that, when forming a collection of these plants in my old garden at Ledbury, I had amongst others procured duplicate plants of *K. nobilis* and *K. Saundersii*, two very distinct forms, from half-a-dozen of the most reliable sources. In every instance these plants varied more or less, and none of them agreed with the undoubted typical plants for which I was indebted to the kindness and generosity of that prince of horticulture, Herr Max Leichtlin, the same variation occurring in the case of the hybrid *K. corallina*: and, in fact, all the forms that I tested in the manner indicated. At the same time, it is just possible that something very distinct and beautiful may be acquired amongst seedlings if obtained from a good collection. One of the finest forms in cultivation is a seedling originally found amongst a batch of seedlings of *K. maxima* in Messrs. R. Smith & Co.'s nurseries, Worcester, where these plants have received very considerable attention for a long time at the hands of that very able botanist and plantsman, Mr. S. Appleton. The form I allude to is now well known under the name of *K. maxima globosa*. Herr Max Leichtlin has given a great deal of attention to this genus, he having raised and distributed a number of very beautiful and distinct hybrids, which, when more plentiful and better known, will, I have no doubt, become exceedingly popular, especially in those gardens where the best of hardy plants find place and attention.

Ireland, it would appear, can lay claim to possess the finest collections of *Kniphofia* in Britain, notably those at Belgrove and Glasnevin, and at Mr. T. Smith's, Daisy Hill, Newry; this latter is wonderfully complete and accurate, being, perhaps, the largest and most representative trade collection in Europe. The fact of such a distinguished horticulturist as Mr. Gumbleton having bestowed considerable attention upon these plants for many years, acquiring, as he has done, all forms, be they species, varietal forms, or hybrids, from every available source, is sufficient evidence not only of the intrinsic beauty and interest these plants possess, but that, like other things, the collection to be found in the garden at Belgrove is unique, and quite up to date, both from the botanist's and gardener's standpoint.

In planting or forming groups of these Torch Lilies, care should always be taken to select warm, dry, well-drained, sunny situations as sites. Coming, as most of them do, or as at least the species originally did, from the higher well-drained regions of the African continent, the whole race naturally dislike anything like stagnant moisture about the roots or collar. By way of preparation, the ground should be worked to a good depth, and liberally enriched with thoroughly decayed manure, and the addition of

some old turfy loam: if the soil should be of a stiff retentive character, the admixture of road drift or silver sand and a little leaf-soil will be a material advantage.

I found it a good plan to place the plants almost on the surface of the prepared sites, and afterwards form a mound round each plant with suitable compost. In this way I was able to spread out the roots—which are usually of considerable length, especially if the plants are, as they ought to be, turned out of pots—equally over the space allotted to each occupant. This mode of planting also affords an excellent opportunity for rapid drainage. Immediately after the operation of planting has been completed, the plants should be surrounded and surfaced with a

slates placed on bricks or other supports, so as to allow a free circulation of air, but at the same time to throw off rain and snow from the crown or centre of the root-stock.

When hunting up the plants forming the collection at Ledbury, I always secured what I wanted where and when I could, but experience showed that the correct time to divide and propagate is immediately after the plants have flowered. If a plant is to be increased to any extent let it, at the proper time, be taken bodily up, be it large or small. Split it through, then carefully work off with knife and fingers, each crown separately, reducing the tops to a convenient height, and pot up in sandy loam in pots according to the size of the crowns; afterwards the
